Gosling, Clark & North	2 35 19
Hazard, H. M. Sears	2 38 00
Tunipoo, J. L. Brewer	2 45 43
Spindrift, W. S. H. Lothrop	Withdrew.

21ft. Class.

Snipe II., Boardman Bros.	2 13 30
Bud, S. N. Small	2 18 02
Tacoma, Elmer Prior	2 40 46
Fesit, N. R. Blaney	2 43 37

18ft. Class.

Circe, F. L. Pigeon	2 20 28
Duchess, C. D. Mower	2 26 28
Vamoose, R. M. Benner	3 40 00

The judges were: G. W. Mansfield, A. G. Wood, A. H. Higginson and W. A. Tucker.

There was so little wind in the afternoon that the second race was postponed to Monday afternoon, the race for the Cronhurst cup, set for that time, being changed to 10:30 A. M.

East Gloucester Y. C.

Gloucester, Mass.

Wednesday, July 27.

THE East Gloucester Y. C. sailed a club race on July 27 in the evening. The wind was light from the east and there was a heavy fog. The times were:

First Class.

	Elapsed.
Torment, Pomeroy Bros.	1 26 20
Skedaddle, Merchant	1 46 50

Second Class.

Ariel, A. W. Gosbee	1 22 20
Luna, S. D. Hildreth	1 26 56

Third Class.

Doris, J. L. Proctor	1 40 33
Ideal, J. R. Jeffery	1 56 12
Hoodoo, C. McCurdy	Did not Finish.

Kingston Y. C. Special Race.

Kingston, Mass.

Tuesday, July 26.

THE Kingston Y. C. sailed a special race for the 15ft. class on July 26, over a 6-mile course, in a moderate S. W. wind, the times being:

	Elapsed.
Olympia, W. Steele	1 45 53
Veritas, Alex. Holmes	1 49 07
Scrap, A. B. Holmes	1 50 32
Waban, G. W. Schiverick	1 51 38
Kittawake, H. M. Jones	1 53 10
Frolic, J. C. Dawes	1 53 20

Lake Y. R. A. Annual Meet.

Kingston—Lake Ontario.

July 22-26.

THE meet of the Lake Yacht Racing Association at Kingston was a most successful affair, including as it did a combination of really good racing with a jolly social reunion, and an unusual absence of discomforts and annoyances. The port of Kingston is well adapted to the requirements of a meet, the harbor being some six miles long and two wide, completely landlocked and good water everywhere. All starts and finishes were off the house of the Kingston Y. C., the course consisting of two sides of a triangle, each three nautical miles long, the yachts sailing to an outer buoy and back, and then to another buoy and back. This gave the Kingston people a good view of the entire racing from the shore, a point of some importance, as the visiting yachtsmen were under no small obligations to the town's folk. In addition, the course was an excellent one from a racing standpoint, the landlocked surroundings and easily found marks forming an agreeable change from the somewhat prosaic job of hunting up buoys which are difficult to lay and difficult to find in the open lake.

The first three days brought moderate to fresh winds and bright weather, the fourth failing to some extent in the matter of wind, but the races on this occasion were decided on the first round, in accordance with the rules of the Association. It was always possible to start the yachts so as to give windward work to the first buoy, and a run back with a broad reach to the second buoy and a close haul home. This was variety enough to satisfy the most chronic grumbler.

The most prominent feature of the racing was the turnout in the first and 42ft. classes, which sailed together with five starters; of these Vreda, the largest of the lot, was hardly in racing form, but the rest were in excellent shape and sailed to win. Merry Thought, owned this year by Com. Jarvis, is a three-year-old boat built for a cruiser, a roomy craft of 46.31ft. corrected length and large displacement. She had the advantage of the good tuning up and clever handling that Com. Jarvis always gives his boats, and made decidedly close racing with Canada, now commissioned by Geo. H. Gooderham, after a year of retirement, and entered at 44.79ft. racing length under the rule which penalizes her form of midship section. In the first race Merry Thought got the lead at the start and kept it all day, Canada coming up very close at one time, but at the finish Merry Thought had 27s. the advantage over and above her allowance to Canada. Zelma made a good third in each race, Aggie coming in for fourth prize.

The 37ft. class furnished only a couple of duels between Dinah and Viva, the latter winning, although a measurement protest has been entered against the last race. The 32ft. class included only old boats, Norma, Erma and Nox, the latter going up from the class below. Norma won both races, but in the second was disqualified for fouling a buoy.

The 27ft. class saw some hot racing. Last year Kestrel came to Kingston and won, and was promptly bought by Dr. Black, of that place, who went to considerable expense to fit her out this season to compete against Verona, a new Hamilton craft, by the same builders. Verona proved a winner, but the first race sailed in a tame breeze was a neck and neck affair with Kestrel, she being at one time ahead. In the light weather of the second race Verona had a more decided advantage.

In the 22ft. class the Rochester boat Pedro had things all her own way, the entry list being poor. The 22ft. knockabout class showed no new craft built since its establishment, but Veritas, designed by W. P. Stephens, is an excellent example of the type of craft it must produce. In a good breeze she took first place easily the first day, but yielded it to Enid in the lighter weather of the second race.

Aside from the racing, the splendid hospitality of the Kingston Club and the citizens generally made the meet an affair to be remembered for a long time. Special credit is due to Com. Richardson, Secretary Macnee and President Strange, of the L. Y. R. A., for their unremitting attention to the visitors, and as a result everything passed off without a hitch.

The following are the official times of the racing:

July 22.

First Class, 24 Miles—Start 11:00.

	Finish.	Elapsed.	Corrected.
Merry Thought	2 12 10	3 12 10	3 10 05
Canada	2 46 40	3 46 40	3 42 50

Veritas	4 16 20
Euroclydon	7 00 00
Chickadee	Did not finish.

W. Q. PHILLIPS.

The 30-Footers at Newport.

THE 30-footers have raced regularly during the week at Newport, beginning on Monday, as reported last week. In this race Dorothy started ahead of the gun, but did not hear the hail from the committee boat, no recall signal being set. The committee decided that she was disqualified, the prize going to Carolina. On July 26 the Jamestown course was sailed twice in a light south wind, the times being, start 2:53:

	Finish.	Elapsed.
Carolina, P. Jones	5 12 40	2 19 40
Dorothy II., H. P. Whitney	5 14 24	2 21 24
Vaquero III., H. B. Duryea	5 16 44	2 23 44
Veda, C. Vanderbilt, Jr.	5 19 26	2 26 26
Wa Wa, R. Brooks	5 19 40	2 26 40
Hera, R. N. Ellis	Did not finish.	

On the same day the 15-footers sailed a race, Paprika, formerly owned by Sherman Hoyt, starting under the new ownership of J. B. Thomas, Jr. The times were, start 4:04:

	Finish.	Elapsed.
Paprika, J. B. Thomas, Jr.	5 08 20	1 04 20
Taboo, Noyes Brothers	5 12 57	1 08 57
Paradox, E. Dodge	5 15 37	1 11 37
Mariner, J. Conover	5 15 57	1 11 57

On July 27 the fog was so thick that no attempt was made to start the postponed race for the Ellis cup. A sweepstakes race was started, but none of the boats could find the outer mark.

The Ellis cup race was postponed to the following week, and the race of July 29 was a sweepstakes. The course was from Brenton's Cove to Dyer's Island and Jamestown, with a fresh S.W. wind. The times were, start 2:55:

	Finish.	Elapsed.
Hera, R. N. Ellis	5 08 17	2 13 17
Carolina, P. Jones	5 08 47	2 13 47
Wa Wa, R. Brooks	5 10 21	2 15 21
Puck, E. D. Morgan	5 22 25	2 27 25
Veda, C. Vanderbilt, Jr.	5 23 07	2 28 07
Vaquero, H. P. Duryea	Did not finish.	

Vaquero parted a shroud and withdrew.

A race for a cup presented by Mr. H. B. Duryea was scheduled for Saturday, but was postponed, as Messrs. Whitney and Vanderbilt could not be present, a sweepstakes being substituted. The wind was again S.W.; the boats sailed first to the Jamestown mark, then to Dyer's Island and return. The times were, start 2:55:

	Finish.	Elapsed.
Vaquero III., H. B. Duryea	5 09 17	2 14 17
Hera, R. N. Ellis	5 09 50	2 14 50
Puck, E. D. Morgan	5 11 40	2 16 40
Wa Wa, R. Brooks	5 11 57	5 16 57
Carolina, P. Jones	5 13 56	2 18 56

Corinthian Y. C.

Marblehead—Massachusetts Bay.

Saturday, July 30.

THE Corinthian Y. C., of Marblehead, sailed a club race on July 30, in a light and variable breeze, followed by a heavy squall. The times were:

Indian Harbor Y. C.

Greenwich—Long Island Sound.

Saturday, July 30.

THE Indian Harbor Y. C. made all necessary arrangements for a good race on July 30, its annual regatta, but the weather was most unsatisfactory, in the morning a calm, with a hot stifling atmosphere, and during the race a severe squall, which capsized the centerboard catboats Volsung and Punch.

The preparatory signal was given at 1:30, the wind being very light, with indications of a thunderstorm which were more than realized during the second round. The first round was timed:

Tern, 2:26:23; Black Cat, 2:26:28; Ketch II., 2:26:36; Tyler's unnamed, 2:30:20; Kit, 2:36:28; Akabo, 2:38:02; Volsung, 2:39:23; Wanda, 2:39:34; Dosoris II., 2:39:58; Asthore, 2:40:48; Acushla, 2:41:06; Anoatok, 2:41:33; Dragon, 2:41:42; Qui Vive, 2:43:28; Vorant II., 2:45:42; Montauk, 2:48:42; Mongoose, 2:58:07; Sirene, 2:58:55; Lucille, 2:58:30; Indianola, 2:59:03; Spray, 3:12:53; Minnetonka, 3:16:29, and Gosbird, 3:31:52.

Volsung goosewinged in the squall and capsized; Wanda, an easy leader in the class below, abandoning the race to aid her. When Punch capsized, Akabo and Minnetonka went to her aid with Mr. Muller's launch Wolverine. The two young tars on Minnetonka, in spite of much lost time, finally finished and won in their class; Akabo also won. The times were:

Cabin Sloops, 36ft. Class—Start 1:35.

	R. M.	Elapsed.	Corrected.

Madge, George D. O'Brien	Withdrew.	
Elizabeth, Charles Babbage	Withdrew.	
Edelweiss, J. T. Ball	Withdrew.	

Royal St. Lawrence Y. C.

Dorval—Lake St. Louis.

Saturday, July 30.

THE second series of trials of the Royal St. Lawrence Y. C. was sailed on July 30 in variable winds, moderate to a calm. Only three boats started, as crews could not be made up for Glencairn and Strathcona. The times were:

	1st leg.	2d leg.	Finish.	Elapsed.
Manitou	4 08 35	4 14 15	4 22 00	0 30 50
Duggan	4 10 40	4 14 35	4 22 15	0 30 35
Speculator	4 14 10	4 18 45	4 26 15	0 34 25
	1st leg.	2d leg.	Finish.	Elapsed.

Speculator	4 55 54	5 01 20	5 10 50	0 34 25
Manitou	4 56 35	5 01 55	5 11 33	0 33 15
	1st leg.	2d leg.	Finish.	Elapsed.
Duggan	5 35 20	5 41 00	5 51 10	0 31 55
Speculator	5 35 50	5 41 41	5 52 05	0 33 05
Manitou	5 37 00	5 43 10	5 54 15	0 35 10

Com. Jarvis, R. C. Y. C., has been invited to sail one boat in the trial races, but declined, owing to pressure of business.

Burgess Y. C. Open Race.

Marblehead—Massachusetts Bay.

Saturday, July 30.

THE Burgess Y. C. attempted to sail its annual open regatta on July 30, in a light breeze followed by a heavy thunder squall. The 18-footer Duchess capsized while running off under jib alone, her crew being taken off by the Eastern Y. C. committee boat. The yacht was afterward brought into Marblehead Harbor by her crew, with her bowsprit broken. All the other starters gave up.

Rifle Range and Gallery.

The Revolver.

THE revolver, in its present form, is not the result of the invention of any one man, although Col. Colt was the first to make it a practical weapon; but rather the result of a long series of evolutions from the old single-barrel pistol.

When the pistol was first made it was soon found that there was need of a way to fire several shots in rapid succession, long before such a pressing need was felt in the rifle.

The pistol is only used, as a rule, at close quarters; so if the first shot is a miss there is no time to reload to take another shot.

Double-barreled pistols and then three, four or more barreled ones were in consequence made, but in the early stages these barrels were all made of the full length of the pistol, and each barrel loaded as a separate pistol.

The double-barreled ones had a lock for each barrel, the three-barreled ones were often made with the barrels one below the other (the double barrels being either horizontal, or more rarely vertical to each other).

When more than three barrels were used, they were generally grouped in a cluster round a solid core, never, or hardly ever, with a center barrel surrounded by others, as this would present a mechanical difficulty in firing the center one.

I remember, some years ago, seeing a French pin fire revolver which fired twelve shots. The chambers in the cylinder seemed in a double tier, with two barrels, one for the inner circle and the other for the outer circle, but I did not have a chance to examine it closely as to the construction.

In order to fire the various barrels of the pistol, one of the earliest forms had a firing pin, which was put opposite the cap of each barrel in succession (this was not possible in the wheel and flint lock days). Another form was to have the hammer come opposite each barrel in turn, first moved by hand, and later by mechanism, automatically; this form was used in flint locks, and is retained in some modern pistols and multi-barreled rifles.

The first actual revolver had the barrels revolve so as to come opposite the hammer in turn. This was found mechanically weak, so the revolving cylinder with chambers coming opposite a barrel common to all in turn was evolved, and this, with modifications, is the form of all modern revolvers.

The reason the original idea of a set of barrels was abandoned for a cylinder with chambers opening on to a barrel common to all is the following:

At the first glance it would be thought that the former plan is the best. A barrel complete in itself shoots not only harder (owing to there being no escape of gas, such as unavoidably takes place between the barrel and cylinder of the latter plan), but more accurately (as there is no joint between the cylinder and barrel). Nevertheless the cylinder revolver is not only lighter, owing to there being only one barrel instead of several, each the whole length of the pistol, but it can shoot much more accurately. At the same time, each barrel of the "pepper box," as the old revolving barrel pistol was called, shot individually better and more accurately.

The reason of this seeming paradox is as follows:

Any one who has shot or regulated a double-barreled rifle knows how difficult it is to get the two barrels to shoot parallel, both horizontally and vertically, to each other; each barrel may shoot perfectly in itself, but when joined together one barrel will be found to shoot higher than the other, or they will shoot across or away from each other. Fixing the two barrels mechanically parallel to each other is no use, as, there being no more resistance to the recoil where the barrels touch each other, they shoot away from each other (or apart), and they can only be regulated by hand at great expense and trouble. If this difficulty is found in double barrels, it is infinitely increased as the number of barrels is increased. In fact I do not think any amount of regulating can make four or more barrels shoot together.

For this reason the revolving cylinder has been almost universally adopted, in spite of the varying escape of gas inevitable, and of the fact that the chamber occasionally does not come opposite the barrel, owing to fouling or dirt getting into the action. If there is an extra escape of gas at a shot, it makes that shot weaker, and consequently low, and if the chamber does not quite come round far enough, a shaving is taken off a side of the bullet, causing irregular flight and an inaccurate shot. In my opinion the revolver of the future will have an arrangement for making the connection between the chamber and barrel gas tight during each shot, so as to make it as accurate as a single-barrel pistol. The cocking arrangement also needs improvement. It has either to be cocked by hand, causing loss of time, and what is more important, loss of aim; or it is cocked by the trigger, which latter plan, though more rapid, gains rapidity by loss of accuracy, as it is impossible to "hold" on to the object and at the same time lift the hammer by the trigger. There ought to be some way of the revolver cocking itself by the discharge; this cocking only to take place when wanted.

A revolver with these two improvements would be, in my opinion, superior to any repeating pistol, as it would balance properly, which no repeating pistol I have seen does, and would be of much more compact shape. Also the stock should be more in line with the barrel (like the duelling pistol), instead of below it, as so many revolvers are made, especially those of the "bull dog" pattern.

The way revolver shooting is practiced in the Western States of America is the only real way to learn to shoot a revolver. In this country revolver shooting is practiced as a sort of game, like croquet, tennis or golf.

I personally do not think the deliberate sort of shooting of much use. The only useful practice is rapid shooting and a moving series of competitions, as a revolver is only used for war or self-defense at extremely short range and in very rapid firing.

There are many enthusiasts who make good scores at small stationary bull's eyes, and are constantly improving at that sort of skill, who could not hit even the outer edge of the target if called on to take a snap shot from either on foot or horseback.

In all shooting competitions, as in fact in all competitions which were originally intended to be practiced for some useful purpose, there is a constant and seemingly inevitable tendency to drift into unpractical lines, and a development in just that direction which is useless for all practical purposes.

In racing it gets into breeding racing "machines" which cannot carry a child's weight; in pigeon shooting, clay bird shooting, and rifle shooting, it only teaches a knack for those particular sports, which is of no use in the field. In the same way revolver shooting at stationary targets spoils a man's handling of a revolver.

If I had to train a man to shoot a revolver for practical use, I would rather take one with good eyesight and a steady hand, who had never fired a revolver before, than some of our crack revolver prize winners. The former may learn to shoot properly; the latter never. I consider the Series 3 (rapid firing, six shots in twelve seconds), which the National Rifle Association have adopted at my suggestion, a very practical revolver competition, but unfortunately very few men enter for it, preferring the stationary targets.

As revolver shooting clubs have to study the likes and dislikes of their patrons, it seems inevitable that revolver shooting will have to continue on the same old unpractical lines of deliberate shooting at stationary targets.—Walter Winans in Encyclopædia of Sports.

The National Schuetzenfest.

SINCE the competition in the National Schuetzenfest was concluded, now nearly a month ago, FOREST AND STREAM has been endeavoring to obtain the official scores. In the first week we were informed by the secretary the scores were being prepared by him and his assistant, and the former assured the representative of FOREST AND STREAM that the scores published by the daily press and such weekly papers as published them were entirely erroneous and unreliable. The second week the plea then was that the assistant was incompetent, and had made many errors; that some scores were entirely missing, and that therefore the president of the Association had issued strict orders not to give out any scores till further orders. Still, each time the secretary, Mr. Roedel, faithfully promised that FOREST AND STREAM would have the scores the following week, and that finally they would certainly be forthcoming last Saturday. Calling then as per appointment, the secretary curtly informed the representative of FOREST AND STREAM as follows: "I cannot let you have them. It is against my orders." Then turned his back and resumed work on the scores, as he had been working on them betimes for weeks, with indefinite prospect of ever ending.

The hundreds of riflemen who participated in the Schuetzenfest have a keen interest in all that truthfully pertains to that competition; also the public at large would have been pleased to have the correct scores both for perusal and reference; but all this counts for nothing against the official pomposity and self-importance of a president who inferentially considers that the office was specially created for him to air his whims and exalt his vanities therein, to which the calm procrastination of the secretary is ably supplemented.

This will explain why the correct scores have not appeared in our columns. We have the assurance of the secretary that no correct scores have been published. So masterful have been the officers of the Schuetzenbund in inaction and egotistical secrecy concerning the scores that they now have ceased to be a matter of interest as a news feature.

Cincinnati Rifle Association.

THE following scores were made by members of the Cincinnati Rifle Association, at their range, July 24. Conditions 200yds., any rifle, at the German ring target. Gindele was declared high cockalorum with a score of 212 on the king target. Nestler was high on the honor target with a score of 63. Payne's 223 was high for the Uckotter trophy. Weather very warm, and a tricky wind prevailed. Payne shot King's semi-smokeless:

King target:

Gindele	22	18	22	21	19	22	20	23	24	21	—212
Weinheimer	23	22	16	19	10	15	22	18	7	17	—169

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Aug. 3-4.—Worcester, Mass.—Tournament of the Worcester Sportsmen's Club. Targets.

Aug. 4-6.—Baltimore, Md.—Ocean City midsummer tournament; two days at targets; last day at live birds. James R. Malone, Manager.

Aug. 9.—Hobart, Ind.—All-day shoot of the Hobart Gun Club. C. M. Townsend, Sec'y.

Aug. 10-11.—Sherburne, N. Y.—Two days' shoot of Sherburne Gun Club, at targets. L. D. Branard, Sec'y.

Aug. 10-11.—Duluth, Minn.—Central Gun Club's sixth annual tournament; targets. E. C. Maxfield, Sec'y.

Aug. 11.—Marlborough, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Marlborough Gun Club. J. B. Rogers, Manager.

Aug. 13.—Bound Brook, N. J.—Central New Jersey League shoot. Mr. U. G. Tingley, Sec'y.

Aug. 17-18.—Waterville, Me.—Tournament of the Interstate Association, under the auspices of the Waterville Gun Club. E. T. Wyman, Sec'y.

Aug. 17-18.—Warsaw, Ind.—Lake City Gun Club's tournament. J. S. Campfield, Sec'y.

Aug. 17-18.—Canton, Ill.—Nineteenth annual tournament of the Canton Gun Club. J. C. Thompson, Jr., Sec'y.

Aug. 23-26.—Detroit, Mich.—Tournament of Michigan Trap-Shooters' League. W. H. Brady, Sec'y.

Aug. 24.—Warwick, N. Y.—Special shoot, Hudson River Trap-Shooters' League, on grounds of Warwick Gun Club. J. B. Rogers, Manager.

Aug. 24-25.—Minneapolis, Minn.—Tournament of the Minneapolis Gun Club. G. J. McGraw, Sec'y.

Sept. 5.—Meriden, Conn.—Fourth annual Labor Day tournament of the Parker Gun Club. C. S. Howard, Sec'y.

Sept. 5-6.—Reading, Pa.—Mt. Penn Gun Club's merchandise and intercounty trophy shoot; targets.

Sept. 6-8.—St. Paul, Minn.—St. Paul Gun Club's twenty-first annual tournament at Minnesota State Fair grounds during fair week. H. C. Lawrence, Sec'y.

Sept. 6-9.—Kansas City, Mo.—Schmelzer Arms Co.'s fifth annual tournament; targets and live birds.

Sept. 7-8.—Kingston, N. Y.—Tournament of Hudson River League, on grounds of Kingston Gun Club.

Sept. 7-8.—Haverhill, Mass.—Tournament of the Interstate Association, under the auspices of the Haverhill Gun Club. Geo. F. Stevens, Sec'y.

Sept. 7-8.—Sidell, Ill.—Sidell Gun Club's tournament; targets only. H. J. Sconce, Manager.

Sept. 21-22.—Cleveland, O.—Cleveland Gun Club's eighteenth annual tournament. J. R. Donnelly, Sec'y.

Oct. 4-6.—Newburgh, N. Y.—West Newburgh Gun and Rifle Association's fall tournament.

Oct. 12-13.—Greensburgh, Ind.—Greensburgh Gun Club's tournament. W. Woodfill, Sec'y.

Oct. 18-20.—Nashville, Tenn.—At Belle Meade Stock Farm; $500 added.

Oct. 18-21.—Belle Meade Stock Farm, near Nashville, Tenn.—Two days at targets; two days at live birds; $500 added.

Postponed.

—— —.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

1899.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

Miss Annie Oakley grows in popular favor each year. This season she has added some new features to her Wild West exhibitions of skill with the shotgun. Buffalo Bill's Wild West arrived in Chicago recently, and in a column notice of that event the following was devoted to Miss Oakley: "Annie Oakley is especially interesting this year. She wears a jaunty doll skirt habit of military blue, trimmed with silver braid and lined with white pique, from under which flutters the most fascinating assortment of lingerie, which might fill with envy the top tray of a ballet girl. Annie's aim is unerring, and she has some saucy antics added to her soubrette part of the gunning which are mischievous and attractive. Aside from her usual feature of the show, Miss Oakley does a charming bit of haut ecole, riding upon a spirited brown broncho, which dances and bows and maneuvers prettily and dangerously, with Annie holding the whip and spur over him in a most learned way. She wears a dark blue costume, long as the plainswomen ever wear them, and she is accompanied by a bevy of rancheras, who sit in the saddle as comfortably as home-made ladies do in a rocking chair. Annie bethought herself of a ride in the procession yesterday, and for her courtesy received a drenching from her vaquero hat to her pearl-buttoned leggings, but it did not worry her any except to 'muss up' her tent."

Mr. Thomas P. Hicks has annexed the Chicago challenge trophy to his possessions until such time as it may be captured by some other shooter—not an easy proposition by any means. Mr. Hicks is a good class shooter, and is likely to give any contestant a warm competition for it at any time. In the contest for it last Saturday Mr. Hicks won it, defeating Mr. A. C. Paterson, who has heretofore held it against all comers since it became a matter of contest. Patti shot at 25, standing at 30yds., and missed one bird. Hicks shot at 27, also standing at 30yds., though he was allowed a yard less by the committee. Patti shot his other matches well, but he was also lucky in being sometimes against very weak competitors. It is better for the prestige of the trophy that it remain longer in competition, and have more association with well-contested friendly struggles for its permanent possession, and such there now will be before it is taken from Mr. Hicks, who is able to give a competition worthy to be sought, as has Mr. Paterson given.

On Friday, Sept. 9, the day following the Interstate Association's tournament at Haverhill, Mass., O. R. Dickey, manager of the Boston Shooting Association, with grounds at Wellington, Mass., just outside Boston, will give an all-day shoot, assisted by Elmer E. Shaner, of the Interstate Association. At this shoot Mr. Dickey proposes to have a popular programme, comprising about four 15-target events and two 20-target events, with four 25-target events interspersed. The four 25-target events will constitute a 100-target event, the main prize in which will be a cup to the winner. Each 25 targets will be a separate event, with a fixed entry fee, or with an optional sweep attached to it. Mr. Dickey's shoots are always well managed, and as everybody can always get plenty of shooting and plenty to eat at the Wellington grounds, this tournament, coming as it does right on the heels of the Haverhill shoot, ought to be well attended. The programme will be out shortly, and anyone can get a copy by addressing Mr. Dickey, Wellington, Mass.

The term "added money" is many times a misnomer as used in trap-shooting events. When the shooters are taxed a higher price for targets in order that the "added money" may be forthcoming it is money then which simply is guaranteed. Money so raised comes mostly from the weaker shooters, the ones who are in the third or fourth places in the money, or who do not win at all. It is a tax on them in the interest of the good shots, and a tax from which they receive no benefit whatever. Besides the sweepstake moneys, it is an additional amount set apart for the good shots.

Little Rock, Ark., was again fixed upon as the place for the next Arkansas State tournament.

The programme of the Interstate Association's trap-shooting tournament, given for the Waterville Gun Club, Waterville, Me., Aug. 17 and 18, is now ready for distribution, and can be obtained of Mr. E. T. Wyman, secretary W. G. C., Waterville, Me., or of Mr. Elmer E. Shaner, 122 Diamond Market, Pittsburg, Pa. There are ten events provided for each day, seven of which are at 15 bluerocks, three at 20, and to each of the latter there is $500 added money. Shooting commences at 9 o'clock each day. The headquarters during the tournament will be at the Elmwood Hotel. Electric cars leaving the hotel every half-hour take the shooter within five minutes' walk of the grounds. Guns and ammunition sent to Secretary Wyman will be delivered at the shooting grounds free of expense. Reduced rates will be given over the Maine Central R. R. All purses will be divided according to the Rose system at the ratio of 4, 3, 2, 1.

The Chicago Chronicle, in its account of the Hicks-Paterson debate over the challenge trophy, sapiently says: "The terms of the shoot were arranged on a 12-gauge basis, and as Hicks shot a 10-gauge he was assigned a handicap of 2 birds, with a 29yds. rise, while Paterson shot at 25 birds, with a 30yds. rise." This solves the long-sought-for principle of a just and universal handicap. Still, following the principles of this handicap still further, if Hicks had used a 4-bore he would have been placed at 25yds., and would have had 6 more birds to shoot at, while on the other hand if Patti had shot a 16 or 20-gauge, the handicap would have settled the matter to a nicety. When the giant brain of the daily press reporter swings on its pivot to focus on matters of gun or dog, something unique is sure to be produced.

Mr. John J. Fleming, captain of the Forester Gun Club, of Newark, N. J., writes us as follows: "The Forester Gun Club, of this city, are making arrangements for an all-day handicap merchandise shoot on Saturday, Sept. 5, the shoot to begin at 10 A. M. sharp. In our merchandise event, first prize will be a trap gun, 50 targets, known angles, rapid fire system. Another event, called the Gold Dust, 25 targets, known angles, optional—sweepstakes throughout. In the other events professionals are barred from taking part in prize or sweepstakes. Targets 1 cent. Lunch and shells can be had on the grounds."

On Saturday of this week, at Elkwood Park, Long Branch, N. J., the Elkwood Futurity will be shot. The conditions are 50 birds, $50 entrance, cup and 40 per cent. to the winner; 25 to 33yds. handicap. The conditions will be changed to 25 birds, $25 entrance, if no objections are raised. On Aug. 10 the Daly cup will be shot for; all stand at 30yds., 15 birds, $15 entrance, cup and 40 per cent. to the winner.

Next week the Hobart Gun Club holds a shoot on Tuesday. On Wednesday and Thursday the Sherburne Gun Club, Sherburne, N. Y., holds a shoot; also the Central Gun Club, of Duluth, Minn. On Thursday the Hudson River Trap-Shooters' League holds a trophy shoot on the grounds of the Marlborough Gun Club, Marlborough, N. Y.

The match fixed for Aug. 2, at Pittsburg, with the peculiar conditions that each contestant was to shoot at 500 targets in one afternoon, Messrs. Elmer E. Shaner and John Knode on the one side against Bessemer and W. S. King on the other, has been declared off.

The Michigan Trap-Shooters' League have decided to hold a grand tournament at Detroit, Mich., Aug. 23 to 26, inclusive. The policy of the managers is to bring out the amateur shooter and to encourage the poorer shots to engage in the sport.

This week the Worcester Sportsmen's Club, Worcester, Mass., holds a tournament on targets, on Wednesday and Thursday. On Thursday, Friday and Saturday the midsummer tournament takes place at Ocean City, Md.; two days at targets; one at live birds.

On July 27 Messrs. Huck and Wright shot off their tie of July 12 in the E. C. cup event, and tied again on 22. In the main event for the E. C. cup the scores were as follows: Wright 24, Huck 21, Paul 22, Frank 20, Jersey 6.

Keep in mind the Brooklyn Gun Club shoot, Aug. 13. John Wright has been seen to be in numerous brown studies of late, and when he is so occupied he is elaborating shooting surprises.

The Parker Gun Club will hold its fourth annual Labor Day tournament on Sept. 5, on its grounds at Hanover Park. All communications addressed to Mr. C. S. Howard, the club secretary, will receive prompt attention.

Mr. J. C. Thompson, Jr., secretary of the Canton Gun Club, Canton, Ill., informs us that his club will hold its nineteenth annual tournament on Aug. 17 and 18.

See Litzke's report of Arkansas State shoot for important changes and amendment to Arkansas game laws.

The match between Messrs. Gilbert and Heikes for the E. C. cup will be shot at Watson's Park, Aug. 13.

The Boiling Springs Gun Club, Rutherford, N. J., will hold its regular monthly shoot on Saturday of this week.

Arkansas State Tournament.

LITTLE ROCK, Ark., July 29.—The attendance at the eighth annual tournament of the Arkansas State Sportsmen's Association was by no means up to the magnitude which one would expect at a tournament with such a liberal amount of added money, which had been so judiciously distributed throughout the entire programme. Another thing which would lead one to expect a good attendance at this tournament is that the added money by far exceeded that hung up at any shoot in this section during the present spring and summer. However, it must not be inferred from this that it was not a success, for such was by no means the case. The light attendance in no way interfered with the carrying out of the programme. Everything was carried out to the letter. The visiting shooters expressed themselves as highly elated over the manner in which everything was conducted, and further stated that it was their intention to return again next year, when the ninth annual shoot is held, so that in all probability the attendance will be much larger. One thing is certain, that since our war with Spain began the trap-shooting interest has suffered considerably here in the South, and it is possible that the lack of attendance was due in some measure to it, though I know of very few trap-shooters who have joined the army.

DIVISIONS OF MONEY.

The money at this tournament was divided by the Rose system, four moneys in the 15-bird events, five in the 20-bird event. The ratio was 7, 5, 4 and 3 when there were four moneys, and 7, 5, 4, 3 and 2 when there were five divisions. This of course did away with the lucky hole that some people like to harp on, but at the same time it enabled those to stay in the competition who certainly would have been forced out by the old percentage system. As it was, it seldom occurred that when one shot into money he failed to draw out more than his entrance, even though he only got fourth place. The added money of course made this possible. This always exceeds the price of the targets.

VISITING SPORTSMEN.

There were present W. A. Leach, F. B. Baptist, Joe P. Matthews and J. A. Webber, of Fort Smith; Dr. S. P. Collings, Dr. A. U. Williams (Dobbins), C. N. Rix and John J. Sumpter, Jr., Hot Springs; W. H. Langford, E. C. Arnold, J. A. Coles, E. A. Howell, Geo. W. Clements, Dr. H. E. Williams and J. T. Lloyd, Pine Bluff; Jeff Davis, Russelville. These were the visiting State shooters. Then there were J. A. Jackson, Austin, Tex.; F. Brady, Waxahachie Tex.; Dr. A. A. Forsythe, Monroe, La.; E. M. Lindsey and J. T. Welch, Robeline, La.; Frank P. Poston (Parks), Memphis, Tenn.; Andy Meaders, Nashville, Tenn.; and Herbert Taylor, St. Louis, Mo., the only trade representative, of the Du Pont and Hazard powder companies.

ANNUAL MEETING.

The Association met in annual convention Tuesday night, in the council chamber of the City Hall, President Langford presiding. This was one of the most enthusiastic and best attended meetings the Association has ever had. The most important business transacted was the adoption of a suitable game law to present to the Legislature next winter. Mr. John M. Rose, chairman of the game law committee, had drawn up a good bill, which after some slight amendment as to the open and close seasons was adopted. The principal feature in this bill consists in the absolute prohibition of the shipment of game out of the State, though the sportsman may carry the same out with him. The open season on deer is to be from Sept. 1 to Jan. 1; turkeys, Oct. 1 to May 1; quail, Nov. 1 to March 1. Prairie chickens are to be protected for five years, after which the open season is to be Sept. 1 to Dec. 1. Doves, Aug. 1 to March 1; ducks, Sept. 1 to March 1. Mongolian and English pheasants are to be protected for ten years. Trapping of any game or song bird is also prohibited. Efforts will also be made to create the office of game warden, though according to the constitution of the State such is unconstitutional, as it specifies that the Legislature shall create no new offices unless by a constitutional amendment. Messrs. John M. Rose and Paul R. Litzke were appointed a committee to put the bill in proper shape to present to the Legislature.

Mr. John M. Rose was authorized to have 2,000 copies of the game law printed, and also publish in connection therewith the new law protecting song birds. Mr. Rose stated that he could readily have them distributed and posted up in all parts of the State.

Little Rock was again selected as a meeting point for next year, and the following officers were unanimously elected: W. R. Duley, President; J. K. Thibault, Vice-President; E. T. Reaves, Treasurer; and Paul R. Litzke, Secretary.

FIRST DAY, TUESDAY, JULY 26.

The shooting done by the principals to-day is of a very high order for amateur shooters at least. While the pace cut out by some of the contestants would be considered creditable performance for even the professional class. Dr. Forsythe is at the top of the heap with .925, closely followed by Matthews and Jackson, with Sumpter next. Then comes Thibault, Pemberton, Coles, Dickinson and Taylor in a bunch, all of whom have .881.

Thibault made the best run of the day, 53 straight; he began this in the eighth event, where he scored his last 12 straight, and then continued until he lost his 12th in the first extra, which was shot after the programme was concluded.

The weather was cloudy, but pleasant, and there was very little wind to interfere with the flight of the birds. Only twenty-nine shooters participated, though of this number twenty-four shot the entire programme.

Nos. 4 and 8 were 20-bird events, while the others were 15s. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Shot at.	Broke.	Av.
Forsythe	14	13	14	19	14	15	15	17	13	14	160	148	.925
Matthews	12	14	14	17	14	14	13	19	14	14	160	146	.913
Jackson	14	15	14	18	12	13	15	20	12	13	160	146	.913
Sumpter	13	14	12	19	14	13	14	15	14	15	160	143	.893
Thibault	15	12	13	18	14	11	13	15	15	15	160	141	.881
Pemberton	13	15	14	18	13	14	13	17	13	11	160	141	.881
Coles	12	13	13	17	15	12	14	16	15	14	160	141	.881
Dickinson	13	12	13	19	13	14	12	19	14	12	160	141	.881
Taylor	11	15	13	19	14	15	12	15	13	14	160	141	.881
Brady	14	14	14	18	12	12	14	16	14	12	160	140	.875
Welch	15	11	9	20	13	14	13	20	11	13	160	139	.868
Woodson	14	14	14	16	13	13	14	19	11	11	160	139	.868
Clements	14	13	12	18	11	12	14	18	12	13	160	137	.856
Howell	13	13	14	18	8	12	13	19	13	14	160	137	.856

SECOND DAY, WEDNESDAY, JULY 27.

The conditions were similar in many respects to those of yesterday. There was a good wind blowing, and as a result the averages are not near so high, though quite a number of contestants did fine work. Sumpter and Forsythe were high. Jackson was third, and Coles and Matthews tied for fourth and fifth places. There were no long runs made, and misses occurred entirely too frequently for the shooters. Andy Meaders, of Nashville, Tenn.; Dr. A. U. Williams and C. N. Rix, of Hot Springs, and W. H. Langford, of Pine Bluff, were new arrivals. These brought the number of participants up to thirty, of which twenty-two shot through. In addition to the ten regular events the four-men team championship was decided. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	Shot at.	Broke.	Av.
Sumpter	13	14	14	19	11	15	13	17	14	12	160	142	.887

AVERAGE MONEY.

Fifty dollars average money went to the seven high guns, being divided $10, $9, $8, $7, $6, $5 and $5. Jackson won first, Forsythe second, Coles third, Matthews fourth, Sumpter fifth, Clements sixth and Taylor seventh. Taylor would not accept the $5 he was entitled to, but donated it to the Association. This was a gracious act on his part, and will be duly appreciated by all the members. The race for general average was also a hot one, and it was by virtue of good shooting on the part of Jackson and Coles that the former was able to win first and the latter came from sixth to third and led all the other State shooters. It will be seen that seventeen shot through the entire three days' programme, which is a very creditable showing for the number of shooters who participated in the tournament.

GENERAL AVERAGES

	1st Day.	2d Day.	3d Day.	Shot at.	Broke.	Av.
Jackson	146	139	142	480	427	.889
Forsythe	148	142	133	480	423	.881
Coles	141	138	142	480	421	.877
Matthews	146	138	131	480	415	.864
Sumpter	143	142	128	480	413	.860
Clements	137	137	130	480	404	.845
Taylor	141	130	127	480	398	.829
Dickinson	141	124	130	480	395	.823
Welch	139	132	122	480	393	.818
Pemberton	141	124	126	480	391	.814
Collings	136	130	121	480	387	.806
Woodson	139	126	122	480	387	.806
Howell	137	125	125	480	387	.806
Lindsey	130	123	131	480	384	.800
Thibault	141	119	116	480	376	.783
Duley	131	116	117	480	374	.779
Baptist	105	104	94	480	303	.631

THIRD DAY, JULY 28.

Down here in the South a good breeze is always welcome, especially in the summer time, but the one that prevailed here today bordered too much on a gale to suit the shooters who were participating in the tournament. The fits and squalls with which this wind did business was responsible for so many ragged scores, so that the shooting was really better than it looks in type. Coles and Jackson did the most consistent shooting, and tied for first honors, but there is a wide gap between these and Dr. Forsythe, who is third. Dobbins was fourth. The entries fell off some, so that but twenty-five participated, while twenty-one shot through. J. T. Lloyd and Dr. H. E. Williams, of Pine Bluff, are the new faces on hand to-day.

The feature of the day was the individual State championship race.

INDIVIDUAL STATE CHAMPIONSHIP.

In many respects this was a most spirited contest, for when it looked irretrievably lost to Sumpter he came to the front in great shape and won out by the narrow margin of one bird. In the first string of 25 he scored but 18, while Coles fininshed with 22. Such other good shots as Matthews and Dickinson each had 21. However, in his last string of 25 Sumpter did some great shooting, scoring 24 and finishing with a total of 42, which in the gale of wind was equal to 47 on a calm day. It appeared certain that Dickinson would tie him, but he lost his last bird, a little easy straightaway, which put him out with a total of 41, one bird shy. Clements also scored 41, while Woodson and Matthews got 40. Taylor and Dickinson shot another string of 50 for practice to fill up a squad, and on this occasion each of these scored 43, but as Dickinson's score did not count, and Taylor is not a member of the Association—not being a resident of the State—these scores went for naught, and Sumpter again takes possession of the medal, which the Association relieved him of for the brief period of two days by redeeming it. This trophy is subject to challenge, and it is now to be seen whether any one will try conclusions with John. It remained in his possession since January, when he won it from Clements without anybody troubling him for it. Matthews would like to give Sumpter a game, but he wants him to come to Fort Smith to shoot the race, which John naturally declines to do.

The conditions of this event are 50 singles, unknown angles, entrance price of targets. The upper row of 25 was shot last. The scores:

Sumpter	1111111111111111011111111 –24	
	11101110110111101110000111–18—42	
Dickinson	0101101111101111111111110—20	
	0111111110111011111101111—21—41

TEAM CHAMPIONSHIP.

Three cities were represented by teams of four men in this event, which was won by Little Rock on the poorest score ever made in the history of the Association. For some reason or other the shooting in this event was very erratic. Only two shooters on the winning team and one each on the other teams shot anywhere near their true form. This is the second time that Little Rock has won the trophy. Pine Bluff won it last year, but owing to circumstances that could not be overcome they were unable to enter a team this year, though they had three men present.

The conditions of the race are four men to a team, 25 singles per man, unknown angles, entrance $10 per team:

Little Rock Team.

Dickinson	1110111101101111101111111 –21	
Duley	1111111101101111011111111 –21	
Thibault	1110111110100111001011111—18	
Woodson	1010001110111101101011111—17 –77	

Hot Springs Team.

Steurer	0111111110—8	Lembeck	1111111110—9
Hieber	1101001110—6		

No. 2, miss-and-out:

Dodds	0	Vreeland	0
Collins	110	Knobloch	1110
Erhardt	110	Agneau	110
Steurer	1111	Lembeck	10
Hieber	1110		

W. C. COLLINS, Sec'y.

The Meriden Interstate Tournament.

THE sixth on the list of Interstate tournaments for this year was given for the Parker Gun Club, at Meriden, Conn., July 27 and 28. The event was a success far beyond the highest anticipations of those present, and ranked well as a large tournament, as a list of the competitors, given herewith, will show. They also were persistent contestants, many shooting through the programme. No one made any very large winning, as is commonly the case when so many shooters are nearly alike as to class.

The club grounds are close by Hanover Park, in a beautiful setting of hills and vales and woods, a few minutes' ride from the hotels where the shooters were quartered. Through a most pleasing landscape to look upon, the varying colors, and depth and absence of shadows, made the shooting somewhat difficult on that account, which was somewhat added to by the dull light. The traps too were irregular in their good working.

As to the management, it was as near perfection as is necessary. Squad followed squad with such promptness and regularity that as one squad finished shooting and dropped out man by man, the next squad swung into place, and the call of pull and lost or broke went on uninterruptedly. As the last squad of an event finished, No. 1 squad of the next was all ready to begin, and so it went on smoothly to the end. Before the shoot, Mr. Shaner made a brief but pointed speech, informing the shooters that the blackboard had the official score; that any objection in respect to alleged errors must be made promptly, and that the referee's decision was final. It is specially worthy of note that the shoot was concluded without a claim of an error being raised by any shooter. The tournament was admirably organized as a whole, and each man in his special department conducted it skillfully. Mr. Elmer E. Shaner, manager of the Interstate Association, had control of affairs. Mr. C. S. Howard, secretary of the Parker Gun Club, was cashier, assisted by Mr. F. Stevenson, Jr., while Mr. L. C. Parker attended to the clerical work. Mr. Marshall Butler attended to the manifolding; Mr. D. F. Power officiated at the blackboard. Mr. J. M. Taylor refereed, assisted by Mr. L. J. Gaines. The trap pulling was admirably done by Mr. Samuel Tyler. Mr. Gaines was also chairman of the executive committee.

There were ten events on the programme for each of the two days, though the tenth event of the first day was carried over till the second day, and was shot off on Thursday morning.

The programme for each day was alike, namely, six 15-target events and four 20-target events, entrance $1.50 and $2 respectively. There was $100 added by the Parker Gun Club, and a prize cup, value $50, for competition by the paid representatives, making the highest score, shooting the entire programme both days. At the end of the first day Messrs. Tucker and Fanning were 3 targets apart, the former having missed 9, the latter 6, with no one dangerously near, so that their competition on the second day was watched with the greatest interest. It was very close indeed, both shooting well in a manner, yet always very close together, so that the final result was in doubt almost to the end, Fanning winning the cup on the very narrow margin of 1 target.

The price of the targets was 3 cents—too high, it seems to us, on any basis of equity. Each manufacturers' agent who shot through the programme of 340 targets thus was charged $10.20, quite a sum in the aggregate paid by all the agents, and with no possible return other that the competition for the cup. As the 340 targets could be easily thrown at 1 cent without loss, this left a profit of $6.80 contributed by each agent, too much of an exaction. At the Interstate tournament at Macon the barred experts were charged 2 cents per target; at Brunswick, 2 cents the first day, 1 cent the second day; at Meadville, 1 cent throughout. It might be assumed that the large number of representatives present was proof that they liked 3-cent targets, but they did not. The popularity of the event and its promoters was the cause, not the 3-cent targets.

The averages of those who shot through the programme of both days is as follows: Fanning .953, Tucker .950, Tallman .910, Banks .900, Wheeler .897, Fulford .891, Jordan .891, Dickey .890, Parker .888, Keller .868, Money .851, Courtney .804, Norton .656.

In events Nos. 1, 2, 4, 6 and 7 each day $10 was added to the purse. Nos. 1, 3, 5, 7 and 9 of the first day were known angles; Nos. 2, 4, 6, 8 and 10 of the second day were known angles; others, unknown.

MANUFACTURERS' AGENTS AND OTHERS.

The barred class was strongly represented, no less than eighteen being on the ground, while seventeen of the eighteen competed in the events, paying 3 cents apiece for each of their targets like little men. Among the number were: Capt. A. W. Money and Edward Banks, of The American E. C. & Schultze Powder Co.; Tom Keller, King Powder Co.; Ed Taylor, Laflin & Rand Powder Co.; H. P. Collins, Du Pont Smokeless; B. H. Norton, Hazard Powder Co.; Capt. J. A. H. Dressel and U. M. C. Thomas, of the U. M. C. Co.; W. R. Clark and J. B. Savage, of the Winchester Repeating Arms Co.; Admiral A. G. Courtney and B. Leroy Woodard, of the Remington Arms Co., both of whom were assisted in showing off the guns of their firm by E. D. Fulford, who used a Remington gun and Schultze powder; J. S. Fanning, of the U. S. (Gold Dust) Smokeless Powder Co., who came to the front as winner of the silver cup; Parker Bros. were well shown up by S. A. Tucker, runner up for the silver cup; W. F. Parker, one of the members of the firm; J. R. Hull, and O. R. Dickey, who always shoots a Parker and E. C. powder.

LAMBLIKE PARTICIPANTS.

The list of those who took part in the sweepstakes is a long one. A partial list runs as follows: H. M. Levengston, Saratoga, N. Y.; H. G. Wheeler, Marlboro, Mass.; Capt. E. B. Wadsworth, Boston, Mass.; C. M. Clark (Chase), St. Louis, Mo.; Merritt, Jordan and Coates, Springfield, Mass.; Lambert, Miller and Leighton, Haverhill, Mass.; C. B. Bristol, M. H. Clark, Robertson and Sherman, New Haven, Conn.; Dr. Hammond, N. F. Reiner, Stannels and Griffith, Providence, R. I.; Mills, Bristol, Conn.; Snell, Buck, Nick Parker and A. B. F. Kinney, Worcester, Mass.; Allison, South Weymouth, Mass.; H. L. Edgarton, Willimantic, Conn.; French, Roberts and Hummerston, Thomaston, Conn.; Dr. P. H. Mason, H. P. Dain and E. F. Hill, Peekskill, N. Y.; I. Tallman, A. Tallman and E. J. Foster, Millbrook, N. Y.; C. M. Stevens, Guilford, Conn.; C. W. Tuttle, Auburn, N. Y.; E. L. Post, New York city; J. R. Blamey and Bolt, Holyoke, Mass.; Holmes, Pawling, N. Y.; H. C. Bridgers (Tar Heel), Tarboro, N. C.; Patten, Thompsonville, Conn.; Norwood, Gibson, Knight and Ray, Bellows Falls, Vt.; Avery, Davis and Merriman, Meriden, Conn.; Hazard, Southington, Conn., etc.

WEDNESDAY, FIRST DAY.

The sky was overcast with clouds, and there was a dull light, further dulled by an atmosphere laden with humidity, very "muggy" in fact, conditions very unfavorable for those who shot with glasses. About the most noticeable shooting on this day was that of the squad composed of Fulford, Levengston, Clark, Wheeler and Puck, which in the fifth, a 20-target event, scored 97 out of 100.

In the evening a very pleasant entertainment was given the shooters at the home of Messrs. W. F. and L. C. Parker, which was most thoroughly enjoyed and enjoyable.

THURSDAY, SECOND DAY.

The weather was most unpromising and unfavorable, being rainy more or less throughout the day. The light consequently was very variable, seldom good, and the intermittent changes made varying conditions. Shooting was suspended some of the time on account of heavy rain, yet the programme was finished in spite of unfavorable circumstances of weather. One of the matters of chief interest was the close competition between Messrs. Tucker and Fanning for the cup.

HOWLS AND BAAS.

Capt. Money says that Dickey's targets may be all right to look at, and may be good breakers into the bargain, but that there's no fun in inspecting them when stored with wasps, which disagree as to the propriety of such inspection. On Wednesday morning Dickey took Capt. Money into the upper story of the club house to look at some cases of the Boston target stored therein. Some boys had torn down a wasps' nest, also located therein. Neither Dickey nor Capt. Money was aware of the fact until one wasp stung Capt. Money in his left eyebrow, and also hit him in the cheek just below the left eye. Result: A patch of wet mud on the wound for a few minutes, followed by applications of ice lasting two whole days. And by the way, wasp stings may act as a tonic. Note Capt. Money's run of 69 out of the first 70 that he shot at on the second day, and therefore what he might have done had a wasp stung his right eye.

Jack Fanning thoroughly deserved his popular win of the silver cup offered for competition among the manufacturers' agents. Jack shot well and steadily all through the two days, but Tucker scared him somewhat right at the finish.

All the boys expressed their satisfaction at the good showing made by Tucker in his fight for the cup. "Now," say they, "Tuck can never talk about being a 'has been,' nor deny that he can shoot targets." Results talk, and Mr. Tucker's reports as to his target shooting ability can go no longer.

Admiral Courtney, who had been advanced ten numbers for gallant performances at the trap during the tournament, was reduced twenty-two numbers for losing his target in the tournament. Seriously speaking, the Admiral did more than any one man, outside of Tom Keller, to make the shoot the pleasant social gathering that it undoubtedly was.

Tee Kay of course acted shamefully all the time, keeping everybody on the alert as to what he would do next. In addition to furnishing lots of amusement for everybody, Tom shot a war-house gait, and did not slacken in his speed until the end of the second day, finishing with more than a decent average.

W. F. and L. C. Parker, of the firm of Parker Bros., entertained a large crowd of the shooters at their home, which is situated on top of a hill that struck terror into the hearts of those thick of wind or short of limb. The reception at the end of the climb was payment in full for every puff of breath demanded by the steep ascent, the three-handled mug being a special feature of that same welcome.

The lunch man made a mistake in thinking that shooters only wanted "any old thing" at any old price. He found out his mistake on the second day, and lost sundry half-dollars. Trap-shooters are willing to pay for a good article, but they are reluctant to pay for an article that is inferior.

Elmer Shaner has a speech that he always makes at the commencement of every tournament. When he first made that speech some five or six years ago, it was so well worded and so much to the point that he has never changed it, but lets it rip from his tongue with an eloquence that Bob Ingersoll might envy. And Shaner means every word that he says.

U. M. C. Thomas has only missed two Interstate Association tournaments since they were first started. He got mixed in his dates this time, however, and only put in an appearance on the second day, and then wanted the tournament prolonged so that he might have two days' shooting. He was willing to quit though when Fanning landed the U. M. C. high base shell to the front in the race for the cup.

H. P. Collins and B. H. Norton had a hot race for a long time, but Collins' staying powers proved too much for Norton, and the former finished an easy winner by virtue of a 14 out of 15 and a 13 or two to his credit.

Banks was not in his "usual good form" on the second day, but the rain and extreme humidity made it hard work for men wearing spectacles to locate low targets against the thickly wooded background. He blames Tom Keller for several targets lost on the first day, basing his claim on the heavy cross-buttock that Tom threw him with just after lunch on Wednesday. The fall was funny to look at, but when a 189lb. man alights on his head there's a jar to the earth as well as to the man who fell. T. K. was narrating the incident to Fanning, and added that otherwise he (Fanning) might not have been leading in the average, whereupon Fanning asked Tom to throw him (Banks) again on the second day, adding: And throw him hard, Tom!"

Leroy was out of trim on the first day, his shells not having arrived on the scene of action. When he got them on the second day he showed "what might have been."

Dickey, who has been out of form for some few months, has now found his grip again. Notice his scores on the second day, particularly during the last half of the programme for that day. He is now in it, and will remain there.

Dr. Hammond, of Providence, R. I., shot up well, and more than held his own. He promises to be on deck again at next year's Grand American Handicap. Another certainty for the Grand American Handicap of 1899 is J. R. Blamey, of Holyoke, Mass., who also shot in about every event that was scheduled for this tournament.

This is not the first Interstate Association tournament that Harry Bridgers, of Tarboro, N. C., has attended; not by a long shot. On this occasion he just dropped in by chance, being up north on business and without a gun. He shot W. R. Clark's Winchester, and shot it well too. If Tar Heel handles his law books as skillfully as he handles a pump-gun he will win all his cases, and his success in life is assured.

Chase, of St. Louis, Mo., is a comer for a fact. He handles his beautiful gun, built for him recently by Gastin Renette, of Paris, with more certainty than he did when at the New York State shoot in Rochester about six weeks ago. He is fond of shooting; in fact, he would almost sooner shoot than eat—yet he has a fair appetite too. With a few more months of practice Gastin Renette will cause trouble to wolves and lambs alike.

Just eleven shooters sat down at one table in the Winthrop Hotel dining room on the night of the second day of the shoot. They were the guests of J. S. Fanning, who wanted them to share in the moistening of the cup that he had just won. The party was composed of Capt. Money, Elmer E. Shaner, O. R. Dickey, Edward Banks, Admiral Courtney, E. D. Fulford, Tom Keller, C. M. Clark, W. F. Tuttle (of Chicago), and U. M. C. Thomas (toastmaster). The cup was well moistened, and the speeches were on a par with the fare provided—strictly A1.

Such accurate scoring, such exemplary promptness and courtesy in the cashier's office, and such excellent refereeing as that which characterized this tournament cannot be beaten anywhere.

Seven States were represented at this tournament: Connecticut, Massachusetts, New York, Rhode Island, Vermont, Missouri and North Carolina. The above list does not include the States represented by manufacturers' agents, otherwise we would have to include New Jersey, California and Maryland, making a grand total of ten in all.

The promptitude with which squad after squad stepped to the score without the slightest delay was a special feature of this tournament. There was no break between events neither, No. 1 squad stepping into the places of the last squad of the previous event, thus preserving a rotation that enabled Elmer Shaner to throw about 7,000 targets per day from traps that worked none too well. (N. B.—They were not Mr. Shaner's traps, his old reliables.)

Lambert, of Haverhill, who shot under the name of Bryan, made many a good score, and did considerable booming for the Haverhill Interstate tournament, Sept. 7-8. Mr. Lambert was assisted in this direction by Messrs. Miller and Leighton, both good shots from the Haverhill Gun Club.

Neither the rain nor the extreme humidity could keep Mr. C. B. Bristol, the daddy of the New Haven Gun Club, from taking part in the shoot on both days of the tournament. On the first day he was accompanied by M. H. Clark, the president of the club.

Allison, of South Weymouth, Mass., is shooting better than ever, and is a truly dangerous lamb for any of his fellow lambs to tackle. The way he ground his targets to pieces on the first day was a caution and a warning that no would-be match-maker should disregard.

In the 20-bird event, the fifth of the first day, Messrs. Fulford, Levengston, Clark, Wheeler and Puck made a very superior squad showing, scoring 97 out of the 100 targets shot at.

ON LONG ISLAND.

BROOKLYN GUN CLUB.

BROOKLYN, N. Y., Aug. 1.—Enclosed please find scores of Saturday, July 30, shoot. We had a small attendance, but had a bang-up time. Messrs. J. P. Adams and W. E. Skidmore tied for the Troisdorf cup. The former withdrew in favor of Skidmore, who now has two wins. Mr. Platt Adams won the prize, a handsome shell case. The shower put an end to the shooting.

A new trap-shooting club, the Adrian Gun Club, was formed recently at Adrian, Minn., of which Mr. F. E. Porter was elected secretary-treasurer. One clause of the rules adopted by this club is as follows: "Outsiders shall pay 25 cents for each ten targets." Such a rule discourages participation on the part of outsiders, and thereby discourages possible club members. While outsiders should not enjoy all the privileges of club members, a club on the other hand should not become ultra commercial in dealing with them. Again in ordinary club shoots it is a mistake for this new club to have this rule: "If the shooter fails to adjust the safety, to load or cock his gun, or pulls the wrong trigger, the target shall be scored 'lost.'" "No bang, no bird" is better in ordinary shoots, where there is no considerable sum of money at stake, and particularly so if the club sets forth that its purpose is sport and good fellowship.

WESTERN TRAPS.

PATERSON LOSES THE TROPHY.

CHICAGO, Ill., July 30.—The unbroken series of victories by which Mr. A. C. Paterson has so long retained possession of the Chicago challenge trophy was yesterday interrupted by Mr. Thos. P. Hicks, who stood at 30yds. with a 10-gauge gun and killed his 25 birds straight, also killing his 2 handicap birds, or 27 straight. Mr. Paterson was unlucky enough to miss one bird and so could not come in even for a tie. Both men shot in superb form. Mr. Hicks, as earlier stated in these columns, was among those who earlier made attempts to land challenges for this trophy, but on the first occasion, as he informed Mr. Paterson, was not in time with his challenge. His later attempt was more successful. Immediately at the conclusion of Mr. Paterson's last race Mr. Hicks took the first train down town and mailed his challenge, yet, as he informed me yesterday, he saw on the mailing table even as he passed his own challenge in through the window, the challenge of another contestant. Mr. V. L. Cunnyngham, earlier defeated by Mr. Paterson, and Mr. Ed Bingham also challenged for the trophy, but of the three the challenge of Mr. Hicks was the one accepted by the trustees. Mr. Hicks is one of the three trustees himself, but there were enough without him to pass impartially upon the questions of challenge and handicap, in regard to which I have heard no criticism. Mr. Hicks was allowed 29yds. and 2 birds, Mr. Paterson being placed at 30yds., but the former finally chose to stand at 30yds. and use his old Westley Richards 10-gauge, in which he has the greatest confidence. His judgment as the result seems good, for he shot in splendid style, and if his handicap was wrong his shooting was the severest criticism upon it, though it is not likely he or anybody else will soon kill 27 straight again at Watson's. Mr. Paterson himself shot at 8 practice birds, killing them all, so that he only missed 1 bird out of 33 during the afternoon. He also was in perfect form, and the race was a very interesting and pleasant one to see.

The real secret of the high scores lay in the fact that the birds were not fast, but on the contrary very dull. Out of several hundred birds John Watson selected 180, and told the trappers to pick out the brightest of these. The birds themselves were good, but the weather killed the flying. The day was hot and muggy. During the morning there was a goodish breeze, but at just about 2 o'clock a light sprinkle of rain came and the wind fell absolutely, not rising again to any great extent. John Watson expressed regret that his birds made so poor a showing, and said it was due to the heavy, hot condition of the air. With a good wind the scores would not have been so high. What air there was moving came left to right across the score. A pleasant little gathering witnessed the shooting, and congratulated Mr. Hicks upon his admirable showing. He certainly shot in rattling style. As Billy Mussey once remarked to Mr. Bennett, of Kansas City, "It is hard to beat a man when he kills them all."

The shooting called out no special features, though several times Mr. Hicks made long stops, which brought out just applause. He centered his birds well, and handled the 10-gauge as quickly apparently as another shooter would a 12-gauge. Mr. Hicks' 4th bird required the flag. His 5th was stopped high, badly cut up with the first barrel. On his 6th he was careful with his first barrel and did not need the second. His 7th was killed at over 40yds. in handsome style. His 13th bird was fast and got far out, but luckily he got a wing tip with his first barrel. Again on his 16th bird he was lucky enough to get a piece of wing; this time with his second barrel, meeting much applause for the long stop. Meantime Mr. Paterson was continuing to shoot in the splendid form he has of late been showing. His 6th bird was a slate blue, a twister. He led it to the right just as it ducked to the left, and again it led to the left just as it switched back to the right. It went away untouched, and with it Patti's chance. His 14th bird was a fast one and came in ugly, but was caught in time. His 19th was stopped by good use of the second barrel. His 21st was hard to find with the first, but was centered nicely and saved. Nothing especially hard was asked of him, as not a dozen good starters went out of the traps, something very uncommon at this park and very different from what Patti has met on one or two other occasions, when he did as good work as one often sees. It was good work for both men, for even dull birds are not easy to kill in runs like those shown to-day. In his earlier races Mr. Paterson has made the following scores in order: At 26 birds, 25 scored; at 25 birds, 20, with 3 dead out; 21, with 2 dead out; 21, with 4 dead out; 23, 24, 24, he having shot seven times for the trophy, including the Cunnyngham tie. He would have been glad to win the medal permanently, but will take the sportsmanlike ground of allowing a few others to have a chance at it before challenging again. If Mr. Hicks can hold it as long as Patti did he will do very well.

In the shooting to-day Mr. Hicks used in his 10-gauge gun 4¼ and 4½drs. Du Pont powder, 1¼oz. No. 7 shot. Mr. Paterson shot the same Remington gun which has brought him his earlier victories, using 3½drs. Du Pont powder and 1¼oz. 7s. Following are the scores:

AT OMAHA.

At the last weekly shoot of the Omaha Gun Club, of Nebraska, there was shooting at targets, sparrows and pigeons, and seven men were on hand. Scores:

At 25 targets: Loomis 19, Fogg 17, Parmelee 17, Plummer 17, Townsend 16, Brucker 15, Kimball 16, Hardin 16.

English sparrows, 10 birds, $5: Parmelee 10, Hollowell 10, Kimball 9, Fogg 8, Townsend 7, Plummer 7, Palmer 7, Nason 6.

At 15 live birds, $5:

Loomis .....111111111111111—15 Parmelee .....111110011101111—12
Hollowell .....111111111101111—14 Plummer .....111011111101111—13
Smead .....111101111111111—14

CINCINNATI GUN CLUB.

The new club house of the Cincinnati Gun Club is under construction in St. Bernard suburb of that city. The grounds inclose four acres, and there will be two sets of target traps and one of live-bird traps. The building is 20 by 30ft. in size, and will be handsomely finished and handily arranged. The club has 160 members and the stock is still selling readily. The following are the officers: R. S. Wadsworth, President; Julius Fleischmann, Vice-President; J. A. Penn, Recording Secretary; Fred Dreihs, Financial Secretary; Hon. John B. Mosby, Treasurer; Milton Lindsley, Captain. The Board of Directors consists of the above named officers, with Emile Werk, Henry Robinson and A. C. Dick.

The club will give a tournament, probably Sept. 8-9.

COMING EVENTS.

Mr. W. R. Elliston, of Nashville, Tenn., writes: "We wish to claim the dates of Oct. 18, 19, 20, for a shoot that we are to hold at Belle Meade Stock Farm, Nashville. There will be about $500 added money, and we will shoot two days at targets and one day at live birds. I hope these dates will not conflict with any other shoot and that you will announce same."

Mr. J. C. Thompson, Jr., secretary, writes: "Please announce the nineteenth annual tournament of Canton Gun Club, of Canton, Ill., Aug. 17-18."

Breda Gun Club, of Breda, Ia., holds its second annual tournament, Aug. 2-3, with good attractions.

Sheboygan Rod and Gun Club, of Sheboygan Falls, Wis., will hold a tournament Aug. 14.

Milwaukee Gun Club expects a good entry to be on hand tomorrow, second day of its tournament, now in progress. Men are on hand from Waupaca, Sheboygan, Oshkosh, Green Bay, Eau Claire, Waukesha, Oconomowoc, Columbus, Appleton and Escanaba, Mich. The divitions of money will be 40, 30, 20 and 10 per cent.

WEST SIDE, OF SAGINAW.

At the club shoot of the West Side Gun Club, of Saginaw, Mich., last Monday, Bliss, Meissenberger, Messner and Bastian were tied on 22 for the club medal. They shot off at 25 targets and Bliss won, breaking 24. Brechtelsbauer won the Ditmar medal with a score of 24 out of 25.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

EUREKA GUN CLUB.

The Eureka Gun Club, of Chicago, held its regular weekly contests at the traps on the club grounds, corner Vincennes avenue and Seventy-ninth street, on the afternoon of the 23d, with a good attendance. The shooting was comparatively easy, and many good scores were made. Aside from the trophy event, the team races created considerable interest.

Following are the scores in practice events:

All events were shot from the magautrap.

Events:	1	2	3	4	7	Events:	1	2	3	4	7
Targets:	15	15	10	15	10	Targets:	15	15	10	15	10
A W Adams	13	13	9	14	9	O J Buck	..	10	6	11	10

Embree	..	5	5	..	..	C Antoine	..	..	8	14	7
H Vetter	..	10	5	14	9						

Team race between choice, F. P. Stannard and Ed Steck, at 25 targets, for the price of targets, which was won by Steck's team:

F P Stannard .....24 E M Steck 22
W D Stannard .....23 C Antoine 23
O J Buck.....17 A W Adams 22
H Vetter .....19 Dr Carson 19
W Watters .....19—102 H F Carson .....23—109

This was followed by another at 15 targets:

Dr Carson ..... 9 O J Buck 13
W D Stannard .....15 E M Steck 13
F P Stannard .....14 C Antoine 14
H F Carson .....14 W Watters 10
H Vetter .....13—65 A W Adams .....15—65

Dr. Carson's team won in the shoot-off.

Following are detailed scores in the trophy contest, at 25 targets from the magautrap, classified. Class A was not shot off, Class B won by V. L. Cunnyngham and Class C by W. Watters.

GARFIELD GUN CLUB.

The Garfield Gun Club held its weekly target contest on last Saturday afternoon on the club grounds, corner Fifty-second avenue and West Monroe street. The day was most perfect and the attendance quite good. Some good scores were made. The hero of the day was Al. Hellman, who shoot in Class B, and won the medal in his class on a score of 24 out of 25. While the hero of yesterday, at Watson's Park, commonly called "One Barrel Hicks," who did so remarkably well in his shoot for the Chicago challenge trophy, only scored 20 out of 25.

Following are scores in the practice events:

Nos. 1, 3, 5, 6, 7 were known traps, unknown angles. Nos. 2 and 8 were unknown traps and angles, one man up.

Events:	1	2	3	5	6	7	8

CHICAGO CHALLENGE TROPHY.

Mr. V. L. Cunnyngham has challenged Mr. Thos. P. Hicks for the Chicago challenge trophy; and he expresses a desire that he be allowed to shoot for it again.

A. C. PATERSON.

Brockton Gun Club.

BROCKTON, Mass., July 23.—The scores of to-day's shoot of the Brockton Gun Club are given below. J. S. Fanning, of California, was present, and as usual made friends with all the shooters. He won second average. The scores averaged high, although the targets were thrown fully 65yds. Le Roy shot in his usual good time. Our next shoot will be Aug. 6:

Events:	1	2	3	4	5	6	7	8	9	10	11	12

Burton won with a total of 47.

Trap Around Reading.

READING, Pa., July 30.—Harry Coleman and Michael Keichler, both members of the Henry Clay Association, shot at 50 live birds per man at Heiner's Whistle, near the city, yesterday. At the end of the fiftieth round both men were tied, each having killed 45 out of 50. To decide a bet they shot at ten more birds, which resulted in Coleman killing nine to his opponent's ten. The loser is to furnish a supper to twenty of the members of the Association who furnished the birds

Pottstown, Pa., July 30.—Members of the Shuler Shooting Association held a target tournament on the East End grounds today. The targets were thrown by the magautrap, and some good scores were made. The scores follow:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7

DUSTER.

Mr. H. W. Brown, of Binghamton, N. Y., writes us that on July 28 a match was held there on the club grounds, targets thrown by a magautrap. Each contestant shot at 100 targets: Tracy 87, Pumpelly 90, Kendall 92, Brown 97. The two first named are members of the Owego, N. Y., Gun Club.

Answers to Correspondents.

No notice taken of anonymous communications.

J. W., Plainfield, N. J.—The Krag-Jorgensen rifle is made by the United States Government at Springfield, Mass. It is not sold by dealers.

W. C. D., Jr., Stottville, New York.—Last month as I was walking along the post road a few miles south of Poughkeepsie, in this State, I saw a blacksnake that so far exceeded in size any that I had seen before that I am rather curious to know how large these snakes do grow. I have always thought a 3½ or 4ft. blacksnake a large one, but this snake was nearly 7ft. long and 8in. in circumference. I shall be thankful for any information that you can give me. Ans. In this latitude a 6ft. blacksnake is counted a large specimen.

PUBLISHERS' DEPARTMENT

Golf.

THE Bridgeport Gun Implement Co., 313 Broadway, New York, have just issued a very interesting book on golf, containing full rules for playing the game and many valuable hints and instructions. The book will be sent free on application.—*Adv.*

INVITATIONS were sent out last week by the John P. Lovell Arms Co., of 163-165 Washington street, Boston, Mass., inviting sportsmen to the informal opening of their new store on Wednesday evening, Aug. 3, from 8 to 10 o'clock. The reception, which takes place after this paper has gone to press, will be a pleasant affair.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, AUGUST 13, 1898.

VOL. LI.—No. 7. No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

The Forest and Stream's Platform Plank.

"The sale of game should be prohibited at all seasons."

NAILS DRIVEN IN 1898.—No. 2.

OHIO.

Act of April 12, 1898.—Sec. 6964. Whoever shall at any time catch or kill any quail wild turkey, ruffed grouse or pheasant, prairie chicken, woodcock, squirrel, Mongolian pheasant, or English or ring-neck pheasant, for the purpose of conveying the same beyond the limits of this State, or for sale in the markets of this State, or shall transport or have in possession with intent to procure the transportation beyond the limits of this State, or for sale in the markets of this State, any quail, wild turkey, ruffed grouse or pheasant prairie chicken, woodcock, squirrel, Mongolia pheasant, or English or ring-neck pheasant, killed within this State, shall be fined as provided in Section 6968, and in addition thereto shall be liable to a penalty of twenty-five dollars for each bird trapped or possessed contrary to the provisions of this act.

PRIZES FOR AMATEUR PHOTOGRAPHS.

THE FOREST AND STREAM offers prizes for meritorious work with the camera, under conditions which follow:

The prizes will be divided into three series: (1) for live wild game; (2) for game in parks; (3) for other subjects relating to shooting and fishing.

(1) For live game photographs three prizes are offered, the first of $50, the second of $25, and the third of $10.

(2) For live game in parks, for the best picture, a prize of $10.

(3) For the best pictures relating to FOREST AND STREAM's field—shooting and fishing, the camp, campers and camp life, sportsman travel by land and water, incidents of field and stream—a first prize of $20, a second of $15, a third of $10, and for fourth place two prizes of $5 each.

There is no restriction as to the time nor as to where the pictures have been made or may be made.

Pictures will be received up to Dec. 31 this year.

All work must be original; that is to say, it must not have been submitted to any other competition or have been published.

There are no restrictions as to the make or style of camera, nor as to size of plate.

A competitor need not be a subscriber to the FOREST AND STREAM.

All work must be that of amateurs.

The photographs will be submitted to a committee, who, in making their award, will be instructed to take into consideration the technical merits of the work as a photograph, its artistic qualities, and other things being equal, the unique and difficult nature of the subject.

Photographs should be marked for identification with initials or a pseudonym only, and with each photograph should be given, answering to the initials, the name of sender, title of view, locality, date and names of camera, and plate or film.

ESSENTIALLY A THIEF.

THE term sooner has come to have a recognized place in the language of the field, as designating those gunners who take advantage of their fellows by shooting game before the lawful season opens. The word is not elegant but it is expressive and definite, and happily characterizes this breed of unfair and dishonest gunners. For the act of the sooner unquestionably is unfair and dishonest. The very motive of shooting before the season opens is by unfair means to get ahead of other people, to anticipate them, and by open robbery of their opportunities to deprive them of their legitimate share of game, and the pleasure of its pursuit. The sooner thus stands forth as one not only devoid of those finer feelings of courtesy, consideration and fair play, which should characterize every man and control him in the field as in the social circle, but as lacking also in common honesty; for it is in essence as dishonest to cheat another of his lawful shooting privileges as it is to defraud him in business, or to steal his purse. True, the law does not recognize the sooner's action as on a level with theft, but we challenge anyone to show that the two offenses are not inherently similar in principle.

Nor may the true nature of this shooting out of season be covered up by the claim so commonly advanced by its lawless perpetrators, that they are only exercising a natural right which antedates and supersedes game statutes, and gives them privilege to do as their selfish natures prompt. The public is coming to understand these things more clearly; to see through the dishonest pretense of the natural-righters; and to recognize that those who shout the loudest for their individual natural rights to shoot are the very ones who most brazenly ignore and invade the natural rights of other people. The only natural right to shoot possessed by any man in this country is the right to opportunity—equal with that of all other men and invaded by no other man—to shoot in a way, at a time and in a place open to him by the laws of the land. No man under heaven has any natural or acquired right to take advantage of other men by shooting before the law is off or after it is on. We repeat that he who does so does what is essentially mean, unfair and dishonest, and in respect to such action stands on a level with a common thief. One of these days we shall hear less of the sooners, for, this true nature of their offense recognized, they will have been reckoned with and suppressed.

Meanwhile, this year and next year and every year, game commissioners and protectors and wardens and private citizens will do well to create and establish right public opinion on this subject by taking in and doing for the sooners as the law directs.

PUBLIC AND PRIVATE.

COMMISSIONER TITCOMB'S suggestion that certain selected small trout brooks in Vermont should be set aside permanently as refuges and nurseries is in line with advanced opinion in fish protection and fishculture. The plan is an ideal one; and its realization would mean a permanent fish supply. The one drawback is the difficult problem of carrying the system into effect by providing an actually efficient protection of the reserved waters, so that a brook thus set apart may prove really to be a supply nursery for the public advantage, and not simply a rich find to be looted by sneaking poachers.

The fact is patent that some such expedient as public protected waters and game grounds must be resorted to if we may hope to preserve public fishing and shooting worthy the name. Opportunities which the State, the county, the village have failed to improve have in countless instances been seized by private enterprise for individual advantage. The desirable waters open to public fishing are becoming more restricted every year. In Pennsylvania, for instance, the rule is that all good fishing waters in Pike and Monroe counties are shut up, controlled by lessees and posted with trespass signs. So rapid is the change going on in these famous angling regions that in a few short years, it may safely be predicted, there will be practically no public fishing worth the name. The prevailing system here and in other parts of the country shortly will be of closed streams and lakes. In fact, one who has noted the developments of the last fifteen years cannot fail of conviction that fishing as well as shooting soon will be a privilege to be bought in other ways than by purchase of a railroad ticket to public waters.

The rivers and the lakes will remain open, but the smaller streams beloved of the trout fisher will be closed. This is not to say, however, that there will be just as many anglers and just as much angling. The sport will be established on a basis differing from the happy-go-lucky system of past and present. Waters pass into individual and club control because individuals and clubs stand ready to take them up. When the commercial value of trout fishing as a privilege to be bought and paid for shall be fully appreciated, we need not be apprehensive that there will be a supply fully equal to the demand. And the system will so adjust itself that the cost of an outing on a protected stream, when the tangible results of the fishing are considered, will not exceed the sum one must now expend when visiting public waters. In other words, while the sport may be more expensive, there will be more substantial reward for the outlay.

THE FOREST RESERVES.

AMONG the appropriations in the sundry civil service bill is one, hardly noticed as yet by the newspapers, which is of real importance. It provides for the payment of forest inspectors, supervisors and other employees, and the amount set aside for this purpose is $75,000. The appointments, some of which were given last week in the FOREST AND STREAM, are made directly by the Secretary. It was certainly high time that some provision was made for the maintenance of our forest reserves, and each step taken in this direction is one in advance, and tends to strengthen the movement for forest preservation. That money has been appropriated to pay a force of forest employees, and that these employees or some of them have been appointed, is most encouraging. The paragraph in which the appropriation is made reads as follows:

Protection and Administration of Forest Preserves:

To meet the expenses of executing the provisions of the sundry civil act, approved June fourth, eighteen hundred and ninety-seven, for the care and administration of the forest reserves, to meet the expenses of forest inspectors and assistants, and for the employment of foresters and other emergency help in the prevention and extinguishment of forest fires, and for advertising dead and matured trees for sale within such reservation; Provided, That forestry agents and supervisors, and other persons to be designated by the Secretary of the Interior for duty under this appropriation, shall be allowed per diem, subject to such rules and regulations as he may prescribe, in lieu of subsistence, at a rate not exceeding three dollars per day each, and actual necessary expenses for transportation, seventy-five thousand dollars.

The long and bitter fight against the reserves thus ended not only in continuing the reserves, but in providing a force for their maintenance, and funds to pay this force. While it may well be that this force at first will not accomplish great things for forest preservation, the fact that it has been established cannot fail to greatly aid the progress of the work.

There is a law in New York which forbids, under heavy penalty, having in possession live song birds, including the robin. As an illustrative commentary on the prevailing ignorance of this law, or indifference to it, may be cited a robin case which came up in one of the courts in this city last week. A sixteen-year-old boy, Adam Redwitz, was arraigned for having stolen a caged robin from Charles Mucha, an uptown shoemaker. In a struggle between Redwitz, Mucha and the neighbors, the robin was nearly pulled to pieces, but finally escaped and flew away. The magistrate held that, as no one had seen the boy steal the robin, it might have been at liberty when the boy took it, and in that case, having won its freedom, it was nobody's bird, and could not be subject of larceny. It appears not to have occurred to the magistrate, nor to any of the authorities, game protectors or others, that the man who claimed ownership of the bird was himself subject to a fine for its possession. Probably not one magistrate in New York to-day knows that the law forbids the possession of robins.

The pursuit of the upland plover shows an anomaly in the field shooting code, for while it is forbidden and tabooed to shoot birds other than flying it is the practice of upland plover shooters to pot them on the ground. The mode is defended by the plea that the plover is so shy and wary that it is permissible to circumvent him and to take advantage of him without giving him any law. Men who would scorn to bag their quail by a ground shot have no compunction whatever about the plover, and among their fellows make no concealment of their ground shooting. This has its parallel in duck shooting, in which pursuit some men—perhaps a majority of the duck shooters of the country—kill the birds on the water; or endeavor at least to get one shot at the bunch on the water with the first barrel, and a second shot as the birds rise in the air.

One of the fascinations of black bass fishing, as the angler becomes more and more experienced in the art, is a growing appreciation of how meager and baffling is one's knowledge of the fish. When a veteran fisherman is asked to tell us what he knows about bass, he is very likely to respond by telling us of the things that puzzle him, that he does not know and cannot find out. This is an undertone of Mr. Van Cleef's paper this week on the black bass of the Bay of Quinte. As in so many other things, it is only the novice in bass fishing who knows it all.

The Sportsman Tourist.

Days and Nights in West Virginia.

As I stepped into the Continental in the middle of June my hand was grasped by a Southern friend, who immediately proceeded to take possession of me. When I informed him that I was worked out, in his cheery way he remarked: "Come and go home with me, and I will knock off work and go fishing with you." The affectionate request was again repeated, and in an hour's time my arrangements had been made to go South with my friend, who is one of the figures in politics and business in that country. On the splendid Chesapeake & Ohio by 4 o'clock in the evening I was flying toward West Virginia, of which State my friend had been the preceding Governor. The trip was most enjoyable as we sped through the historic battlefields of Virginia to the scene of Stonewall Jackson's great battles, and then over the Alleghany Mountains into West Virginia. We alighted ere long on the banks of the Kanawha River at the beautiful old town of Charleston, which is situated at the confluence of the Elk and Kanawha rivers. I was immediately taken to the home of my friend, and the next day we were to go fishing.

One of the first things to remind me as I entered the home of my friend, that I was no longer in my Northern city home, was my introduction to the bloodhounds. It was my first experience with these strange animals. My friend explained that the inspection which was made of me by them was one of curiosity alone. First came majestic Bevis, a huge, tawny, lion-like looking fellow; the inevitable day and night companion of my friend. Soon he was reinforced by Jason, a long-eared, solemn, red-eyed fellow. They smelled me, sniffed at my clothes, looked me over, and walked around, making a most thorough investigation of me in every way, but never allowing me to touch them. By some influence it was soon known that a stranger was in the house, and Malta, another beautiful one of the same breed, added her presence to the company of long-eared inspectors. Her coming was the signal for another thorough investigation from all three. I was evidently in dog life being thoroughly "taken over," and when my friend showed me to my room, as is the Southern custom, the whole crowd trooped up the stairs with us. It seemed to be accepted as a matter of course, and when I merely suggested injury to carpets and rugs my friend remarked with somewhat injured voice that "My wife will only allow four of them to come into the house."

This old-fashioned house, surrounded by trees, with its broad porches, big rooms and wide hall, filled with the souvenirs of campaign and field, would delight the heart of Mr. Hough. My friend is a mighty hunter and great fisherman. Huge fish spears, fishing nets, guns, and boating oars, and heads of fish and fowl adorn almost every part of the lower house. He has a great collection of the old-fashioned mountain rifles, famous in Kentucky and Virginia as being the best guns ever laid to a man's shoulder. He has a magnificent weapon, 6ft. 2in. in length, which belonged to the grandfather of the famous Anse Hatfield, of whom more anon.

Another one played the chief part in a strange and terrible tragedy, which my friend related to me, and which some day I will give to the FOREST AND STREAM. I asked him to allow his collection of rifles to be shown next year at the Sportsmen's Exhibition at Madison Square, and he has consented to do so. He has here an elephant gun, weighing 50lbs. and carrying a 2½oz. ball, being one of the guns carried by Stanley on his second African expedition.

I was interested in one piece which hung upon his wall. It was an Irish shillalah, from Donnybrook, Ireland. I for the first time found that the shillalah had to be made within certain lengths and weights: Not over 2ft. 2in. in length, 2½in. in diameter, and 4lbs. in weight. A strong leather thong is passed through the end which is run up half-way to the elbow, and the stick is grasped like a quarter-stick. At some future date I will give the readers of the paper an account of some of the adventures from Florida to the Rocky Mountains which my friend graphically related to me while sitting surrounded by those souvenirs.

On the next day the Governor's private car and a railroad flat, upon which were two boats, were hitched to an engine, and there was a shriek of the engine, a rattle of the wheels, and we were carried into the wilderness. We were taken without stop into Clay county, where the car was put on a siding and left in one of the most beautiful places I have ever seen. This seemed to me the paradise of the lover of the forests and the idealism of the life of the hunter. We were in the absolute depth of the mountain forest, yet having with us the conveniences of a beautiful home, the best cookery and the most pleasant beds. We immediately began putting the boats in the river. When I saw the Rushton boat, double ended, copper riveted, shoved into the river, I was carried back to my old St. Lawrence home. The Governor could not fish with me to-day, and I was turned over to the tender mercies of his fisherman, an ebony-hued son of Ham by the name of Frank Lee. Soon my friend bade me good-bye, and I was left to his tender mercies. The plan was for me to go up the river and in the evening catch my host, who was engaged in professional matters about six miles up, and then we would come down together.

I used the fly exclusively. My boatman, one of the most magnificently built men I have ever seen, knew every rock of the beautiful river. With a deft stroke he took me to the most inviting places. Without looking he seemed to know where lay the bass, and the sport was as fine as I have ever witnessed on any of the waters of the United States.

Before we were out of sight of the car I struck, and a splendid black warrior came out of the water with the "Baltimore" hanging to the edge of his lower jaw. "You hev jes' got him an' no moh," remarked Frank, and I knew it. Up the river and down he went with 75ft. of line out. With a quick side jump up, and a crosswise fall back, he tried to get away. I have never as yet determined whether this sidewise fall back on the line was the result of accident or design. It was marvelously like design, but it did not work this time. A peculiar feature of the black bass of this section is that there is no sulking. It is with a rush and a fight to the end. So it was here. There was not a minute of the twenty that I was engaged in this fight with this splendid fellow that he was not in it with a rush. Every art was tried. He sent the swirls of the line cutting through the water, and then with a dive in the pools, once clear under the boat, when he nearly got my line. But the inevitable end was at hand. The boat was allowed to drift into quieter waters out of the rushing swirl of the shoal, and just under the lay of a big rock, and with the bright sun glinting through the trees, Frank deftly captured him in his net. He weighed 2½lbs. In any of the quiet Western or Southern waters a fish making such a fight as this would weigh 4 or 5lbs. When I met my host in the evening he told me that the difference between the bass even in the nearby rivers was perfectly perceptible. His experience was that the bass from the Ohio River, where the waters were quiet and somewhat warm, was a heavy, thick-shouldered and short fish. That the bass up the Elk River was longer, thinner and more like a fighting machine. The bass in the Guyandotte, which stream is cooler and more rapid than either the Elk or the Ohio, is a gamier, longer, more slender fish than either of the others. His jaws have more of the tigerish expression, and he is a typical game fighter, and this comes from the fact that his means of existence are harder and he has a greater struggle for life in the swift, cool, rapid waters of the Guyandotte.

We went up the stream about six miles, and at every shoal there was a battle. At one shoal I hooked the king of the water. In the rush of the water it was impossible to hold him in the boat, so I went into the water and followed him. Now in one channel, now in the shoal, and again in the deep water, part of the time I was on shore and the next minute in the water half up to my waist. He was finally led into the running water at the foot of the shoal, and there the little 8oz. rod beban gently, but firmly, to bring his lordship to the shore. After five wonderful rushes I led him into a little pool, and he was mine.

Following the meanderings of this beautiful river, that evening was spent in the delightful sport. It was a wonderful day, and when we landed for my friend we had twenty-seven splendid bass. We added six more on the trip to the car, and the last two hours, with the lengthening shadows falling on the placid waters, will always be one of the brightest spots on my mind. That night was spent in the car. The Governor's black cook was a marvel with the bass.

The night was even more pleasant than the day. It was one of the scenes which enshrouds itself around one's memory for all the days. The servants had brought out the chairs to a fragrant grassy place just out from the shadows of the trees. The night of the South had come; a kind of opalescent night known only to these Southern latitudes. Below flowed the beautiful river, its dim outlines appearing as a ribbon of gray; its murmering voice now falling in almost regular cadence on the ear as the soft night breezes caught it up and brought it to us on the mountain. Ever and anon its rhythmical flow was broken as the pike with a rush grasped its prey, or the bass with sudden splash made its stroke for the minnow, or the red horse or gar made their fierce dash on the bar for their prey. A splash and a rush, and the tragedies of the waters were over, and the sweet cadence of the water again resumed its place on the quiet night tide. Near to us could be seen the dim outline of the car with a dim light just seen in the dining room. Away at the farther end could be heard the soft voices of the negroes as, impressed by the influence of the night of the woods, they spoke to each other in the musical voice of this Southern race. The mountains were silent, yet it was that whispering silence which carries with it tone and voice,

> "That sad and solemn sound,
> Sometimes heard overhead and sometimes under ground."

The night wind brought with it not only the sweet mysticism of the Southern night, but with it came the soft odor of the grape blossom, the delicate fragrance of the cucumber tree, the magnolia of the Virginias, mingled with the aroma of the chestnut blossom. Ere long the shrouded night began to give way to a silvery gray. Away on the other side of the river appeared a radiant line of silver on the dim mountain top. It broadened and grew and glorified the tracings of the mountain, spreading its way down over the river and changing its gray into silver.

> "And yet so still is all
> That if a bird's nest slipped its airy tether
> There would be sound and feeling in the fall
> Of one light feather."

With the soft moonlight flooding this wondrous valley came the myriad notes of the whippoorwill. In all my wanderings in the woods of the world I have never seen an awakening of the woods compared with that which I witnessed in the moonlight in the midst of the West Virginia mountains. On every side came the sweet murmuring sound of the whippoorwill mingled with the twitter of the night thrush, and all added their glory to the moonlight flooding the mountain, river and valley.

> "Night! and the South! and June!
> Silence—and yet the sound of many voices!
> And now, dashed down the darkness, tune on tune,
> And melody rejoices!
>
> Clear through the awakening night
> The music rushes—all the joy-bells jingle;
> And every leaf is trembling with delight
> Born of that singing!
>
> Night! and the South! and June!
> The wind awakes; the river sings its story;
> Up from the black hills climbs the brimming moon
> In full-blown glory!"

As we sat there drinking in the wondrous moonlight panorama of silver-tinted river, mountain and valley, my friend with a wave of his hand said: "Do you blame me for not giving up this for the life and ambition of the city?"

Frank Stanton, our Southern poet, was right when he said:

> "I wouldn't nigh be guv'ner, though it's kinder great to be,
> An' the Georgy Legislatur' ain't a drawin' card fer me!
> An' as fer that old Congress—now, what's its biggest seat
> To a feller on a river bank with lilies at his feet?
>
> Jest let 'em take the offices an' keep 'em in a whirl!
> I'd ruther have a vi'let from the sweet hand of a girl
> Than run the whole United States! So let the country roll!
> For a streak o' April sunshine is a-lightin' up my soul."

I have often wondered from what source the Southern poetry drew its inspiration. I know now it is from the marvelous witchery of the nights.

The next day in the early morning, with my friend at the bow and I at the stern, we continued the sport, and when we arrived at the car in the evening we had a string of thirty-two beautiful fish. The river is picturesque, and the beauty of the sport was added to by the surroundings of mountains and forest and sparkling river. The sport was ideal. We found the most of the bass at the foot of shoals, just where the curling water ran into the pool, and with my friend on one side and I on the other we frequently caught fish in the same pool. In the evening I caught a double, and it was grand sport. With the two big fish fighting and pulling each other here and there in the water, a great part of the time the fight was in the clear shallow water, where we could easily see the contest.

In the evening the proposition was made that we spear for red horse and gar in the fast water. It was one of the most weird, exciting and ghost-like evenings I have ever spent. We secured a long canoe, such as our forefathers used in these waters. This one was at least 50ft. long, beautifully curved at both ends, and hollowed out of a single tree. I was amazed at the deftness with which the lines were rounded on this canoe. It is managed entirely with poles, and at each end there is a crate which is filled with cannel coal. This makes a tremendous light, as the coal is composed largely of oil. We started the canoe in the upper part of the shoals and let her fly like a whirlwind, keeping her straight and spearing the fish as they lay on the bar in the shoals. The river is filled with pike, a great number of red horse and gar, and it requires a quick eye and a powerful arm to drive the big spear into these muscular fast-water fish. I was unsuccessful in killing any of the fish, but ere long my friend had struck a tremendous pike, and in the swift water was having the fight of his life. His object was to hold the spear into the fish until he got into quieter water and force the fish along with his canoe. It takes great muscular power and great steadiness to stand in the rocking boat and drive the spear deep enough into a big alligator gar, or a large red horse or pike. He killed a pike 4½ft. long and a half-dozen of the horny headed gar, and two red horse. The scene was certainly weird and ghost-like. The flames lighted up the whole river and the banks on either side. Amid the flying waters was the long, thin boat, manned by two powerful mountaineers, using their poles to keep her straight, while in the bow was the tall form of my friend, bare headed and bare armed, driving the spear into the fighting fish. The lights cast an uncanny glare over the silent mountain and the quick going river. Several times when a shoal was particularly full of fish the men sprang out of the canoe, ran her up stream along the shore and then drove her down through the rushing waters. It was a sport very exciting, but I must confess requiring too much exertion for me, but my friend seemed more at home here among the fierce waters than he did in the quiet waters with the fly-rod.

In the morning we went to Charleston, and on the way we visited Mount Pisgah, one of the high points of the Alleghany Mountains. It is in the mountains of Elk.

Winding around the mountain over a beautiful road overhung with fragrant foliage, almost tropical in its efflorescence, we came to a camp-meeting ground and to a beautiful hotel. Indeed a lovely place in the wilderness, the lower hill country, the winding river and the wealth of mountains appearing like some immense beautiful pictures through the occasional arches of the forest. Then on another mile over the shoulder of the mountain and the view from lordly Pisgah came like a revelation. When the wonderful sight broke upon me in the grandeur of the soft sunlight, and the sacred name was told me, I was carried back to God's prophet as he looked from the mountain to the Promised Land, and the beautiful words of Alexander came thronging to my mind:

> "And had he not high honor—
> The hillside for a pall;
> To lie in state while angels wait,
> With stars for taper tall;
> And the dark rock pines like tossing plumes
> Over his bier to wave,
> And God's own hand, in that lonely land,
> To lay him in the grave?"

Without irreverence I could well say that the old servant of the Lord could have found here a resting place almost worthy of his grandeur. As far as the eye could reach there was a scene of mountains wooded and rounded to their full height. Here and there, in sight, are four great rivers and many lesser ones. Over the Kanawha River, fifty miles away, a storm was raging, hiding the river valley under its lightning and clouds. We were above, but in full view, of the black clouds enveloped in their garments of lightning. To the south all was silent as the yellow Southern sun fell lovingly upon mountain and valley. From many narrow valleys came a thin veil of mist, denoting a river, above whose bosom the mist lazily floated and dallied. In the distance, as it waved to and fro, it seemed as a veil upon a beautiful woman's face. East and south could be seen the mountains of Virginia and Kentucky, and over them brooded a silence as of the night time. Away off could be seen many places on the mountain sides where under the gleaming cliffs the mountain man had made his home. Ever and anon could be caught the gleam of the beautiful Elk River as it followed its winding valley, and away off like a cloud of bright winged birds could be seen a cloud of gray mist hovering above the falls of the Kanawha. It was a wilderness of wooded mountain with an occasional clearing marking the field of corn

or the buckwheat or the barley on the mountain side. This was one of the most loved homes of the Indians, and the beautiful, quiet mountains around me, whose only shadows came from the fleecy clouds, or the vulture's or the eagle's wing, were the scenes of some of the most deadly tragedies when the original inhabitants were thrust further toward the western sun.

They have here in the State House one of the most interesting historical societies, and through the courtesy of my friend I was enabled to obtain much unpublished information concerning Daniel Boone. Daniel Boone lived in this county, and represented Kanawha county in the Legislature in 1781. Boone was put in charge of the garrison here in 1774, and was appointed lieutenant-colonel. When he went to Richmond he went there on foot, accompanied by his rifle and his hunting knife. He lived about four miles from West Charleston, just opposite the Daniel Boone salt furnace. Dr. Hale has gotten a vast deal of information concerning Boone, and has been indefatigable in obtaining all the information possible concerning this noted man in this section. Mr. Jared Huddleson, son of Paddy Huddleson, told Dr. Hale of his first acquaintance with Boone. A stranger came to the house and asked to stay all night, and in the morning he went out to hunt for beavers, and he told Huddleson that he had found fresh beaver signs near the house. They went out and caught five the first day, and in a few days had exterminated the whole colony. Boone saw the signs of the beaver on three saplings, which formed a triangle, and he caught the beavers before they had cut down all three of the saplings, and one of them is a red oak still standing. After that they went down the river to Gallier county, and there they caught a number of beavers. Afterward Boone gave his friend his tomahawk and his beaver trap, which he called "Old Ike." The beaver trap is here in the Historical Society, and is a splendid work of its kind. The trap is a heavy wrought iron trap, without teeth, made to be sprung down on both sides, and strong enough to hold a bear, a beaver or a fox, and he used it for all three purposes. The trap was made by Isaac Van Bibber, an expert blacksmith in this country in the early days. Van Bibber was afterward killed in the battle of Point Pleasant. He gave the trap to Paddy Huddleson, who afterward gave it to his son, Jared Huddleson, and by him it was placed in the historical rooms through the efforts of Dr. Hale. It is perfectly preserved, and is one of the most interesting relics I have ever known. There is no question as to its authenticity, and it has for all the years been in the control of the Huddleson family, who are the most respectable people in this county.

This was one of the most interesting sections of this country, as it is yet. It was the dividing line between the West and the South, and the Indians always went by this route when they went from Ohio and Illinois to massacre the Virginia settlements. This was the place where they made their salt, and it was here also that the whites came to have their salt made in the early days, and both sides watched for the other when they were engaged in this useful occupation.

They have here one of Boone's original surveys, written in his own hand and signed with his name. I have seen and had in my hand the original paper, and for the edification of our readers I will give it to you in full. Boone was a great surveyor, and surveyed a number of lands while he was here. He had fought all over this territory and thoroughly knew the whole of it. He did the marking with his tomahawk and they have here a number of the lines which he ran, marked with his initials, "D. B." Several of these are here in the office, and are noted relics of this noted man. Below is the survey with all the peculiarities of spelling:

"June 14th, 1791.

"Laide of for Willeam Allin ten acres of land situated on the South Este Side of Crucked Crick in the County of Canhawway and bounded as followeth: Viz., Beginning at a rad oke and Hickury, thence North 56, West 23 poles to a Stake; thence South 56 Este 23 poles to a Stake, thence South 34, West 58 poles to the Begining.

Daniel Boone."

On one of his trips up the Gauley River, which is one of the rivers flowing into this lovely country, Boone went to the great yewpine forest and was struck there with the magnificent growth of the yewpine, which was commonly known as the yewpine or black spruce. He trimmed off one of the small tree tops and brought it home to show his friends in this section as a specimen of new pine, and polishing it down made it into a walking stick, which he gave to his friend, Matthias Van Bibber. It has been carefully preserved in the family, and was given to Mr. John L. Cole, a relative and connection of the Boone family, and is now here in the Historical Society. It was worn by the hand of this great old hunter, and was one of his constant companions.

I wish I had the space to give you some of the incidents of Boone's career in this county. Among other things I found out that which I never knew before, that Kit Carson's mother was a relative of Boone, and that they were of the same stock, and second cousins. Simon Kenton, the great Indian fighter, and Boone's closest companion, also lived in this county, and here he hunted and trapped and sold his pelts at the mouth of the Kanawha. It is right strange that this county should have been the home of two of the greatest Indian fighters that the world has ever known. Boone, when he left here, embarked for Missouri right at the mouth of the Elk River at its junction with the Kanawha, which is about 500yds. from where I am staying with my friend in the city of Charleston.

But to go on with the Historical Society. They have here also his gun, which is probably one of the most famous weapons in the annals of this country. The Van Bibber family is a very noted family in this section, and as I have said before, it is one of the families with which Boone was connected in his life in this county. The rifle is known as the Van Bibber rifle. Its stock and barrel are 5ft. 4in. long; it carries an ounce ball, and was originally full stocked, but in a fight with a wounded bear, which sprang up just as he got close to it, the muzzle part of the under-stock was torn off by the teeth of the fierce animal, and Boone then covered it with a heavy stock to the hand holt. It is brass mounted, and is in perfect order, and has about 2½in. drop. I notice that this drop is peculiar with all of the rifles of this description.

As I have said before, Matthias Van Bibber was Boone's closest friend here. Van Bibber carried this rifle at the battle of Point Pleasant in 1775, and he also carried it in the war of 1812. With this rifle is the original powder horn and bullet mould, and a fine old shot pouch, but Dr. Hale informs me that this was not the original shot pouch. A pocket compass with a sundial attachment, and a steel square-pointed needle for fixing buffalo hides and an attachment for carrying beaver bait, with a tally stick for keeping the days of the week and the month on the part of a Western expedition, and a part of Van Bibber's commission in the war of 1812, are also in the collection. The rifle is in splendid condition, and could be used to-day if necessary, and Dr. Hale is inclined to think that the gun was constructed in this country. The lock is an English flint lock, and is one that has been in continual use. Dr. Hale handed me a flint that had been in the gun at the battle of Point Pleasant in 1774. He received it from James Van Bibber, who says that it has been carefully preserved in the family since that time. This is possibly one of the most interesting collections of Boone relics in this country, and thousands of dollars have been offered for the collection, but of course refused. Dr. Hale has devoted a great deal of his time getting together this collection, and is thoroughly conversant with the whole history of Boone's experiences in this county, and from him I have gotten the information which I have given you.

Here they have also what is known as the Dick Pointer gun, with which the negro slave killed a number of Indians who were getting under the house in an attempt to take Fort Donnally, which is about ten miles from Lewisburg.

Boone's father and mother moved from Berks county, Pa., to the banks of the Yadkin, N. C., and on the stone fireplace of the home place Daniel Boone carved his name. This has been known for a long time, and Dr. Hale went down there some three years ago and recovered the jamb, and has it here in the Historical Society collection. It will be noticed that Boone sometimes signed his name Boone and at other times Boon, and here he cut his name Boon. The old residence was burned down and the jamb was cut out of the hearthstone. On a beech tree near the Yadkin home Boone had also cut his name, which on the bark is still legible, and Dr. Hale has also placed this in the Historical Society collection.

They have here a fine engraving of Boone, taken from a painting. It shows the make-up of a splendid character, which has been lost sight of by his biographers. Instead of a mere hunter and trapper and Indian fighter, he was a wise counsellor and a clear-headed man in all of the great affairs then taking place in this country. He had a splendid mouth, a handsome forehead, a vigorous nose and a strong, determined chin, and his hair to the last was full and heavy and is entirely white, and in his deep eyes there is the mark of a strong and able man. When this portrait was taken he was about eighty years old. It is a grand face, without a weak spot in its make-up.

The collection of relics in this society is one of the most interesting in this country. It has been gotten here in this strange country, which seems to have been a kind of debatable ground throughout all times. They have here the most extensive mounds, from which have been taken strange and weird relics of the other times, and on the banks of the Kanawha River, not far from here, are the remains of quite a large city, and just above here on Armstrong Creek is a wall which extends for several miles along the crest of the mountain, and no one can exactly understand the reason of its construction. It is splendidly preserved, but for all purposes of defense it would be useless, and there is no burying of any of the inhabitants under it or about it. At some day when I again visit this country I will give you a more detailed account of some of this interesting collection.

As I passed out of the room I was forcibly reminded that we were in the South. On the right-hand side as we went out there was an oak post which had rotted at the top, the lower parts being well preserved. Upon inquiry I found it was a whipping post which for years had known service in the punishment of slaves. This whipping post is a peculiar illustration of this people among whom I am staying at present. They are the soul of kindness and hospitality, and yet under all there is a strain which makes them approachable only to a certain extent. I have a Southern friend who is gentleness itself to children, the soul of chivalry to women, yet he has been "out" twice, and has been engaged in half a dozen most desperate affairs. The Southern people are the most interesting people I have ever met, and everywhere I hear expressions of approval that the days of slavery and the whipping post are over.

My host, after a few days at home, was engaged in some business matters over on the Guyandotte, the home of the Hatfields, and there in the midst of that mountain people I spent three of the most interesting days in all my experience. At my earliest convenience I will give the readers an account of fishing on the Guyandotte among the Hatfields and McCoys.

E. P. Messerer.

A Tacoma restaurateur has found a way to keep venison on his bill of fare all the year round. He buys wild Hudson's Bay sheep from Fort Nisqually and cooks the meat in such a way that it tastes gamy and very much like deer. A few days ago Game Warden Keihlmeyer swooped down on the restaurant, got a piece of the meat for evidence, and had the restaurateur and his wife arrested on a warrant issued by Justice Smalley. At the hearing the process of venisonizing mutton was explained by the defendants, and the court, being satisfied that the State game laws had not been violated, dismissed the case. The names of the defendants were suppressed. Their restaurant is thronged every day by Eastern tourists clamoring for "venison," and it would be a shame to spoil their game, especially as it is not considered a sin to "do up" Easterners.—Morning Oregonian.

The Lucky and the Unlucky.

Podgers' story of fate in Forest and Stream of June 23 well illustrates that which, for want of a better name, people call "luck." But what is luck? Can anyone explain why certain individuals, or things, are constantly lucky, while others are unlucky? We see some people continually losing and others winning at raffles and similar games of chance, where skill cannot possibly have any influence; and in shooting and fishing matters are still worse. Good sportsmen, working hard in places that are noted for game, are often unsuccessful, while men of no experience and taking little trouble to find game may be very fortunate. Many cases of this kind are so remarkable that they are enough to make one superstitious.

The most extraordinary instance I ever knew of long continued luck occurred in 1863, when I was stationed in Montreal. I had obtained two months' leave of absence, and was in the act of starting alone for the River Ottawa, in order to travel into the Hudson Bay territory, when an Irish gentleman (J.) met me at the railway station, bringing a letter of introduction from a friend, who asked me to assist him in obtaining a chance of shooting some deer.

J., as I afterward found, was a first-class shot with the scatter gun, but totally without experience at large game. In addition to a shotgun he had brought from home a double-barreled muzzle-loading rifle of .577 bore, about 9lbs. weight, and constructed for the charge used in the army rifle of that period, viz.: 70grs. of powder and a solid conical bullet of 530grs. From constant practice, he had become a good and quick target shot, and well acquainted with the trajectory at sporting ranges.—which was very necessary, for the bullet made a high curve in its 100yds. flight.

My only weapon was a muzzle-loading .14 bore shotgun, weighing 8½lbs. It had been made 1½lbs. heavier than usual in order to carry ball, with which it was very accurate up to 60yds. As we were starting in the beginning of September, J.'s best chance of sport was with hounds.

After buying a cotton tent weighing 10lbs., and a few other articles for use in camp, we went to a district some distance south of Ottawa city, and joined a party of settlers in an outing to a beautiful lake, where we stayed a few days. Only one deer was found, and it swam near the canoe in which a settler was paddling J., who shot it.

We then traveled for a whole day by steamboat, stage coach and buckboard to a newly-built village, where we heard that deer were numerous. We put up at the only hotel, and became acquainted with several of the settlers, who were fond of hunting. They used to put their hounds into a tract of bush three or four miles broad, between the village and a river, which was about 80yds. wide. In this there were numerous shoals at which the deer usually crossed when pressed by the hounds, and each hunter was stationed to watch one of them.

The first day a large doe galloped to the runway where I was standing, and I killed her with a shot through the shoulders. After that I never had a chance at any game larger than a duck or grouse during the whole month in which J. and I traveled together. On the following morning two deer went to the shallow which he was watching, and he bagged both with a bullet from right and left barrels. On several occasions the deer did not cross at the places where the hunters were waiting, but altogether ten more were killed. The runways were chosen for each man, apparently by chance, and no one could tell beforehand at which of them a deer would pass; but wherever J. happened to be, there the animal went on nine out of the ten occasions. He well deserved his luck, for he killed every one, and although his rifle was a large bore, yet the velocity was slow, and it was necessary to hit in or near the right place in order to insure bagging.

After leaving the village, we traveled by buckboard and canoe to a small log-built hotel on a portage at the head of a lake, eight miles from the nearest clearing, and remained there more than a week. The owner had no gun, but kept a hound, which he put into the bush near the lake on three or four different days. Only one deer was driven out, a fawn, which ran through some shallow water, and of course went within shot of the canoe where J. was sitting, and was killed.

One evening J. was strolling alone, rifle in hand, near the hotel, and met a deer, which he shot. The following evening he killed another deer in exactly the same way.

During a solitary ramble I had found a swamp containing numerous bear tracks about two miles from the hotel, so one morning we went with the owner and his hound to try and bag a bear. While passing through some some dense bush the hound gave tongue, and after running a short distance the sounds came from one spot, making us think he had brought a bear to bay. While pressing forward to get a shot I found myself some distance ahead of the other two, and within about 40yds. of the hound, but could see nothing, owing to the closeness of the bush. The hound and his quarry then moved rapidly away, and the hotel keeper, hearing them approaching, advised J. to stand still. In a few moments a deer passed within 5yds. of them and J. killed it.

A day or two afterward I left J. and proceeded as far up the Ottawa River as the time remaining at my disposal allowed. I saw J. at Montreal when he was returning to Ireland. He had bagged altogether seventeen deer, some of them with fine heads, which he had preserved.

One of the most unlucky men I ever knew was an intimate friend and good sportsman at the same station as myself in the north of Bengal. If he invested money in a commercial enterprise it was almost certain to fail. If he bought shares in an established concern that was promising well, the market price would fall immediately. If he bought a good horse some accident was certain to happen which no foresight seemed able to prevent.

The strangest of his misfortunes occurred when we were shooting together from elephants in the Terai jungles, near the foot of the Himalayas. We had dismounted at midday to take lunch under some trees, leav-

ing our guns and rifles in the howdahs, as the safest place for them. (Every sporting howdah is fitted with a rack for guns, the butt of each resting in a kind of socket and the barrels reclining in a deep groove.) While we were eating there was a loud explosion in my friend's howdah, and we found that his 60 guinea, double .50 bore express rifle had been thrown out of the rack, and that one of the hammers was broken off the lock.

So far as we could judge, it appeared that, when falling, the firing pin struck against something, so as to explode the cartridge, and the violent recoil had knocked the hammer, which was at half-cock, against the edge of the seat.

Almost every elephant relieves the monotony of his leisure time by some special way of fidgeting. One constantly jerks his ears; another rocks backward and forward diagonally between a fore and a hindleg; a third raises the trunk above his head and lets it fall between his forelegs; but we could not discover what peculiar kind of fidgetting had thrown the rifle out of the rack. Any other man's rifle would have remained in it.

The Hindoos, believing as they do in reincarnation, account for a man being fortunate, or the reverse, by saying that he is being punished or rewarded for the good or bad acts which he did in a former life on earth. Perhaps this may be the true explanation of that which we term "luck."

J. J. MEYRICK.

SOUTH DEVON, England.

Highways and Byways.—II.

THE trip across the reservation had much more of business than of pleasure connected with it; so immediately upon my return I determined to put a week or two of loafing into the year's history. Diamond Cañon, the stamping ground of the last two years, was the place chosen, and a party was at once made up. Unfortunately the day before the time fixed for departure the son of my companion was thrown from his horse and so seriously injured that his father did not dare leave home. This left me to do the honors for a party of five ladies. In bygone days my wife has insisted upon taking her rod and wading wherever I would, but this year she lay on her cot under the pines with hectic flush and hacking cough that all too painfully made me realize that the mountain outing is not for my pleasure alone. Then we had two "schoolmarms"—one an invalid, the other the most absolutely helpless creature in camp that it has ever been my lot to meet. She could read poetry and rave over scenery, but she could not peel potatoes, kindle a fire nor make coffee. It was a relief to find that the other two young ladies had been raised on a ranch, and so far as camping and camp cookery were concerned were "up to snuff." So much for the personnel. In order to vary the monotony I persuaded my friend Leo B. to help me pitch camp and stay with us for a couple of days.

A 6 o'clock start and a 3 o'clock stop! Four o'clock found the two tents pitched beside an ice cold spring on Little Diamond; the stove set up in a natural bower; the teamster in the act of departing, while Leo and I ride with him as far as Big Diamond to try the evening fishing. Candor compels me to acknowledge that our first attempt resulted in a dismal failure. No matter what flies we tried they were eagerly grabbed by—shiners. Leo did succeed in securing a couple of 8in. trout, but what were they for such a crowd? However, we enjoyed an evening about the roaring camp-fire and determined to retrieve out fortunes on the morrow.

The shadows were yet long as we commenced to whip the stream that yesterday had doomed us to disappointment. The morning brought us no change of fortune. After we had fished for a mile up Big Diamond a man on horseback rode up to us. I had met him here during the two previous summers. He has camped on Diamond for thirteeen summers, and had never before had such a run of ill luck. He attributed the poor fishing to a saw mill at the head of the right-hand fork. The proprietor, in spite of a warning last year, persisted in dumping his sawdust into the creek. Leo and I determined to try the left-hand fork. For five miles we rode up the stream, through groves where beautiful summer camps were located. All the fishermen complained of existing conditions.

At the highest camp we tied our horses and started abruptly to the left on a narrow trail that led up, up, almost to the clouds. The torrent that roared beside us looked inviting, but when we tasted of the water there was a sulphurous flavor that hinted of proximity to Gehenna. After an hour's tramp the odor of sulphur filled the air, and we arrived at three large sulphur springs almost in the tiptop of the Wasatch. We had come to the dividing line between The Basin and Strawberry. Above the sulphur springs the valley opened into a great grassy flat, where the brook wandered now lazily in the open, now dashed into dark pools beneath the upland willow brush. There were no shiners here, just plain brook trout, and enough of them to make it interesting for three short hours, and then we wended our way downward with a full creel. How the other campers envied us, and how we exaggerated the perils of the trail, and how tired and hungry and self-satisfied we were when we returned to camp on Little Diamond at 10 o'clock in the evening, every one who has had a similar day's enjoyment well knows.

Leo departed the next day, and I was left as guardian of an overwhelming amount of femininity. I did not dare wander far from camp, but almost every evening I would walk down to Diamond and secure enough trout for breakfast.

Little Diamond did not yield one fish to my efforts. It was with a feeling of absolute [illegible] that I left my rod resting against the tent and my gun in its case and devoted the morning hours to the fauna of the up-country. Even though late in July, many species of birds were just nesting, and at dawn and vesper twilight the songs of thrushes and warblers blended with the music of the stream.

Close by our camp a dead willow bent over the stream. In its forks a thrush (resembling an olive-breasted thrush) had fashioned its delicate nest. What place could be more secure? A dense canopy of green from a stately box elder screened the home from preying hawks, owls and magpies; the nodding branch above the riffle rendered safe from hungry rodents and cunning snakes. Here the mother laid four beautifully speckled eggs. Day after day we would sit and watch her. At first she was worried at our presence, but after a while she became better acquainted and would allow us to approach within 5ft. of her. In fact, I think she rather expected a daily visit. Early one morning a fisherman passed by. He had worked hard for the two trout that were in his possession. I did not covet them. He had as much right to use birch pole and angle worms as I had to split-bamboo and grizzly-king. He came to the overhanging willow. It barred his way. The mother thrush flew up with a piteous little cry. That nest was safe from everything but man. He saw it[illegible] speckled eggs almost ready to burst with the pent-up life within; saw and for an instant the divine struggled with the brute; then with an oath he dashed the branch from his path. The nest tipped. On the rocks below four broken egg shells shimmered for a moment as the sunlight came through a fretwork of green, and then the silvery waters carried them away, and the recording angel jotted down one more tragedy.

Days rolled by. About our tents little pouched rats threw up their mounds, and as we caught them with simple nooses and fed them the weeds that they relished they became as tame as kittens. Even the squirrels lost all fear of us, and I have almost come to the conclusion that for the highest enjoyment in the woods rod and gun should be left at home. A week in camp and then a messenger with an imperative summons to another portion of the State. So ended the vacation of '98.

SHOSHONE.

PROVO, Utah, July 25.

Natural History.

Bird Nesting with a Camera.

PROVIDING there be water of some kind near at hand, the red-winged blackbird is not hard to please when he comes to select a nesting site. A tussock of grass in the middle of a swamp will answer his purpose very nicely, and he will build his nest in the center of it. A clump of reeds rising from the water of a pond will afford him an excellent site in which to swing his hammock, but a wild rose bush growing in the moist earth along the bank of a river will suit him just as well.

If I wish to photograph a red-wing's nest, it is to some such place as I have described that I take my camera.

NEST OF RED-WINGED BLACKBIRD.

Photo by Ernest Harold Baynes.

If I have any special reason for keeping my feet dry I wear rubber boots, as a good look at the home of this bird generally means more or less wading.

I was out on a little photographing expedition the other day, along the bank of the Noroton River, near Stamford, Conn. Just above the dam over which the river flows to join the waters of Long Island Sound there is a large pond, into which a long narrow promontory runs from the north. This neck of land is composed of soft, rich ground, and is covered with a heavy growth of bushes. Beneath them is a carpet of skunk cabbage and hellebore, and along the margin in the early spring there are brilliant patches of marsh marigold. It was to this place I came in search of the nest I wished to photograph. On the mainland, not far from the promontory, was a tall tree, and on the topmost twig a reg-winged blackbird swung in the wind. At short intervals he uttered a joyous call of "kong-quer-ree," which was doubtless a signal to his mate. The phrase is translated by Mr. F. M. Chapman as meaning "all's well." As I approached, his confident announcement was changed to a suspicious "chut, chuck," and then he launched himself into the air with a shrill and prolonged cry of alarm. As he did so his wings were spread, and he showed the brilliant crimson epaulettes from which he takes his name. Crossing over to the promontory, I pushed my way through the dense growth, pulling my camera and tripod along behind me.

I had not gone far when there was a flutter of bird's wings on my left, and the next moment the hen red-wing, a plain streaked bird, hung poised in the air above me. There, in a wild rose bush, and perhaps 4ft. from the ground, hung the nest, and in it were four beautiful blue eggs curiously streaked and spotted with black.

First of all I cut away with a jackknife several branches which overhung the nest, and let in a flood of sunlight. I then cut two long, straight poles and slung them up horizontally, a few inches apart, and almost directly over the nest. I made them as firm as I could by tying them to the bushes with cords, and by bracing them from below with stakes, which I cut with my knife. I placed the camera on the poles with the nozzle pointing down between them at the nest, and then made a trip to the mainland for a large flat stone. Fortunately there was an old decayed tree stump close to the rose bush, and by placing my stone upon it and climbing to the top I was in a position from which I could just manage to focus the camera. I was using a very slow plate, so I gave it a short time exposure with full sunlight, and obtained the picture from which was taken the illustration given herewith.

ERNEST HAROLD BAYNES.

The Great Carolina Wren.

(*T. ludovicianus.*)

THIS summer of 1898 has proven an unusual season in an ornithological way with me, inasmuch as I have chronicled the appearance of the European starling* here, and have renewed with much pleasure my old acquaintanceship with the Carolina wren.

I have at last succeeded in establishing a degree of intimacy with this bird that quite delights me.

We have had an unusual number of feathered friends with us this year, both local and transient, who have gladdened our few remaining woods and groves with song, and among them came this shy, alert, superb songster.

An occasional visitor, his advent in years gone by has always stirred me to unwonted effort in the endeavor to establish a familiar footing between us, but often as I have tried the result up to the present has been fruitless.

Some three weeks since I heard his unique call in the misty twilight of early dawn. The bird was far away, but his clear inimitable tones drifted to me through the open window like an elfin melody. A heavy, steamy fog shrouded the outside world, it was a silent dawn but for the soft purr of the dripping leaves; still nothing seemed to depress the cheery far-away little voice that weaved itself with my dreams.

A day or two of careful work convinced me that his favorite haunt was in the garden among the bean poles. And here, with opera glass in hand, I posted myself one morning about 11 o'clock to await his arrival. All the morning I had heard him on his range gradually working my way, but the supply of insects must have been abundant, for he was half an hour overdue.

I was on the watch for him, but even so he took me by surprise.

Mosquitoes were bleeding me most viciously as I stood among the vines, but realizing that the "flirt" of a handkerchief would put an end to my investigations, I had just taken the somewhat risky chance of lighting a cigar.

As I flipped the burned match away, there came the dart of a little body, a flutter of tiny wings, and within 8ft. of me, on a swaying tendril, set aswing by the impact of his tiny feet, was my rusty-coated little friend.

His eyes were upon me, and the quick, nervous flip of his expressive tail seemed to bode a sudden termination of the interview. Here was a fix! If I stopped smoking the mosquitoes would drive me out, if I continued the wren would be off to a certainty. However, I decided to chance it and puffed slowly on. For perhaps two minutes he eyed me, shifting his position up and down his tumbling perch, with sudden, jerky motions.

Presently he skipped to the tip of a pole some 2ft. nearer, again peering curiously down at me.

No need for my glass here, so save for an irregular puffing of my cigar I stood motionless.

Suddenly, to my great delight, he seemed to lose all sense of fear, and quickly fluffed himself into a little ball of ruddy, brown feathers, up went his graceful little head and that wondrous voice of his set me all aglow. The sting of mosquito bites vanished on the instant, and again after the lapse of years I felt that thrill that comes to all bird lovers in the fascination of their first ornithological studies.

I have toughened up somewhat during life, but for that moment I was a lad again.

God bless my little friend for it.

Oh, how he sang to me! I cannot describe it. For twenty years I had waited for this opportunity to listen and enjoy his musical ecstacy with him, but never before had he gratified my wish.

He made a lengthy toilet there on the tip of the pole, pausing every few moments to fling a ripple of song into the air, then in a flash he was in a nearby apple tree, poking about for insects. I saw him take a white moth from a crevice in the bark and next instant he had a small, green worm from the under side of a leaf, he clung vireo-like upside down as he ate it. Every second or two the old garden rang to the music of his call.

Something seemed to interest him in an old knothole he discovered, for again and again he would make a quick run along the limb and look in there, only to back away with a queer little chatter.

After a half-hour of restless fidgeting about, he seemed to have exhausted the subject of the apple tree and away he rippled to the woods close by. The soul of the garden seemed to go with him. Curious as to what could have attracted him in the knothole, I investigated and found a fat, comfortable looking old tree toad squatted blinking just inside the opening.

This bird is not a common visitor with us. I have seen perhaps a dozen in the last twenty years; never having found the nest, I cannot say they breed here.

Their usual call bears a striking resemblance to that of the Virginia cardinal, differing in that it is not quite so prolonged.

Extremely restless, continually on the move as it reaches for food, its action is much like that of the vireos in the curious positions it assumes.

All the individuals I have observed seem to have had

* See FOREST AND STREAM, July 30, 1898.

range which was daily traversed as long as they re-ained with us.

I have followed this particular fellow day after day er his so-called range, till, as I have related above, he last decided to reward my persistence with a song in s own charming manner.

You know "nothing is worth having that is not worth iving for." I have long and faithfully striven for just ch an intimacy with *T. ludovicianus* as the summer of 98 has given, and the result has repaid me a hundred ld.

I have but one regret, 'tis that I was alone, with no low enthusiast to enjoy with me the marvelous music the Carolina wren at close range.

WILMOT TOWNSEND.

AY RIDGE, N. Y., Aug. 1.

Some Animal Pets.—II.

I HAVE learned, as the result of long experience in weakness for domestic pets, that they will get cross they grow older, especially those redeemed from a ld state. As long as they are young they are amiable d interesting, but no amount of domesticating seems to event their gradually resuming all the characteristics their nature, which crop out by degrees until the time rives sooner or later when they become dangerous, children particularly, who are wont to tease them.

You would naturally suppose that the period for the ost prolonged amiability would be that of the deer stead of that of the bear, but such has not been my perience. The deer became dangerous at an earlier riod. They are lovely pets when young, and so con-ue for a year or eighteen months; after that they are t to be trusted; and strange to say the doe is the first become vicious. The bear, as we all know, is a play-fellow, and continues to be so for some time after he s obtained his growth, and does not exhibit dangerous alities to any extent; but the trouble with him is that gets so infernally rough in his play that one's clothes ffer, to say nothing of scratches more or less severe. e seems to have no judgment in the use of his claws, has a cat. I have had many a suit of clothes reduced a condition that the neediest tramp would reject, d yet bruin considered it all the height of fun. Dogs m dearly bought experience became shy of him, and clined a game of rough and tumble. The exception of imals disposed to develop into unamiable traits was little armadillo that I had caught when quite young. was a serious little fellow, and spent most of his time der the house, at least during the day. At night he uld come out and roam all over the house, dragging corrugated tail over the bare floor with a sound like agging a length of stove pipe. It was fun to see a g dash for him; his turtle-like shell, which, when one dertook to grab him, seemed a surprise to the dog; d the attack did not concern little piggy in the least. e seemed to be saying, "Go ahead, doggy, and try it if it amuses you," which it did not after a trial. gs would usually lie down and look at him, and no ubt were saying to themselves, "Well, what manner animal are you?"

As I say, he was a serious minded little chap, and at-nded strictly to his own business, which consisted rooting around the kitchen back door in quest of raps, and when the supply was short going into the chen and looking appealingly to the cook, who usually ve him a slice of bread, which he took in his mouth d carried under the house. He and the cook were eat friends.

There is one animal that I defy any human being to ne or get on friendly terms with, and that is the propriately named wildcat. A Mexican brought me kitten one day rolled up in a sack, exhibiting his nds bloody and covered with scratches. I had always ard that it was impossible to tame a wildcat, but I ought I would try the experiment, and placed him in wire cage. As small as he was, he would spit and owl if one came near him, and would not drink his lk if any one was present. As he grew up he seemed grow more devilish. I tried starving him, but it de no difference. I kept him for six months, by ich time he attained full size, and ferocity was no m for his devilishness. Finally one day, with the p of my Mexican boy, Santos, we dragged the cage ride the yard, and were debating whether to shoot n or take the cage down the river and throw him in. st then along came a neighbor who owned a big ll dog. "Hold on," said he, "let me go to the house d get Tige; it will be just fun for him."

said, "I hope you don't value the dog much."

"Value him? I have been offered $150 for him."

"Well," I said, "then don't turn him loose on this mint. If you do there will be a used up dog."

But he insisted on it. So Tige was brought, and was d to get at the cat. The man held the dog while I fastened the door. Out bounded the cat, and Tige nt for him. For about five minutes there was one nfused ball of dog and cat in the air, and yowls and owls. At last Tige got the cat at the back of the r: there was a crack and the cat was dead. But such looking dog as Tige was. He limped out of the ht covered with blood and scratches, one eye gone d a generally used up dog. I said, "How about that o? Sorry you did not take it?"

"No," replied the owner, "after that fight I would not e $200 for him."

Tige might have said with the Cave Roller:

> "Now the game is o'er and the coast is clear,
> Straighten up my nose and help me find my ear."

AN FRANCISCO.

Captive Albino Robin.

HIGHLAND PARK, Ill., Aug. 4.—From a robin's nest the porch of his house, a young friend secured an bino specimen which is now almost full grown and perfect plumage. It is snow white, with pink eyes. I ve seen albinos of other species, but never of a robin. is a rara avis. E. N.

Mink and Grouse.

MORRISTOWN, N. J.—*Editor Forest and Stream:* Your paper is received with pleasure at my house, and Mr. Mather's articles are read with pleasure and profit. I agree with him as to the destructiveness of the mink. What was said about minks in the issue of July 30 reminds me of the following incident: Together with my son I was following the track of a mink up a little brook, the ground being covered with snow, and came to where the track turned abruptly away from the stream and led to a brush heap about 25 or 30ft. distant. On the brush heap were scattered the feathers of a ruffed grouse. The track led back to the brook and on up. Evidently the mink had scented the grouse from the brookside, and must have been pretty hungry, as none of the flesh was left.

Game Bag and Gun.

Indian Modes of Hunting.

III.—Foxes.

THE fox as a rule is a most wily animal, and numerous are the stories of his cunning toward the Indian hunter with his steel traps.

Starvation makes them catch in deadfalls, but they must be very starved indeed before they pull a piece of frozen bait and have a weight fall on their back. The skins of foxes killed during starvation are never so valuable, as the hair then lacks the rich gloss. When small game is plenty, such as rabbits and partridges, and foxes are few, the skins are of a deep richness not seen under other circumstances.

There are several different and distinct colors of foxes of the north country. They are all of the same family, with the single exception of the white or arctic fox. These, apart from their difference of color, differ very much in their characteristics. They are not cunning; on the contrary, they are positively stupid. They will readily catch in deadfalls, and will walk into an open, uncovered steel trap in daylight! Again the flesh of the arctic fox is eaten as readily as that of the hare or white partridge; all other foxes are carrion; even a starving Indian would give them the go-by.

Of the other or true fox we have many colors and shades of color, and I give them in their cash value rotation, beginning with the black or pole fox: First, black or pole; second, black silver; third, silver gray; fourth, black cross; fifth, dark cross; sixth, ordinary cross; seventh, light cross; eighth, dark blue (i. e., lead color); ninth, light blue; tenth, bright red; eleventh, light red; twelfth, arctic white; thirteenth, pale red.

Number thirteen is the poorest quality of the fox family, and is worth less than the arctic white fox.

January is the best month for trapping. First, because the fur is then at its primest, and second, food is harder to get and the fox consequently more likely to enter a trap.

Of course any number of trap will catch a fox, but not every trap will hold him. There is such a thing as the trap being too large and strong, as well as too small and weak! When too large and strong it catches too high up the leg, and being too strong it breaks the bone at the same time; and then in cold weather it's only a question of a few minutes for the frozen skin and muscles of the leg to be twisted off and Master Fox runs away on three legs, ever after to be too cunning to be caught in a trap. On the other hand, if the trap is too small and weak it catches the fox by the toes, and he either pulls his foot clear at once or the toes, becoming frozen and insensible to feeling, are twisted off; and this, if anything, is a harder fox to circumvent than the one with half a leg.

The proper trap to use is a Newhouse No. 2. When properly set it catches just above all the fingers, as it were, or where the paw or foot would correspond with the thick part of the hand. There there is a good, solid hold of muscles, sinews, etc. There, once the jaws are fixed, they hold the fox to the death.

Fox hunters are very particular to keep everything connected with the trapping away from the house or camp, even wearing an outside pair of moccasins, which are peeled off and hung up with the snowshoes.

The hunter generally places his trap or traps on some bare point jutting out into the lake, or some narrows, or near a clump of willows at the edge of barren grounds, or any other place his judgment tells him a fox is likely to pass. The fewer signs the better; therefore instead of the chain being tied to a picket, a stick 4 or 5ft. long is slipped through the ring on the chain up to the middle. Here it is securely fastened, so that it won't slip either way. A trench the length of the stick is cut down in the snow with the head of the axe, and the pole laid therein about a foot beneath the surface. Snow is then piled in and the whole packed hard.

The trap is now opened, and the snow packed down with the back of the man's mitt, large enough to lay the trap and spring therein. The trap is now open and about 2in. lower than the surrounding snow. The hunter now begins carefully to lay five flat balsam bows or clusters of needles from the palate out to the jaws until the whole is covered; then very gently he either dusts light snow over this until it has the same appearance as the rest or he takes up two large pieces of frozen snow and rubs them together over the trap until all is covered.

Chopped up frozen meat or fish, a supply of which the trapper is provided with, is now sprinkled or thrown about, beginning 15 or 20ft. off and gradually getting more plentiful as the trap is neared.

With a brush broom the hunter dusts his snowshoe tracks full as he recedes from the trap until he is off 30 or 40ft.; after that no further precaution is necessary for an ordinary fox. But for an extraordinary one I could relate a hundred different ways of setting traps and bait to overreach the wily old fellow; but in most cases it is time wasted, the fox eating the bait and turning the traps over night after night, much to the vexation of the hunter.

It is a pretty sight to see a black or silver gray fox jumping in a trap on the pure white snow. I went one time with Wa-sa-Kejic to see his traps in the barren grounds back of the post. I was following in his snowshoe tracks steadily, and we were just topping a small swell in the country, here and there clumps of black willows. All at once he stopped so suddenly in his tracks that I fell up against him.

"There," he said, "look at that!" My eye followed his finger, and there, jumping and struggling to get away, was a large black fox!

"Let me shoot him," I exclaimed, drawing my gun cover as I spoke.

"Oh, no," he replied, "we will only do that if he pulls himself clear of the trap." And with that he drew his belt axe and walked with a steady step down on the fox. The closer he got the more the fox struggled, but he was well and freshly caught, and the trap held him fast.

Wa-sa-Kejic gave him a tap on the nose with the helve of the axe, which had the effect of stunning him. The Indian then seized him with his left hand by the throat, and with his right hand felt for his heart; this he drew gradually down toward the stomach until the heart strings gave way; there was a quiver, and the fox was thrown down on the snow limp and dead.

What a pleased look the Indian wore as he stood there, evidently oblivious to my presence for the moment, as he gazed down on the most valuable skin it was possible for him to trap. What a number of necessaries and luxuries this would procure for his family. He would get from the factor at the post $80 for that one single skin! What a number of any other skins it would take to amount to that sum!

MARTIN HUNTER.

Woodcock and Plover.

ONE sultry afternoon the last day of July, 189-, a gunning skiff rowed out from the Pennsylvania shore of the broad Delaware, with three men and a veritable boat load of miscellaneous articles. They had not far to go, for their objective point was a graceful little sloop yacht lying about 200yds. out in the stream, and glad were the occupants of the skiff that the distance was no greater, for they were anything but comfortable amid the confusion of guns, bags, boxes, baskets of fruit, and a big chunk of ice amidships wrapped in blankets and newspapers.

On the last seat sat the rower, there being no other seat available. He was a typical Delaware River man—fisherman and gunner—employed to take charge of the yacht Signet, to which our party were rowing. Of medium height and size, wiry and bronzed by continued life on the river, such is a brief description of Carmen, one of the best shots, undoubtedly the best plover hunter in the country, and considered by his present employers an invaluable assistant in the field, and the best of company on a yacht.

On the extreme stern of the skiff, with one leg along the gunwale and the other stuck out over the baggage, was Bill, the youngest of the party. He was one of those overgrown boys that are sometimes termed all legs, and his were certainly long as well as remarkably thin, albeit straight, and as had been shown on many a shooting trip, strong and tough enough to carry their owner as far as the next man. Bill was an enthusiastic sportsman, a hard worker, a tolerable shot, and was not easily discouraged, but always extremely elated over any success, no matter how small.

At the bow was the Colonel, a man of medium size and some ten years older than Bill. He was the best hunter, the best shot, and the life of the party; in fact, most every time he spoke the others had to smile, and when he told one of his famous stories after supper Bill would almost go into hysterics, while Carmen would chuckle to himself at intervals for an hour afterward.

The only other occupant of the boat was Ready, Bill's Irish setter, of whom we will have more to say later.

By the time Carmen had melted an indentation in his icy seat, the skiff had reached the yacht, so our sportsmen jumped, and while Carmen put the things aboard they went below to change their city clothes for something cooler and more appropriate for shooting.

By the time they got under way the sun was scarcely two hours from the horizon, and as the wind was very light they calculated by the time they reached the mouth of Sculltown Creek on the Jersey shore there would be little more than an hour of daylight remaining in which to shoot. In addition to this it was apparent that on the high water they would have a thunderstorm; and so it proved, for hardly had they come to anchor in the creek before the wind came out in puffs from the northwest, and the heavy clouds above them burst with all the fury of an August thunder gust.

But the rain made no difference to either the Colonel or Bill; in fact, the change in the weather made it more pleasant for their work. As the time was short, leaving Carmen to prepare supper, they jumped in the skiff, called Ready after them, and rowed up the creek a quarter of a mile to the end of a row of willows which grew at the end of the fast land, and between it and the marsh along the river.

Here was what is termed a rift, which is the collection of driftwood and debris left by the tide at high water. This rift was in some places right under the willows, in others 20yds. further out toward the river, and on both sides was it hemmed in by cat-tails and reeds. In dry season the woodcock, not finding the woods sufficiently moist, come down to such places as this, where the high tides keep the ground damp and succulent, and here they are often shot in considerable numbers, there being but a limited amount of space to hunt over, as the rift is seldom 10yds. wide, and the birds come out of the cat-tails and from under the willows at night to feed on the more open ground.

The evening of which we now speak was particularly favorable, for the reason the tide, now high, would drive in any birds there might be on the marsh outside the rift, while the thunderstorm had made it appear as if the sun had set already, thereby having a tendency to bring the birds out from under the willows at an earlier hour than usual; and so it was that our sportsmen started up

the rift with high hopes and in the best of spirits, in spite of the drenching rain.

Nor were their expectations doomed to disappointment, for they had not gone 20yds. before Ready, who was beating the cat-tails between them and the willows, flushed a bird, which flew out toward the Colonel with that most thrilling whistle that makes one's blood rush through his veins with renewed vigor; and now as the bird turns up the rift the report of the Colonel's gun announces his death, and a bunch of brown feathers floating in the air shows where the noble bird lies.

Bill now takes a turn toward the willows, thinking perhaps another bird may be skulking beneath their shade, and sure enough as he stoops to get under a low-hanging limb a bird rises from under his foot almost, but poor Bill just now is on his hands and knees, and before he can get his gun up the bird is out of sight behind another tree, so our young hunter talks to himself in a most emphatic way about the hard luck of a woodcock getting up when he is crawling under a limb, etc., and makes up for his misfortunte by cutting down another soon afterward which offered a fairer shot.

Soon, however, daylight began to leave them, but before they stopped shooting they had picked up eight good birds and missed several more in the gathering darkness, until they knew Carmen would have a good supper waiting for them.

With a change of dry clothes on, an hour later they were very comfortable in the snug little cabin, with the table full of good things in front of them, and the rain falling on the roof above, making it seem all the more cheerful inside.

Two woodcock apiece, with a dish full of fresh sweet corn on the ear, and some fried sweet potatoes, composed the bulk of the meal, which was added to by a big bowl of claret punch, brewed by the Colonel. While for dessert they each reveled in a heaping saucer of peaches and cream, and last, but by no means least, the Colonel handed around his cigars he had brought from New Orleans, and which were simply superb, and with these to smoke the evening indeed passed swiftly and pleasantly until some one noticed that the hour was late, and they remembered they were to rise with the sun the next day, and so retired to dream of the wily plover.

When the alarm went off at 4:30 o'clock it seemed to Bill a terrible hardship to leave the comfortable bunk, but finally with many yawns and stretches he dressed himself and went on deck, where he found the Colonel and Carmen discussing the best way to hunt.

The upland or grass plover are among the most shy of birds, and at the same time most stupid, for while they will often rise before the sportsman can come within 200yds., provided they see him, on the other hand they will allow him if concealed from their sight to shoot many times in succession before they will fly away, and will also come readily to the whistle of the hidden or even motionless hunter, provided he is expert in imitating their peculiar and plaintive note, which can be heard on a quiet morning or a calm night several miles away.

Even as our sportsmen were arguing the best course to take they were startled by a shrill familiar whistle, which made them rush for their guns, but by the time they could load it was too late to shoot at a bunch of seven that had darted over the creek within 60yds. of the yacht and lit in the meadow a quarter of a mile beyond.

This, however, decided their plan of attack, for they concluded to try to get a shot at those birds first, and then go on up through the pasture fields.

"And now for breakfast," remarked Bill, who always was ready to eat, as he led the way to the cabin and pitched into some ham and eggs and a big cup of good strong coffee Carmen had all ready for them.

This time Ready was the only one to be left behind, as Carmen was too valuable an aid in the field to leave on the yacht, while the dog would have been in the way and of no use anyhow.

Putting the skiff in a little sluice in the bank of the creek, and tying her there, our sportsmen crawled carefully up the bank and looked over, knowing that if any plover were there they would at once fly off if they saw them; and well it was they had taken this care, for about 100yds. out in the field were not less than a dozen birds running around and feeding, but occasionally lifting their heads high above the grass, looking for danger, for all the world like diminutive wild turkeys except in color.

The field in which they were was a large one, with ditches on three sides, and the bank on the fourth, while the birds were just about in the middle. The only way to get at them was for one to crawl along the ground after the others had taken positions surrounding the birds as much as possible. Consequently Bill ran down behind the creek bank until he had reached the other side of the ditch dividing the field from the next one, and sneaked along behind the cover of the reeds growing in the ditch, and so around the field until he reached the opposite side from where he had started, and where the Colonel had remained hidden behind the bank.

In the meantime Carmen had gone around to the other side of the field, and when he saw the others had taken their positions he started to crawl slowly toward the birds, keeping as low down as possible and dragging his gun behind him. Finally he managed to get within 60yds. of the nearest bird, and taking aim he knocked him over with his first barrel. At once the other birds saw him in his raised position, and up they jumped, but before they could get away his second barrel crippled another.

The rest of the flock fortunately flew in Bill's direction, and came near enough for him to kill two with his first barrel and another with his second.

Carmen, not seeing any more birds in the field, jumped up to get his crippled bird, which was fluttering around and likely to get away, when to his surprise he flushed another pair nearer the bank, which flew past the Colonel at full 70yds. distance. By good fortune, however, at the report of his gun one was wing-tipped and fell in the creek, where he had little trouble in getting him. Quite encouraged, our friends now walked on up the meadows, keeping about 300yds. apart, and the one in the middle about 100yds. behind. In this way any bird getting up was likely to give one of them a shot, for as soon as the well-known whistle was heard, which is often the case before the bird is seen, they knew a plover had got up, and each would get down as low as possible and try to whistle the game in his direction. By so doing they had picked up several birds, one at a time, but were not finding any large flocks, and they were becoming tired and discouraged.

Therefore after a consultation it was decided to turn back toward the yacht, now some four miles distant, and try the meadows further back in the country.

After walking a mile without seeing a plover, Bill, who was on the end of the line, saw a bunch of fifteen or twenty light in a field where there were ten or twelve small hay mows, left there by the farmer probably, to be gathered in his wagon. This was very fortunate, for they afforded good hiding for our sportsmen, and therefore provided a good chance of securing several birds.

The Colonel and Carmen each took a side of the field, and succeeded in crawling in and hiding themselves each in a pile of hay, while to Bill was left the task of crawling on the flock. The birds were not within shooting distance of any of the hay stacks, so it was no easy matter; but there was one chance, which, if practicable, was likely to prove successful.

The birds were feeding within 20yds. of the ditch dividing the field, but as the water was high and there happened to be no reeds in this particular ditch there was nothing left to do but get in the ditch and keep well down in the water. This Bill decided to do, but it was slow work. The bottom was very muddy and of uneven depths. Occasionally he would tread in a musk-rat hole that would nearly cause him to swim, but by careful, hard and cold work, just keeping his head and his gun above the water, he at last came opposite the birds, which were entirely unaware of his presence.

Picking out a small bush on the bank, he carefully crawled to it, and slowly pushed his gun barrel through. The plover were feeding not 30yds. away, and he counted sixteen birds, nearly all within range. Getting two in line, he let one barrel go and remained perfectly still. Two of them fell dead and the others stopped feeding, but didn't get up, not seeing anything to alarm them. Carefully slipping in another cartridge, he killed two more without changing his position.

The birds were getting uneasy, some running around and flapping their wings. Again the fatal shot killed a pair of the closest birds, and the rest could not stand it any longer, and up they got, badly scared, but not before Bill cut down another—his seventh bird: The other nine flew straight for the Colonel's blind and not over 10yds. high. He waited until they passed all bunched up and then killed four with his two barrels. This ended the shooting for that day. Birds enough had been killed, for there were twenty-one plover brought back to the yacht. Six were cooked for dinner and fifteen plover—a pair of cocks—were taken home.

NORMAN PRENTICE.

PENNSYLVANIA.

A Winter Trip in the Rockies.

I WILL give a brief account of the winter trapping expedition which followed our fall expedition, as related in the July 23 number of FOREST AND STREAM. It was entirely novel to us, and was more for experiment and information than for profit. It had long been a question in our minds whether the fur animals migrated as did the big game, at the arrival of the deep snows; this, along with other things, which we wished to learn by observation, led us to plan the trip.

We had always been accustomed to using the long Norwegian snowshoes in that locality, but we at once agreed that for pulling a trail sled we must have web-shoes. Then came the question of trail sleds. These we made after our own ideas: about 20in. wide, 6ft. long, with runners 4in. wide. We couldn't agree as to the kind of soles for the runners; we therefore each had our own way. I burnt mine over a slow fire, rubbing tallow on them until they were a dark brown color, the same as we prepared the soles of our Norwegian snowshoes. Bert tacked tin on the soles of his, as being his idea of the best way, thereby giving a chance for experiment. The result was not very decided. During certain conditions of the snow mine would run with greater ease than his; while with other conditions of the snow, caused of course by temperature, his would run easier. Then we disagreed about putting tongues in our sleds, I put a good, strong tongue in mine; he wouldn't have one in his; the result was the first steep mountain side we undertook to go down we had to take an hour off and, with a limited kit of tools, put one in his to keep it from running over everything in sight. Not knowing how far we might go, or how long we would want to stay, we took provisions to last us six weeks, with what meat we would get. Bert took a rifle and I took a .45 cal. revolver. Our outfit consisted of about 160lbs. each.

The night before we started a light snow fell to a depth of 10in. Any one who has traveled on snowshoes knows what that meant for us. At every step we would sink about the depth of the fresh snow. We both took our first lessons on web-shoes the evening before we started, and felt handicapped, but started out boldly on a Monday morning in January. With our disadvantages we could only go a few rods at a time. Night came on, and after a very hard day's work we were about one and a half miles from home. We went back to spend the night at home rather than to make camp, as it was easy traveling in our beaten trail. The next morning we cached half of our loads at the place of starting and made better time, getting about three miles further. Then began our first experience in camping in deep snow. We shoveled down through 4ft. of solid, hard snow a hole 7×12ft. for our 7×9 tent, allowing 3ft. in front for a camp-fire.

The next day we went back and brought up the remainder of our outfit, and left it packed on our sleds, and the next day we took the same loads several miles further on, cached them and returned to camp at dark. The next morning we broke camp, and moved three miles beyond our last cache, and after shoveling down through 7ft. of snow we found what we were hunting for—bare ground—but unfortunately we came down on top of some old logs, which made an inconvenient camp. The next day, in a continuous snowstorm, we went back for our cached supplies, and by night were again in camp with our entire outfit, and felt ready to take a breathing spell and look around us.

It had been dawning upon us before this time that fur animals were scarce, compared with what they had been in the early fall preceding. We went out and set a few traps, but were not encouraged to put out many. The first morning we took one marten, and as there were very few tracks, we moved camp four miles further, and there began hostilities against a few foxes and lynx, which we found to be in the vicinity.

This was the nearest point to the first cache of meat we had made in the fall. Taking a trail sled we went for a load of meat to the spot where we had cached it up in the top of a hollow stump about 8ft. above ground, thinking it would be safe from all animals not having "climbers" on at least. Finding the spot as nearly as we could tell by the lay of the ground, we found only a smooth, white surface of snow, unbroken by any old stumps or any mark of any kind as a guide. This was on top of a very high mountain where the snow had drifted some.

Seeing a marten track we followed it a few yards and found where it went under the snow. Taking off one of my snowshoes to use as a shovel, I dug down about 3ft., and struck the top of the old stump, and in it were the bare bones of the meat we had so carefully put "up" out of reach of the larger animals.

Nobody knows how funny I felt when I discovered that I was walking around at least 11ft. above terra firma. Of course we were disappointed, and the inward craving for elk meat became stronger as soon as we found we were destined to go without it; and we unanimously agreed that we would have to depend upon snowshoe rabbits and grouse for meat. We started back to camp, and as we were on top of a very steep and high mountain, the down-grade toward camp extending full a mile, I suggested that we get on the sled and ride down, as there was only a scattered and scrubby growth of timber. Bert said walking was good enough for him, but I thought riding was preferable, so I tied my snowshoes on the sled and started. I didn't time myself by the watch, but am certain that in two minutes I was at the foot of the mountain. Such a ride. I never claimed that I thoroughly enjoyed it, not so much as it had lasted longer, but there was no disputing that I got into camp away ahead of Bert, and of course I told him I had had a good ride.

We spent a couple of days there, but found no martens and the foxes and lynx would not do as we planned they should do. Having investigated a few miles further on and finding some marten tracks, we agreed to move camp again. The morning we were to break camp, Bert went out a short distance to get a trap which he had set for lynx, and soon came back with a wolverine or carcajou, which was in his trap. (Will FOREST AND STREAM give correct name?) It was a fine specimen of this rare animal; not very large, but the darkest we had ever seen; the prevailing color of it being seal brown and black. They are rarely found in that locality, and we were doubly glad to get it, as a sportsman from Illinois, whom Bert had guided on a hunting trip the preceding fall, had left special orders to try to get him one.

The next camp ground was on the bank of the Grand Encampment Creek three miles below its source; there we shoveled down through 8ft. of solid, hard snow, in the heavy timber where there was no drifting. This was one of the facts we were wishing to learn, as different persons had different information to give as to the depth of snow in the mountains. The snowfall of that winter we think was about an average, and at that season of the year it should be at its greatest depth.

It was a unique looking camp. The snow being soft we shoveled steps to go down into the tent; the tent could not be seen until one would go up to the edge of the hole and look down, as the snow was far above the top of the tent. We got our wood by chopping down trees, cutting them into lengths, and carrying them down into our den, which required no small amount of labor as it was extremely cold. One night in particular we were obliged to keep up a fire all night to save ourselves from freezing. We learned, after going home, it had been from 40 to 50 degrees below zero that night. The thermometer was scarcely ever above zero during our trip.

There was only one camping place in our trip where we had to melt snow to get water. There were water holes open every few rods all along the streams, whether the streams were large or small. The snow would be level on top, with scarcely any depression to indicate where the streams were. The open holes were generally small, with the side walls of snow, perpendicular, and generally 12 to 15ft. from top of the snow to the water.

Sometimes we would shovel steps down to get to the water, but generally would cut a long pole, leaving a hook on the end, hang our pail on the hook and let it down, and

"Dripping with coolness it rose from the well."

We took but one marten while in this camp, and we agreed thereafter to uphold the idea that the marten at least migrated to some extent in the late fall, and presumably follows the big game.

We were able to get all the meat we could eat by killing snowshoe rabbits and grouse, which were in surprisingly good condition, and as palatable as one could wish. I enjoyed it specially for the revolver practice in shooting rabbits, which were plentiful, but quite wild, seldom offering a shot while sitting.

After all our moving about we were only about fourteen miles from the ranch. After spending two weeks in camp, and having no success, we broke camp and moved four miles nearer home, camped over night and agreed to go the remaining ten miles the next day, even though we had to leave our sleds on the way and go back after them. We ate our breakfast at the first dawn of day, and started on a trip that will be hard to forget. Most of the distance was down grade, but we were obliged to follow a stream which led us through the roughest country that it was possible to find. By continuous hard tramping and pulling, upsetting our sleds many times, and suffering other grievances, we pu

our sleds up to the door of my cabin just at dark, so tired nd worn out that I think we felt in our own minds hat only fools would undertake such a trip. However, feel gratified now that we made the trip, and saw the Rockies wrapt in their winter mantle, which to me was urious and interesting.

Since then we have ridden past some of our camp grounds on bare ground, and sitting on an ordinary sadle horse we could, by reaching up, just lay our hand n top of the stumps of the trees we cut for wood. They re a source of wonder to people finding them, and not nowing how they were cut.

We found grouse to be very wild and harder to approach than on bare ground, which is doubtless due to heir being hunted harder by animals.

EMERSON CARNEY.

MORGANTOWN, W. Va.

New Brunswick Notes.

THE salmon fishing season in this Province, which will close on the 15th inst., has been above the average of former years in regard to the supply of fish. While he catch on the Restigouche has been relatively small, shermen on the Nepisiguit, Northwest and Southwest Miramichi, and Dungarvon, have had excellent luck. A eculiar feature of the fishing on the Southwest for the ast four years has been the almost total absence of adult almon, whereas grilse, averaging about 4lbs. in weight, ave been quite plentiful. Last year was an "off" season o far as this river is concerned, owing to an immense am of logs which filled the stream for miles and stopped he fish from getting up. Mr. Edgar Hanson, of Fredricton, returned from Boiestown the other day after a wo weeks' trip. He brought home about fifty grilse, but o large salmon, and saw very few of the latter in the ools. On the Dungarvon, however, a tributary of the outhwest, a party from Fredericton, consisting of Dr. Coulthard, James S. Neill, Joseph Walker and Dow immons, brought home about thirty salmon, of which en were adult fish. They also bagged a large number of rout running from 2 to 4lbs. in weight.

Tourist travel has been very light in New Brunswick his summer, owing doubtless to the war. But there will e no falling off in the attendance of sportsmen when the ig game season sets in. I have up to date personally ocated about forty parties in different sections of the Province. The fine display made by New Brunswick t the Sportsmen's Exhibition last March, and the almost uniform success attained by our American friends who came here last fall, are having the effect of bringng in many hunters who never tried this Province beore. Owing to the improved methods of protection now ursued by the Government, under the able management f Surveyor-General Dunn, the supply of moose and deer s certainly on the increase. Caribou, which are becomng so rare in Maine, are probably not more than holding heir own in this Province. Some of the guides say hat the decline of the caribou is owing to some kind of nsect that preys upon them. The caribou has not the ame fondness for water as the moose, and hence is greatly afflicted with insectivorous pests in warm weather.

The lakes at the head of Tobique will be visited by many visiting sportsmen this fall. One of the guides in hat region, Adam Moore, of Scotch Lake, while erecting camps there in July saw forty-eight moose and ten deer. He states that twelve of the moose were adult bulls. Plenty of bear and caribou "sign" were noted, but none of the animals were actually seen. A Boston sportsman returned the other day from a trip of an unusual sort with the veteran guide, Henry Braithwaite. He accompanied the latter for several weeks in his bear trapping operations. Henry caught eight bears. The Boston man enjoyed the experience immensely. He said he preferred a trapped bear to a loose one.

Nine out of every ten sportsmen inquiring about New Brunswick want to come in September. This makes it hard for all of them to secure good guides. Very few seem to care for snow hunting in November and December, which is by far the surest way to get a moose.

FRANK H. RISTEEN.

FREDERICTON, N. B., Aug. 4.

From Currituck.

CURRITUCK, Aug. 1.—The bay bird shooting for the last half of July has been excellent. Mr. L. L. Lorrilord, of New York, spent the last ten days at L. R. White's place; he bagged 800, mostly yellowlegs and dowitchers. It has been an easy task to kill 100 birds to the gun in a few hours any day. Messrs. L. Overton and J. L. Turner, of Coin Jock, killed two very large black bears on Thursday of last week; the bears came up to the house and each took a hog weighing about 100lbs. and started back to the woods for their feast, but were overtaken and killed with bullets fired from ordinary shotguns.

Mr. Bob Flora, of Shawboro, also killed a bear in a very novel manner. He used buckshot in the first barrel, which did not go through the skin, but dropped him dead with a charge of No. 8 shot with the second barrel. This was done by cutting the cartridge in half between the two wads which covered the powder. It was a hard story to believe until I saw him fire a load through an inch board at 60yds. This is worth knowing, for one never knows when he may run across a bear or deer while hunting quail near the swamps anywhere in the South.

Although we have hunted in this section for the past thirty years, we never knew that rail, or sora, as they are called in Virginia, raised their young in Currituck until this summer, but we have seen them at all ages and in large quantities during June and July. We also saw fifty young black ducks one day last week, which is more than we ever saw before. MORE ANON.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

CHICAGO AND THE WEST.

The Prairie Chickens of the West.

CHICAGO, Ill., Aug. 6.—Optimism is not in order in dealing with the prairie chicken question of to-day, however desirable it may be as a general thing in human affairs. The time was when, as the chicken season drew near, friends might say to each other joyfully: "Let us take our guns and dogs and go out for a pleasant and sociable shoot." In those days it was not a question of a scramble, but the shooters who planned for a few days of sport might be sure that they would not be disappointed. It was not a question in those days of early or illegal shooting, for the birds were so abundant that the illegal demands did not lessen the supply beyond the requirements of sport, although the common law of the shooters ran to the effect that birds might be killed as soon as they were half or two-thirds grown. The results of those easy, fatal days of certainty and abundance are known in the history of sport in this country.

To-day all this is changed. Shooters cannot say to each other, "Let us celebrate opening day with a little assembly of our own." There is no certainty that any place can be found where the shooting will be good on the opening day of the season. It is to-day not a question of choosing a place, but of searching out a place. The illegal shooting outweighs the legal shooting, and those sportsmen who wish to observe the law have first of all to consider the results of shooting which begins a month or two months before the legal season opens. That optimism which sees in the fact that we still have prairie chickens in the West any augury of the fact that the supply will ever again be anything like sufficient to supply the demand is too credulous to claim respect. We have too many guns in the country now, and these guns are in part owned by too many greedy and unreasoning men to permit us ever again to look for the pleasant little chicken party where the shooters might sally forth confident that they would get their game. In some localities the law has been and will be enforced, but usually the law has been best enforced where the birds were scarcest. Some few favored sportsmen will have good shooting on the first week of the opening season in this State and other Western States, but for one party which goes out and returns successful there will be a score of parties who will come back disappointed of even reasonable results.

These statements I take to be facts, based upon considerable experience and a wide inquiry. That they are unfortunately true I believe to be attributable to that selfishness of human nature which still hangs on to the old common law of killing a chicken as soon as it can fly. Out in the West a couple of decades ago, if we were driving along the road across the prairie, with no gun in the wagon, and if we saw a flock of young chickens fly up and light again in the grass, it was not uncommon to go after them and secure a mess for supper by no better means than the lash of a long wagon whip. The young and tender bird, fluttering up out of the grass, was so dull of flight that the lash of the whip brought down straight on its line of flight would very often cut it down with broken neck or wing. There was no law forbidding the killing of these birds at any time, because it seemed they could never be appreciably diminished in their numbers by any means whatever.

The years have passed since then, and with them have changed many things. But that same helplessness of the young prairie chicken in July and August still remains unimproved in the way of nature. The thoughtlessness of human nature still remains in many cases also unchanged. Regardless of the law, regardless of the changed conditions, there are still a great many men in this country who will take their guns and begin cutting down the young prairie chickens from the time they are able to top the grass in their feeble efforts to fly. I do not hesitate to say that if a decent chicken date could be set for the Western country, and if that date should be absolutely respected, we should still have left in this country plenty of shooting on these birds, not only for the hogs, but for the gentlemen of the land. It is to-day a question of illegal shooting, and not a question of the natural supply. When we were boys in school we decried that spirit of cowardice which took advantage of odds. As boys we were sportsmen. We said, "Two on one ain't fair!" The thousand-to-one odds against the prairie chicken are not fair. Give it a chance and it will take care of itself, as will a boy, or as will any other animal. This bird has not had its chance.

In Illinois.

In the State of Illinois we have the curse of sooner shooting, though there are still prairie chickens and possibilities of prairie chickens in considerable numbers in different sections of the State. There was one Illinois judge, Judge Ramsey, of Whiteside county, who did more last year to injure the prairie chicken in Illinois than can be done for its benefit in the next ten years. This judge had a criminal case before him under the chicken law, and decided that the law was unconstitutional, and that shooters might begin killing prairie chickens on Aug. 15 instead of Sept. 15. This sort of law pleased hundreds of shooters in this State, and the effect of this decision is still distinctly noticeable to-day. For instance, I have before me a letter on this head, a sample of many which have been received at this office, and the like of which Warden Loveday tells me have come into his office in very great numbers. This letter reads:

"Fulton, Ill., Aug. 5.—As some parties here tell me they intend to go out and shoot prairie chickens on the 15th of the present month, on the decision of Judge Ramsey, of this county, given last fall, will you please tell me if that decision was upheld or reversed by a higher court. D. N. Allison."

Of course, the answer to this letter is that the chicken date in Illinois is Sept. 15, in spite of Judge Ramsey, who has not yet the honor to be the whole Supreme Court of Illinois. The case brought before him was a criminal case, and hence no appeal could be taken from it. But as I have earlier stated, Warden Loveday will prosecute all cases where persons are discovered shooting before Sept. 15. I would advise all sooners to respect this latter legal date, else they may learn a thing or two about the wrinkles of the law which shall not prove to their liking. Warden Loveday will this season prosecute not with criminal cases, but with civil cases, bringing an action for debt in the name of the State of Illinois. Thus, if a man has any property, he may find his sooner shooting a direct tax on this property. Where a man has no property, he will be prosecuted criminally, and the warden will take his chances, on the basis that there may be judges in this State who do not quite agree with Judge Ramsey. It will therefore be wisest to wait till Sept. 15.

The Law and the Land.

I have talked with Warden Loveday to-day about the chicken prospects, more especially in regard to the early illegal shotoing. He is just back from a week's trip out in the State. He says that at Galesburg there is a very bad state of affairs. Shooting chickens has already begun, and many of the best men, leading business men of the town, are going out right along after the birds. At Bloomington affairs are a little better. There is a new club there, which has raised some money, and asked for an outside deputy, not trusting to the services of any local man. At Pontiac the law is better observed this year than it was last. At Mendota matters are very bad, and there is a great deal of open defiance of the law. At Minonk matters are equally bad, and also at Assumption. A great many complaints of sooner shooting came from Pekin. At Champaign the sooners have been at work two weeks. At Anawa the illegal shooting has been very pronounced. At Beardstown there is a very nest of illegal shooters, and at Kinderhook matters are about equally bad. The shooters of Keithsburg, Ill., are many of them already going out after prairie chickens. In Kane county the law has been well observed. At Macomb the better class of shooters has prevailed and the law has had fair observance. An amusing letter from one of Warden Loveday's deputies came in to-day. The latter says to his superior officer that if he can get the "sports" to hold off till Sept. 15 he will not begin shooting himself. "But if they are a-goin' to shoot Aug. 15, I feel as if I had ought to shoot too," he says. This naïve confession may have done good to the soul of that deputy, and it shows very clearly the mental attitude of all too many shooters.

Mr. Loveday tells me that in the low country of the State the birds were drowned out last spring by early rains. Some of them nested again, and these late coveys are not any bigger than quails at this date.

So far as he is able to determine, Warden Loveday thinks very few illegal chickens are coming into Chicago market. He has seized only five illegal birds. Young prairie chickens are worth $9 a dozen on the market here, but are hard to get. The demand for them, from clubs, etc., is very strong.

Warden Loveday is planning an extensive campaign against the illegal prairie chicken shooters of this State. He will need to send out deputies, lawyers, witnesses, etc. It costs money to go to law, and Mr. Loveday wants more money. Hearing that the Illinois State Sportsmen's Association has a certain amount of money set apart for the purposes of game protection, Mr. Loveday is writing to the president of that Association, asking help for his summer campaign against the sooner shooters. There is a chance here for the sportsmen to do some good. A glance over the list of towns above mentioned will discover the fact that some of the places where illegal shooting is going on are towns where clubs of sportsmen are organized which send delegates to the State Association. If the latter can help the warden it will be helping the better element of sportsmanship in these towns.

In Texas.

Chicken shooting began in the State of Texas on Aug. 1, and reports from that State are on the whole not very roseate. It is stated that the birds have been pretty well shot out in some parts of the country, and that in other parts a great many ranches have been posted. Of course, for a State so large as Texas it is absurd to make any general statement. The above reference comes more especially from the section about Houston, which was once a very good chicken country. The new law of Texas, forbidding the shipment of chickens from the county in which they are shot, will receive its first serious test this summer, and by some it is considered not an unmixed benefit.

In Oregon.

The sooner is abroad in the State of Oregon, and reports come from the neighborhood of Portland that a little hustling would uncover a lot of illegal shooting. In the Willamette Valley grouse, quail and pheasants are all a good crop, and if the shooters will hold off until Sept. 1 they can all have sport. The State of Washington opens its season two weeks earlier, and many Oregon shooters go across the line.

In North Dakota.

Advice from Forman, N. D., states that chickens were never more abundant than they were this summer, that the law has been well observed, and the prospects for opening day, Aug. 20, are very good indeed.

In South Dakota.

In South Dakota the chicken season opens Sept. 1. A report from Mitchell, S. D., states that the sooners have been at work for over two weeks. This week Warden W. B. Dodson succeeded in arresting Thomas Fullerton, Peter Burns, Dick Smith and Ted Wedehose, who all pleaded guilty and paid $10 apiece for the birds they had killed. This has rather cast a gloom on the sooners around Mitchell, and I shouldn't wonder if they thought the law was unconstitutional.

In Wisconsin.

The State of Wisconsin is not by any means to be sneezed at as a prairie chicken country. The law opens there on Sept. 1, but, of course, the sooners cannot wait. In the neighborhood of Ipswich the shooters have paid no attention to the law. The wardens made a raid and

captured several men. Further raids will be made, and whatever may be the crop of prairie chickens in that vicinity, there seems to be no doubt whatever about the crop of sooners.

Ohio Warden Law Unconstitutional.

A large and gaping hole, through which any gentleman may toss a dog or drive a coach and four, seems suddenly to have opened in the game law of Ohio. The law has been discovered to be unconstitutional in regard to a certain clause, and inasmuch as this clause happens to be that governing the appointment of the fish and game wardens in the various counties, it would appear that the question of game protection in that State is in a very simple condition, in which the man with the longest legs has the best chance.

It all happened over a squirrel which William Walker killed on Aug. 30, 1897, just one day before the law was up. He was fined, and he went to jail, and the costs ran up to $122.24. The auditor of Delaware county refused to pay these costs. Then came the lawyers, and just to relieve the situation Judge Wickham decided the law was unconstitutional, which seems to have pleased everybody all round, except those who think that nowadays a State should have game wardens and game protection.

The point of the decision was this: "The court holds that Section 409, O. L., providing for the appointment of fish and game warden, is unconstitutional in that it provides for the creating of a county officer otherwise than by election, as provided by the constitution of Ohio."

E. Hough.

1200 Boyce Building, Chicago, Ill.

Only One Way to Trap Coons.

"If any one ever told you he trapped a coon in the woods, he told you what never happened," said a Pohcuck coon hunter. "Coons can't be trapped except in one way, and I never found a coon hunter yet who knew how it was done. You may track a coon to his home in some crevice of a rock, which is a favorite retreat for him if he can find one; place your trap in front of the hole and disguise it as much as you may—cover it a foot deep with leaves if you like—but that coon will never leave that hole as long as that trap is there. He will starve first. He can smell the iron of that trap, and he seems to know it will be death to leave the hole, and he prefers death by starvation to being trapped. I have tried iron traps and snares and all sorts of devices, but never could succeed in fooling one of these little beasts into getting caught by any of them.

"It isn't often you seen a coon in the daytime, but you may, if you know where to look for them. If there is a creek anywhere in which crawfish abound, you may see some epicurean coon fishing for them almost any day, along in the afternoon, if you hide at the side of the creek and keep very quiet. The coon is particularly fond of crawfish. The way he fishes for them is to wade in the creek, generally going down stream. The crawfish live under the stones on the bottom. The coon feels with his forepaws under each stone he comes to, thrusting one paw under from one side and the other paw from the other side. It is a comical sight to see a coon fishing for crawfish. He keeps his head high in the air, moving it up and down and to and fro, his eyes evidently gazing at nothing, every sense seeming to be concentrated on the business beneath the water. You can tell instantly when he has fastened on to a crawfish, for the expression on his face changes at once from the dumb, vacant stare to one of brightness and animation. He draws the crawfish out of the water, and standing erect on his hind feet, rolls it smartly between his paws. This crushes the shell and claws of the crawfish and makes the sweet meat accessible. The coon eats his capture with great relish, and then begins the search for another one.

"While watching a coon fishing in this way one day, I got the idea of trapping coons. I thought that by placing a steel trap on the bottom of the creek where coons found the crawfishing good they might be deceived, and more than likely caught. I made the experiment. I sank two traps at different places on a favorite crawfishing route for coons, and the same afternoon found a coon in each trap. I have trapped hundreds of them since then, and that is the only way you can trap a coon."—Fur Trade Review.

Dead River Region Game.

Stratton, Me., Aug. 2.—Replying to numerous inquiries from readers of the Forest and Stream in regard to a truthful statement as to the game to be had in the Dear River section of Maine, I will say that moose are quite plenty, and under the present existing law will continue to increase. I think the chances will be very good to secure some fine specimens this fall, after Oct. 15. Black bears are quite numerous, and a large number have been trapped during the present season. Deer are too numerous to mention, and every sportsman coming into this section is sure to get his number of bucks which the law allows. Caribou are not plenty; occasionally one. Ruffed grouse, commonly called partridge, are much more plenty this season than last; and the outlook is fine for bird shooting after Sept. 20. The ducks promise to be an average crop. Specimens of fur-bearing animals are frequently seen, such as wildcat, blackcat, fox, lynx, beaver, otter, marten and mink. I shall be pleased to furnish reliable information to sportsmen intending to visit this section on a hunting trip this fall.

A. M. Jones,
President of the Guides and Sporting Camp Owners' Association.

Not all of Shooting to Shoot.

Titusville, Pa., Aug. 1.—The Herald of to-day records that ex-Councilman Charles F. Emerson had a thrilling experience out on the old Tidioute grade Saturday afternoon. Mr. Emerson was woodcock hunting and had just brought down a bird. In proceeding in the direction of the spot where it had fallen he walked right into a veritable nest of rattlesnakes. So intent was he in the search for the bird that he had not heard their warning rattles and was unaware of his danger until he caught sight of one of the reptiles directly under his feet. Jumping aside, he pulled up his gun and shot it before it could strike him, and turning around served another of the venemous creatures in the same manner. Mr. Emerson brought the two big snakes home, where yesterday they furnished indisputable proof of his exciting adventure. They had six and seven rattles respectively and measured 25in. and 28in.

Sea and River Fishing.

Black Bass of the Bay of Quinte.

Editor Forest and Stream:

I am well aware that your correspondents are expected to write for the purpose of giving your readers the benefit of the knowledge which they possess and not for the purpose of showing their ignorance, but this article is intended to be simply a confession of ignorance as to the habits and peculiarities of black bass.

I have fished for black bass more or less for over forty years, and many years ago was conscious that I knew all about them, but I don't now.

I used to know when they were through spawning and breeding their young in shallow waters, but do not any more, for our astute legislators have changed the time and the movements of the bass in these particulars, and they are now regulated by implication of law.

I used to think that, all other things being equal, experience and skill in casting the fly would always count for something, but they don't.

A few years ago we had three days during the first week in June exactly alike in character and temperature, and on the first two days I whipped a noted bass lake faithfully, taking but few bass, only two or three of which were of fair size. On the third day two persons who had never cast a fly in their lives visited the lake and learned of my success. Each of them had a long reed pole and a line of about equal length, and between them two flies which some one had given to them. They "slashed" over the same ground fished by me, and brought in twenty-seven small-mouthed bass, all of good size, a number of them being between 2 and 3lbs., in weight. If asked how this happened I can only give my usual answer, "I don't know," but it is not an unusual experience.

I have not fished long enough for bass, however, to become utterly ignorant, and still know something about them, and to show some things that I do not know it is necessary to state some of the things that I do know.

That black bass usually seek deep, still waters as winter approaches and remain dormant and to a large extent imbedded in the mud during the winter is a fact which has long been well known; also that as the waters become warmed by the sun in the spring they leave their winter haunts for their usual spawning grounds, and when these grounds are situated in the inlet or outlet of a lake they will migrate a long distance. In Lake Erie they go down the outlet nearly to the falls for spawning purposes, and large numbers of the bass in Lake Ontario descend the River St. Lawrence for scores of miles to reach their spawning ground, and from personal observation and examination, as well as from the information derived from others, I am satisfied that black bass will migrate down a river for the purpose of reaching suitable spawning grounds fully as far as shad will ascend the rivers on our coast for the same purpose.

Not long after the spawning season is over, and beginning probably in the latter part of July or the first part of August, the bass in the St. Lawrence begin their return to the lake, the fishing falling off first at the lowest point and continuing to fall off as they work up the river.

A party of anglers recently informed me that they had made their home for many years at Marysville, which is situated near the head of the river, about three miles from Kingston, for the reason that they were always sure of good catches late in the season, and always after the river below had ceased to furnish good sport.

Some two or three years ago, while examining into the habits of the bass in this river during the latter part of August, I happened to know that a party of anglers then fishing at a point some ten or twelve miles below Clayton made up a small purse, which was to belong to the person bringing in the largest black bass on the next day, and the purse was awarded on a fish weighing 6oz., and that shows or indicates at least that at this time the bass had largely returned toward the lake below and at this point.

At this time the fishing was more than indifferent as far up the river as Clayton, and it was found by personal test that it improved as we approached Marysville, at which point it was still excellent. It is, therefore, safe assume, in my judgment, that the above views as to the gradual return of the bass to Lake Erie in the latter part of the season are correct.

How far the bass which had been hatched in the St. Lawrence River when old enough to spawn return to the spawning grounds of the parent fish, as we know is the case with shad and salmon, is a question yet to be determined, but in my own judgment such is their habit; and if I am correct the depletion in the St. Lawrence can be easily accounted for.

In this river the fish have been taken both legally and illegally in such large numbers during many years past that comparatively few bass visit this river for the purpose of spawning, and it is not likely that those fish which have their habitat in other places will frequent the St. Lawrence for spawning purposes any more than the shad which are produced in the Hudson River would for the same reason change to the Connecticut, where the fish have become scarce.

If this is true, the evil suggests its own remedy, and that is that the bass in the St. Lawrence must be protected and the catch limited, or in a very few years that magnificent ground, the Thousand Isles, will afford no attractions to the angler for black bass.

But this is not what I started out to write about in order to show my lack of knowledge; it has been given largely to emphasize or explain my ignorance in regard to black bass in the Bay of Quinte.

This bay, as well known to most of your readers, commences not far westerly from the city of Kingston in the Province of Ontario, and extends along the northern shore of Lake Ontario for some ninety or one hundred miles, the head of the bay being about due north of Rochester. It is a sheet of water ranging from a half or three-quarters of a mile to two or three miles or more in width.

On the southerly side lies what is often called "the Garden Land of Canada."

The lands on the shores are in a high state of cultivation, and give evidence of great thrift and prosperity on the part of the owners.

About three miles from the head of the bay and at the mouth of the River Trent is situated the City of Trenton. Some twelve miles to the east is the city of Belleville, both on the north shore, and further down the bay is the city or village of Northport, from all of which some of the finest bass grounds in the bay can be easily reached for a day's sport.

The head of the bay is connected with Lake Ontario by the Murray Ship Canal, which is some six miles in length, and through which the line steamers to and from Toronto usually pass in order to avoid the rough water in the lake. With the exception of the channel, which is deep enough for all lake vessels, the bay abounds in numerous bars or shoals having usually a depth of water of perhaps 10 or 12ft., and from about the last week in August until in October these shoals and bars abound in large bass, running generally from 2 to 4¾lbs. in weight, the latter being about the limit of size, although larger ones have been occasionally taken.

I have taken and have seen taken many bass of the latter size, but have never seen one taken there that exceeded this weight. An average catch of 3lbs. is not unusual, and an average catch of 2½lbs. is very common in a catch usually ranging from ten to twenty bass in a day, and these are exclusively small-mouthed bass, no large-mouthed bass being found on the shoals, and just here I am moved to confess my ignorance and ask where do these fish come from? Inquiry of those who reside on the shores fails to solve the problem, and all the information which I have been able to gather from the inhabitants, as well as from those who have visited these waters in the summer, is to the effect that large bass are very seldom seen or taken there until about the beginning of September.

The water is hardly deep enough for them to remain in during the winter, nor, as their habits are generally understood, would they be apt to stay when they can so easily reach the deep waters of Lake Ontario. If they have no other home and hibernate in these waters in the winter they would be there in the summer and would naturally be caught, but those taken in the summer are essentially smaller than those taken in the fall.

In some of the issues of Forest and Stream last year or the year before reports of bass fishing in the Bay of Quinte were published during the summer months, in all of which, as I remember them, the fish were reported as being comparatively small and the catches were about the same as those in the St. Lawrence River at the same season of the year.

It seems hardly probable that they come from the St. Lawrence, as such large bass are rarely if ever found there any more, for the reason that these waters were long ago largely depleted of their large bass, and also because the bass in this river have very generally worked their way back into Lake Ontario before the fishing in the bay is at its best, which is from the middle of September to the middle of October.

Do they come from the lake in the early fall for the purpose of reaching their favorite feeding ground and then return in the latter part of October? Possibly, but if so then we have something yet to learn as to the habits of these fish.

How far these feeding grounds are peculiar to the Bay of Quinte I have no means of knowing. It is claimed by the oarsmen who have frequently visited these waters that the bottom where the shoals exist is covered in the fall, but not earlier, with grasses and aquatic weeds which are a few inches high, and which abound in small fish, and that these attract the bass. In "dragging" or "drifting" with a small minnow for bait the bass usually take the bait near the bottom and just above these grasses or weeds.

As a general rule the bass do not appear to run in schools, but are more or less scattered over the shoals. On one of my last trips, however, my companion took in one day on a very limited portion of one of the shoals eleven bass that weighed 31lbs., which indicated that he had struck a school, all of them being large fish.

On one afternoon during a previous trip the water became too rough for drifting, and we were obliged to anchor our boat, which we did close to or directly over a bar, which was near the surface, and we soon caught on short lines some fifteen or twenty fish of all sizes ranging from less than a pound to over 4lbs. in weight, and this indicated not only a school of bass, but also that the smaller ones are not afraid of the large ones, and do not keep out of their way; and this was only a repetition of a like experience on one or two other occasions when forced to anchor, but when drifting over or near this same bar I have never taken anything but large and usually very large bass.

If I am correct as to these facts they do not throw any additional light (but rather shed darkness) on the solution of the question, where do these large bass come from, and why are large ones almost exclusively taken and small ones so seldom taken when drifting over these shoals?

J. S. Van Cleef.

Poughkeepsie, July 30.

To those who contemplate visiting the Bay of Quinte for the first time I think that I ought to say that not only but St. Lawrence oarsmen should be employed. There are several of these oarsmen at Clayton who are thoroughly acquainted with all the good grounds in this bay. The local oarsmen are not provided with the Clayton boats and are without experience in caring or catering for anglers.

J. S. V. C.

The Vermont League Meet.

The third annual midsummer meeting of the Vermont Fish and Game League was held at the grounds of Lieut.-Gov. N. W. Fisk, at Isle La Motte, Aug. 3, with an attendance of about 300 members of the League, their ladies and invited guests. The meeting was in every way successful. While it was impossible to entertain so distinguished guests as those who honored the meeting in 1897, the gathering was not lacking in entertainment of a social nature. It was the intention to omit everything of a post prandial character, but at the close of the business meeting there was so emphatic a call for two or three speakers that they were forced to respond.

The trip to Isle La Motte was made upon the steamer Reindeer, leaving this city at 12:25 and reaching the island about 2:30. The day was exceptionally fine, with a brisk, cooling breeze from the south; and all found the ride northward pleasant in the extreme.

After having gained appetite from the two hours' sail the dinner was the event of the day to everyone, and in this part of the itinerary nothing was wanting. The meal was served in a great tent in which had been placed long and commodious tables. Under the deft hands of the Ladies' Aid Society the tables had been trimmed with wild flowers and flags, presenting a very neat appearance.

As host and hostess Lieut.-Gov. and Mrs. Fisk left nothing to be desired. They were everywhere, looking after the pleasure of the guests in a thorough and gratifying manner, and even threw open their pleasant home to still further extend the welcome.

When the dinner had been accorded the attention which its quality merited, cigars were passed and President J. W. Titcomb outlined the work of the League, and said in substance:

"Without detailing to you what the League has been doing in the past, or what has been accomplished, I wish to explain some of the issues which present themselves and which should be of interest to all Vermonters, whether members of the League or not.

"First, in regard to game. Notwithstanding the slaughter of about 150 deer last October, the reports indicate that these animals are increasing rapidly. Many farmers report seeing them, and does with fawns are very tame, often entering gardens adjacent to farm houses. The League has expressed its disapproval of the open season in October, and the general sentiment of the State indicates that the law will be changed at the next session. One important feature to be considered in connection with deer legislation is a provision to protect deer against pursuit by dogs. At present any dog which has been licensed and wears a collar can pursue deer with impunity, and its owner is not liable. Not a week passes without complaints coming to me of deer pursued by dogs, and at all seasons of the year. In summer, when does are heavy with young, they are pursued as relentlessly as during the natural hunting season. Many deer have thus been killed. In early winter, after the ice has formed on the ponds, the dogs drive the deer on to them, where they either break through and drown or flounder about at the mercy of the dogs. There are men in this State who let their deer hounds out, and where a deer has been thus killed or crippled will sneak out in the night and get the venison.

"When the bill providing an open season was presented in the Legislature, it was argued that it would create a sentiment in favor of protecting deer during the close season. The commissioners now have cases pending where deer were shot over salt licks, trapped and snared in warm weather, and fed out to the help in saw mill boarding houses, with no attempt at concealment except the silent code of honor among thieves.

"No other game needs especial legislation or change in laws unless to provide an open season on upland plover.

"The fish in Lake Champlain, the chief attraction to summer tourists, are being ruthlessly slaughtered during the spawning season by the use of seines. I refer to the practice of seine fishing in March and April in the contiguous waters of Vermont and Canada, when the wall-eyed pike are following along the shores and entering the tributaries of the lake to spawn. The catch of pike during one spawning season from reports of Vermont fishermen indicate a destruction not only of tons of these valuable food and game fish, but by practical computations of over 300,000,000 to 500,000,000 eggs each season. This is a question of legislation which can be controlled by the representatives of the towns most directly interested. So long as the representatives of Grand Isle and Franklin counties consider the revenue of 25 or 30 seines, netting the fishermen from $6,000 to $12,000 annually, to be worth more than the larger sum of would-be summer visitors, so long will the present law exist. While it would be a seeming injustice to prohibit seine fishing in Vermont while Canada continues the practice, it is our fault that the Canadian law now exists. Canada stopped this practice four years ago upon agreement with your commissioners, and only resumed after legislation was obtained in Vermont compelling the commissioners to issue seine permits to all applicants.

"Through the instrumentality of the League the constitutionality of one of the game laws has been tested and upheld. I refer to the law authorizing the commissioners to stock and close waters for a period of years. When its constitutionality was questioned it tended to weaken all other game laws. The opinion of the Supreme Court, recently rendered, strengthens the entire chapter of game laws. The particular law affected was not in itself important, but can now be made so. At present a stream is stocked and closed for a period of two or three years. At the expiration of the closed period the stream is overcrowded with fishermen, and the work of restocking the waters is undone in one season. It would be better to permanently close the small tributaries throughout the State, and keep them as breeding preserves for all time, thus assuring us a stock of trout which could work into the larger streams. Of course such a law as this could not be enforced except in communities where public sentiment would sanction it, and it might be best to have towns vote as to the advisability of the method.

"The 6in. law on trout is observed in some sections and disregarded in others, is gaining ground as people come to know the real reason for such legislation. Trout do not generally spawn until they have attained a growth of six inches in length, and if the smaller trout are caught out, natural reproduction ceases. It is impossible to attempt to keep up the waste entirely by artificial stocking without a larger expenditure than we would feel warranted in calling upon our Legislature to appropriate.

"I will mention one other subject in which all the ladies should be interested. Many of our streams, which were formerly the habitat of the brook trout, have become depleted by the changes in natural conditions surrounding them. I refer to the destruction of our forests. The forests subserve two purposes—supply of a most necessary raw material, and amelioration of the conditions of climate and water flow. Experts on the subject can produce figures to show that by proper regulation, restricting the size of trees to be cut, etc., the forests can be made more remunerative to the lumberman than when entirely stripped at one time, as is the prevalent custom. One lady has suggested that the subject of protecting our highways from disfigurement by proper pruning of shade trees instead of cutting them down entirely have the attention of the League. This forestry question properly belongs to a forestry commission, and many States now have an efficient forestry board and are legislating in this direction. The subject affects the objects of the League only as it affects the water supply in our streams. The sawdust question is akin to the forestry question, but I will not take up your time with this subject excepting to say that the pollution of our streams with mill refuse and sawdust does more injury than any work of our hatchery can repair."

The call for the meeting was read by Secretary Thomas Deal, of St. Albans, and twenty-seven names were proposed for membership, and their election made by an authorized vote of the secretary.

Lieut.-Gov. Fisk proposed the name of John H. Flagg, of New York, as an honorary member, and he was elected. Ex-Gov. Woodbury suggested the name of Admiral George Dewey as an honorary member, and he was elected by a rising vote in which the ladies were allowed to join. Henry L. Dodge, of San Francisco, who was present, was also made an honorary member of the League. Senator Proctor, ex-Gov. Woodbury, Congressman Grout, and Judge Powers spoke briefly. Our report is taken from the Burlington Free Press.

St. Lawrence Anglers.

Editor Forest and Stream:

The fifteenth annual meeting of the Anglers' Association of the St. Lawrence River was held at the Thousand Island House, Alexandria Bay, on Wednesday, Aug. 3, and great interest was manifested in the proceedings. The Association is an earnest, active and influential organization, consisting for the most part of representative citizens of the northern counties, and prominent professional and business men from various parts of the country, who have summer homes in the island region. Among those in attendance at the annual session were: W. C. Browning, Royal E. Deane, New York city; Henry R. Heath, Brooklyn; General J. B. Van Petten, Claverack; Frank P. Denison, Syracuse; Col. O. G. Staples, A. C. Cornwall, W. H. Thompson, Walter Fox, Alexandria Bay; G. M. Skinner, R. P. Grant, Clayton; C. E. Britton, Gananoque; Col. W. M. Griffith, Utica, and others. Considerable attention was devoted to the subject of the State park on the St. Lawrence River, and the desirability of having the balance of the $30,000 appropriated by the State to purchase land there expended for that purpose without unnecessary delay. It was 11 A. M. when President Browning called the assemblage to order. W. E. Wolcott, of Utica, was elected secretary of the meeting. The minutes of the last annual session and of three special meetings of the executive committee were read and approved.

Appropriate resolutions on the death of Hon. C. W. Hackett, of Utica, chairman of the Republican State committee, who was a valued member of the Association, were adopted.

W. H. Thompson, secretary of the Association, in his annual report said: In pursuance of a resolution adopted by the executive committee, I wrote several captions and sent them to parties at the foot of the lake, asking the Legislature to close the waters, and we have not had a single response. The only thing that was done was by personal efforts at Albany. We got our members of Assembly, Hon. E. R. Brown and Hon. O. J. Clark, interested, and Section 132a of the laws of 1898, prohibiting netting from April 30 to Oct. 1, was passed. It was that or nothing, and we accepted the compromise. Last year the Association, by resolution, asked the Commissioners of Fish, Game and Forests to purchase the following named points and islands for the use of the public: (1) Cedar Point, with right of way from same to State road, about twenty acres in all, situated about seven miles above Clayton on the American mainland, and owned by A. D. Percy. (2) Delaney's Point, sixty acres or more, situated at the foot of Grindstone Island, owned by the heirs of J. J. Delaney. (3) Cement Point, about three acres, at the head of Grindstone Island, owned by Moses Herse. (4) De Wolf's Point, about ten acres, on the north shore of the Lake of the Isles, owned by Frank de Wolf. (5) Island Mary, at the foot of Wells' Island, owned by the Westminster Park Association. (6) Kring's Point, about thirty acres, in Goose Bay, owned by George Kring. (7) Day's Point, about ten acres, near Chippewa Bay, owned by S. W. Day. (8) The inside Chippewa Point, owned by S. Allen. The commisison has purchased Kring Point, the foot of Cedar Island, De Wolf's Point, Mary Island, Delaney Point and Cement Point. At a meeting of the executive committee of the Anglers' Association Messrs. Cornwall, Grant and Thompson were selected to look after the Legislature in the interests of the St. Lawrence Park, and with the aid of our members of Assembly, Messrs. Clark and Brown, we secured an appropriation of $10,000 for improvements, building docks and making skiff landings on the property purchased for park purposes. We find it has been a very laborious task to get the commissioners to invest the $30,000 appropriated. The Anglers' Association has a membership of about 250, about 200 being fair paying members. During the past year the Association lost these members, deceased: George M. Pullman, C. W. Hackett, J. Y. Walch. The report of the secretary was adopted.

Three or four resignations were accepted, and six new members were admitted.

President Browning inquired how much of the $30,000 appropriation for purchasing lands for the St. Lawrence Park had been expended.

Mr. Cornwall thought about $14,700 had been expended thus far.

President Browning, in his annual address, paid a handsome tribute to the memory of Hon. C. W. Hackett. In regard to the fishing in the St. Lawrence River, Mr. Browning said: "Earlier in the season I heard some complaints concerning the bass fishing, but lately it has improved greatly. Some of the catches are now phenomenally large in the upper part of the river and the lakes. The fishing is wonderfully good. One gentleman told me he caught seventy-four bass, and never saw anything like it before. Another gentleman said he had never before seen the fishing so good for five miles above Clayton. We had no fishing earlier in the season, when it is usually expected. Whether the cold weather had anything to do with it or not I do not know, but the fishing is good now, whereas it is usually good in early June."

President Browning—In previous years large quantities of black bass have been sold in New York markets in cold weather, but during the past season I haven't been able to find any.

Col. Griffith—Don't you think that was due to the repeal of Section 230 of the game laws?

President Browning—I wouldn't wonder if it was. There used to be barrels of them in the markets, and dealers said they bought them for two cents a pound.

Col. Griffith—Reports are received which lead us to believe that the repeal of the cold storage section is having a good effect.

Treasurer Grant submitted his annual report, which showed that the amount of cash on hand last year at this time was $266.26; on hand at present, $359.22. He explained that the increase was mainly due to the handsome donations made by individual members last year. The report was adopted.

Mr. Cornwall, chairman of the executive committee, reported that several meetings of that body had been held during the year, and things had been looked after as closely as possible.

Mr. Thompson said that while he was in Albany he was asked what he thought about allowing the setting of lines in the river from Ogdensburg to Chippewa Bay. He replied that he thought it would be very objectionable.

Mr. Heath—There does not seem to be much progress in the land business, and I think the Association ought to appoint a committee to push the matter along. I suggest that we have a committee with the president at the head to endeavor to have the balance of the money appropriated by the State to buy land expended for the benefit of the river. Delays are dangerous. A committee should be appointed to co-operate with the State officials and bring this matter to a consummation.

Mr. Grant—We recommended the purchase of certain places along the river, and they virtually ignored us. This $30,000, whatever is not expended in two years, reverts back to the State. We should have had a local commission.

Mr. Heath thought it would have been as well if the recommendation of the Association in regard to the places it desired to have purchased had not been published.

Col. Griffith—There are always two sides to a question. The comptroller is particular, and he has to be. He will not turn the money over to the commission until the papers are correct. You have taken months to perfect titles. The commissioners are not all to blame for the delay. In regard to Mary Island, I urged its purchase, and other places where the title was correct. Something ought to be done before Oct. 1. The money lapses at the close of the fiscal year, which is one year from October. The second appropriation was put in for improvements only, and can hardly be used for purchasing land. Some of the commissioners are exceedingly anxious to finish up this matter. I agree with Mr. Heath regarding the advisability of appointing a committee. We have lost a hard worker by the death of Mr. Hackett, and the rest of us will have to work harder.

Mr. Heath—We should try and get this money expended for the benefit of the river.

Col. Griffith—The commissioners said they would try and get up to the river while I am here, and if the Association desires me to do so I will write them to come soon.

There was some talk about the St. Lawrence county people wanting a point below Ogdensburg purchased, and Messrs. Browning, Griffith and others thought it would be wise to acquiesce.

Mr. Thompson said the Association obtained the lowest prices that parties would take for the places it wanted purchased. "That was the reason," said he, "why we mentioned a price."

Col. Griffith, who is private secretary of Governor Black, was elected an honorary member of the Association.

Mr. Grant offered the following resolutions, which were adopted:

Resolved, that a committee be appointed by the president to co-operate with the Commissioners of Fisheries, Game and Forest in the further purchase of land, in accordance with the law of 1897, appropriating $30,000 for the establishment of a State park.

Resolved, that it is the desire of the Association, without in any sense wishing to advise this commission, that the completion of the proposed purchase be made before Aug. 1, 1899.

Messrs. Heath, Griffith and Grant were appointed as the committee called for in the above resolution.

Officers for the ensuing year were elected as follows: President, Wm. C. Browning, New York city; First Vice-President, Henry R. Heath, Brooklyn; Second

Vice-President, Hon. Charles R. Skinner, Albany; Secretary, W. H. Thompson, Alexandria Bay; Treasurer, R. P. Grant, Clayton; Executive Committee, A. C. Cornwall, Col. O. G. Staples, Walter Fox, Alexandria Bay; George C. Boldt, New York; George H. Strough, G. M. Skinner, John Foley, Clayton; Col. W. M. Griffith, Utica; F. A. Gillespie, Pittsburg, Pa.; C. G. Emery, New York; R. H. Pullman, Baltimore, Md.; Hon. G. R. Malby, R. E. Waterman, Ogdensburg; Charles E. Britton, Gananoque.

On motion of Mr. Grant the executive committee was authorized to act on any questions of legislation that might come up during the year.

It was stated that the executive committee last year applied for 2,000,000 muskallonge fry, and that 750,000 were received and distributed in the St. Lawrence River between Clayton and Alexandria Bay. The fry were from the Chautauqua Lake hatchery.

Mr. Thompson said good results had already been observed from stocking the St. Lawrence. He did not think it best to make any more requisitions for wall-eyed pike, however.

Mr. Heath said the largest muskallonge he had ever seen caught in the river weighed 35lbs.

G. M. Skinner said he recently had the pleasure of presenting a 35lb. muskallonge to the wife of Vice-President Hobart while at Alexandria Bay.

Mr. Britton invited the Association to meet in Gananoque next year. He said they had taken a step in the right direction on the Canadian side during the past year, and had secured an overseer of overseers. On his motion it was decided to recommend to the president of the Association that the next annual meeting be held in Gananoque.

The propositions to have copies of the minutes printed and circulated, to have official buttons made and to make a slight change in the by-laws, were referred to the executive committee.

The Association concluded its business shortly after 1 P. M., and by invitation of Col. Staples the members repaired in a body to the dining room of the Thousand Island House, where an elaborate banquet was served with the compliments of the genial proprietor. At the plate of each guest was a little silk flag, the Stars and Stripes covered with a network of silver thread and attached to a long pin. Underneath the network was the inscription, "1,000 Island House." The menu cards, gotten up expressly for the occasion, very appropriately bore the official design adopted by the Anglers' Association for use on its stationery. The long table at which the guests were seated was beautifully decorated with flowers and contained also an artistic centerpiece, the chief feature of which was a mammoth salmon.

The anglers extended a unanimous vote of thanks to Col. Staples for his generous hospitality.

W. E. Wolcott.

Utica, N. Y., Aug. 4.

Men I Have Fished With.

LXIII.—Dr. James A. Henshall.

In Forest and Stream of a fortnight ago, p. 70, there is an article on the grayling by Dr. Henshall, in which he claims that the grayling of Michigan and Montana are the same species, which he calls *Thymallus lewisii*. He fails to say who described the fish under that name, but claims that it is "in accordance with the law of priority," which may be true, but he gives no references. Years ago I fell so deeply in love with the Michigan grayling, when it bore Cope's name of *T. tricolor*, that I do not long to see the name lost; in fact, few of us like to accept new names in place of the old. A few years ago Dr. Henshall made researches in Paris which showed that American scientists had gone astray on the nomenclature of the two species of black bass, and they opened their eyes, wiped their glasses, examined the evidence and accepted the Doctor's conclusions, and the matter was straightened out, and will remain straightened. Remembering this, I will wait for "more about the grayling" before risking an opinion about that fish until we know what the Doctor may have up his sleeve.

How Black Bass Leap.

If there is any fish that he loves, it is the black bass, and he loves both species equally. In the long ago we were guests of the Castalia Club, and were trouting in the waters of that gigantic Ohio spring, and the trout were doing their part to perfection. My friend had just unhooked a lusty trout, but his mind turned in an instant, for he asked: "Did you see what Rob Roy said in Forest and Stream about the leaping of the black bass?"

"No doubt I did, for I read the paper carefully, but make no pretension of committing it to memory, nor of arguing at length with a man who differs with me. How long ago was the article published to which you refer?"

"In the latter part of 1884 or early the next year, can't place it exactly; you must have seen it."

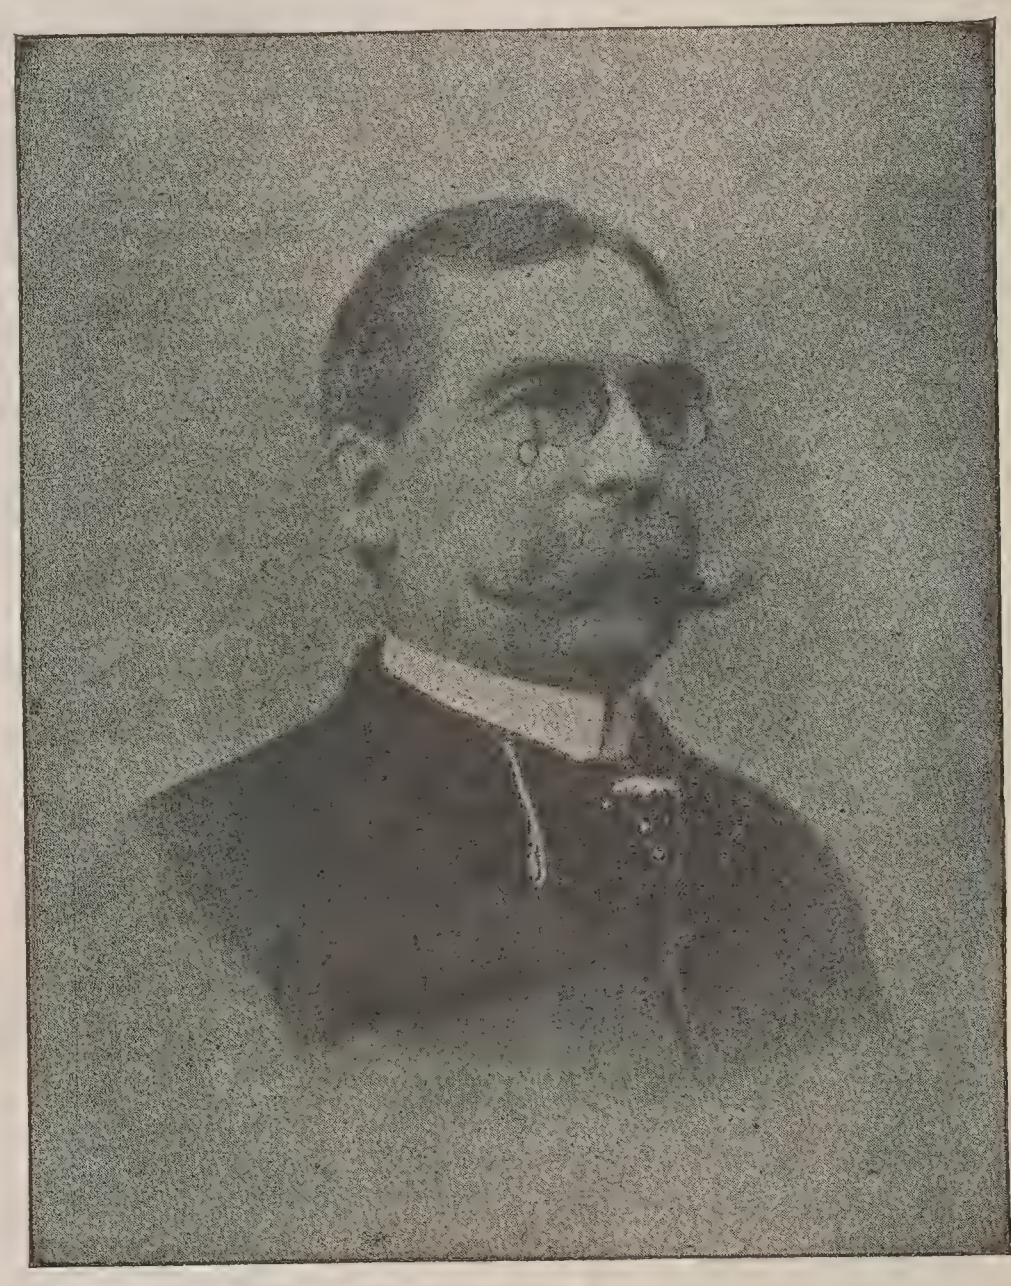
"Very true, but, my dear Doctor, if you will release your mind from the fly which you hung up in that bush and are trying so hard to recover, and will concentrate it on what Rob Roy said about the leaping of black bass, I will not only regard you as sane, but will consider, cuss and discuss the leaping powers of black bass with you, as far as I am able. At present I am ignorant of the question before the house."

The Doctor gave an impatient yank, leaving the fly in the bush, intimating that he had lost more time than a fly was worth, and as he selected another lure to replace the lost one looked up and said: "Why, Rob Roy says the big-mouth never leaps after being hooked; that is simply nonsense."

"Certainly, 'it needs no ghost, my Lord, to come from the grave to tell us this,' even I know better than that. Any more?"

"Yes, in his effort to elevate one fish by running down another, which is equally as good, he says that the small-mouth leaps often, and to a height of 3, 4 and even 5ft. What do you think of that?"

"Doctor," I replied, "I can only say that 'this beats all my goin' a-fishin.' I've seen both species leap from the water when hooked, but 5ft.! Gee whiz! That's nearly as tall as we are; no, I never saw a black bass reach up 4ft. into the atmosphere."



"Having admitted so much, did you ever see one of these fishes leap 3ft. when hooked?"

"The fact is, Doctor, that when it has been my fortune to hook a black bass, it has been on the end of a line so long that I could not get out a rule nor tape to measure the leap, but if your object is to extract from me what I would be willing to make affidavit to, why, I would put 1ft. as the average leap and add half that distance as the maximum."

"Just my figures, and I have fished for black bass in all parts of the Union where they are found; have talked with anglers and fishermen, but never heard of such leaping before."

"All right, Doctor, after we get down to the club house and have dinner let us compare notes on bass flies. Our friend Mr. Bacon is fishing up this way, perhaps to suggest that we work down stream and prepare for dinner."

There were other statements made by Rob Roy which the Doctor promised to discuss, but the show-down of trout and the dinner banished them all, and as we smoked we talked with our friends on almost every subject except the leaping powers of black bass, and there the subject dropped.

DR. JAMES A. HENSHALL.

Book of the Black Bass.

A sketch like this cannot be turned into either a fulsome obituary notice nor a book review. It could not be an obituary because the Doctor is still living in a most vigorous manner, and two years ago was appointed superintendent of the U. S. Fish Commission, in charge of the hatchery at Bozeman, Montana.

But his book, "The Book of the Black Bass," will be all the monument and "obituary" that any man might crave. It is the most distinctively American of any fishing book ever published. It deals with a grand pair of American game fishes which had received scant attention from angling authors; not more than had been accorded to the perch and similar fish until Henshall made the declaration that: "Pound for pound, the black bass is the gamest fish that swims." Then Americans began to regard these fishes in a new light and Henshall was dubbed "the apostle of the black bass."

The book covered over 460 pages, and went into so much detail of nomenclature, habits, tackle, baits, flies and all that pertains to these fishes that we anglers thought that the subject was exhausted, but in the same year, 1889, he gave us 200 additional pages in another volume, entitled "More About the Black Bass," as a supplement to the first volume, and with the Queen of Sheba we found that not half had been told. Dr. Henshall put the black bass among our gamiest fresh-water fishes, and properly labeled it "the game fish for the million," for the trout waters are not so accessible and the trout are not as plenty. His book at once set fish commissioners at work stocking suitable waters with these fishes, and when the lands are denuded of timber and the trout streams have dried up a future generation of anglers will rise up and call the Doctor blessed for booming two neglected fishes into the first class, where they rightfully belong.

Having read his book several times, the only adverse criticism I would make is on the title, which should have been: "Book of the Black Basses," thus clearly indicating that there were two species.

His Views on Bait-Casting.

When the National Rod and Reel Association was alive and holding annual tournaments in Central Park, New York city, the Doctor was anxious to have a contest in bait-casting from the reel, and formulated a set of rules for it, and sent them to me, as secretary of the Association. They were not adopted, for two reasons: There were not prizes enough for another class, and if there had been prizes there would have been no entries, because the "Henshall style" was not practiced in the East at that time. Many Eastern anglers cast a minnow that way now, i. e., by dropping the tip of the rod below the elbow and checking the reel with the thumb. We had two classes for salt-water striped bass casting which differed only in the matter of weight of the sinker, and the casts were made by reeling up to about 1ft. and casting over the shoulder. The Doctor was indignant that his favorite cast should be left out, and wrote me a sharp letter under date of Oct. 9, 1885, but as I knew that he was right, but a little in advance of the Eastern anglers, whose committee did not make a class for black bass casting, for reasons already given, the letter did not disturb our friendly relations.

Dr. Henshall said: "I was about to start for New York, but the postponement of the tournament knocks me out, as I had an engagement to fish the 'sunken lands' of Arkansas, and also to do some ducking for a month, beginning Oct. 20. * * * My regret is somewhat modified, however, at the action of the committee in altering the rules of the black bass minnow casting so as to allow 'overhead' casting. Was this to combine black bass and light striped bass casting? A poor economy, I should say. It is well enough to leave out the latter altogether, as the contest for heavy bass casting is sufficient and is characteristic. Angling for small striped bass is done in a variety of ways, and the black bass rules should not have been changed in the manner noted. Throwing a bait overhead is the mode used by every boy and negro in the South, who do not use reels. I am afraid that the committee do not understand black bass fishing as well as they ought."

The Doctor was merely a little "previous." This correspondence occurred over a dozen years ago, when his excellent mode of minnow casting was practically unknown to the anglers of the effete East, while to-day hundreds of the brethren from New York to Maine use it. Henshall was a missionary, confident in his own belief, but impatient of a delay in its acceptance by others who heard it for the first time. To-day he can see that the tree which he planted has borne fruit, if it did not do so on the next year after he planted the seed. As a rule young men do not plant trees, they have no time to wait; the Doctor was younger then and wanted his seed to become a tree and bear fruit at once. He is older now and can look back with a pleasurable pride at what he has done in the way of placing black bass fishing on a higher plane, and can realize that it took only a dozen years to do it.

A Happy Man.

It has been said that a man's happiness lies within himself, and the genial, jolly subject of this sketch proves it, for he has a keen sense of humor, a fund of anecdote and not only loves music, but can "do it." When at my Long Island home he mentioned some old darky song which I had forgotten, and went to the piano and rendered it as Luke West or "Old Dan" Emmett might have done when we were boys. He took to fishing, shooting, sailing and canoeing as recreations from the arduous routine duties of a physician, and later took up

the study of fishes and zoology in general as a means of recreation. These he found so engrossing that he was forced to abandon them or give up his practice, and he chose to stick to his later love and gave up medicine. This is how he came to look up the type specimens of the black basses when in Paris, for they were first described by the French ichthyologist Lacépède, and the original, or types, were taken away by him. The Doctor was one of the Fish Commissioners of Ohio for several years, and made a study of fishculture, which he is now putting to practical use.

I ran against the Doctor in Chicago at the World's Fair. "Come on," said he, "let's go down on the Midway, the 'streets of Cairo' open to-day and you'll enjoy a sniff of the camels." Soon his attention was attracted by hearing a familiar voice crying: "Come, ride-a my donk'; Yankee Doodle donk'; best-a donk' in Ki-i-ro!"

He immediately recognized the same donkey boy he had employed many times in Cairo, Egypt. "Hello, Abdallah! Do you remember me?" he asked.

After looking a few moments the boy's face lighted up with a broad grin, and he exclaimed: "Oh, yes. You been old Kiro; you Doc. Oh, yes, me ver' glad see you."

The Doctor shook his hand heartily, for the poor fellow seemed delighted to meet some one from old Cairo; and calling to another donkey boy, shouted: "Hey! Ibrahim! Come; run; here Doc., been Kiro!"

Ibrahim came quickly, whom the Doctor recognized as a boy who was employed at the hotel in Cairo, and said: "Oh, yes, Abe, from Shepherd's Hotel; I know you well."

"Yes, dat right, Sheppad's Hotel," he replied. "But all same donk' boy now; good donk' boy."

They were both pleased to see some one who had been to "Old Cairo," and offered their donkeys to the Doctor for a free ride, but he assured them he never rode donkeys in America. He asked: "Well, how do you like the United States?"

"Oh, him big country; good beer; good whisk' too!"

"Come on," said the Doctor, "these boys have progressed rapidly in this country; by the time they leave Chicago they will be mentally equipped to open jack-pots on the pyramids."

"Jack-pots," said I, "I've heard the name somewhere, what are they, Doctor, anything like eel pots, set for pike or jack?"

The Doctor was absorbed in a rollicking Irish jig which a piper was playing in front of the Irish Village, and answered, abstractedly: "No, they're set for suckers, one fellow opens them and another fellow gets the net results."

Dr. Schliemann and Fred Douglass.

After the waiter had taken our order, an amused expression came over the Doctor's face as he beat triple bob-majors on the table ith his fingers' ends, and it continued so long that I said: "That may be a very funny story you are telling yourself, but I can't see the point."

"My dear boy, those donkey boys have brought up reminiscences, and, pardon me, I forgot myself for the moment. The particular thing of which I was thinking is not too awfully funny, but just a little so. You see, when I was in Egypt I became acquainted with Dr. Schliemann, the great investigator of Greek antiquities, who had been spending the winter up the Nile. We went to Athens on the same steamer, and among other passengers were Mr. Fred Douglass and his wife. Mr. Douglass was placed at the head of the table by the Egyptian steward, who no doubt thought him, from his venerable and commanding appearance, to be some great African dignitary. During the dinner on the first day out, Mr. Douglass, turning to Dr. Schliemann, who was seated at his right, asked: 'Do you intend to make much of a stay in Greece?'

"'Yes, I guess so,' replied Dr. S., who looked like an ordinary German business man.

"'Well, you'll find it a very interesting country,' returned he. 'I have never been there, though I have always been much interested in Greece. Of course, all countries are more or less alike in their physical features; they all have their air and sky, their hills and plains, their mountains and valleys, lakes and rivers; but it is not so much that as the history of the people who live or have lived in a country that interests us.'

"'Yes, I guess so,' replied Dr. Schliemann.

"'Now, from my earliest reading I have been particularly interested in the history of the ancient Greeks.'

"'Yes, I guess so,' assented Schliemann.

"'Now I find I have forgotten a great deal of my Greek history, but lately I came across a little book that has proved invaluable to me, not so much for the information it contains as that it recalls so much that I had forgotten concerning Greece and the Greeks.'

"'Yes, I guess so,' said Dr. S., poking me with his elbow.

"'Now, if you, sir, intend to make much of a stay in Greece, I would advise you to obtain a copy of this book, it is Murray's Guide to Greece.'

"About this time Schliemann was taken with a fit of coughing so violent that Douglass looked alarmed, but when it finally subsided S. said: 'Yes, I guess so.'

"It was excruciatingly funny, and when Dr. Schliemann and I afterward met the author of the book so earnestly recommended, Prof. Murray, on the way to Mount Parnassus, the staid Scotchman laughed immoderately at the recital of the incident, and said it was the best joke he ever heard, which is saying a good deal for a Scotchman."

The Man.

Dr. Henshall is of English descent, two of his forefathers being Rev. Samuel Henshall and Rev. John Wilkinson, joint authors of the "Domesday Book." He was born in Baltimore in 1842, and inherited a taste for terrapin, canvasback duck, rare, and oysters *au naturel*. Those of us to whom rare wild duck is, like caviare, olives and some decayed cheeses, an acquired taste, will appreciate the advantage of being born near the wild celery beds of Chesapeake Bay, where the canvasback reaches that perfection which it attains nowhere else. A man so favored is an epicure by birth.

As a boy he went to Cincinnati and studied medicine, and after graduation married and moved to Kentucky to practice, about the time the Civil War came on, where he broke down from overwork on both "Blue and Gray," and then removed to New York, and later to Wisconsin, where, under the *nom de plume* of "Oconomowoc," he began to write for FOREST AND STREAM of the charms of black bass fishing, and devised a rod which is still on the market as the "Oconomowoc," the name of a little village of which he was president.

In January, 1887, he wrote me from Havana, saying that Judge Longworth, of Cincinnati, and he were on their way to Spain for a cruise in the Mediterranean during the winter, returning in spring for salmon fishing in Scotland. He promised to write me an account of the trip, and as only some eleven years have gone by since his promise, I am watching the mails for the letter, which may come, if it was ever mailed.

The Doctor removed to Tampa, Florida, about 1894 on account of the health of Mrs. Henshall, and in September of 1896 he wrote that her health had been "much

YOUNG AMERICA.

benefited by her sojourn in this generous climate." To-day I read that our troops are to be removed from Tampa for sanitary reasons.

The Doctor as a Smuggler.

While we were smoking on my piazza the Doctor said: "Those Florida Crackers are a queer lot; a few years ago I had charge of a scientific exploration in Florida, with the schooner Grampus, and did the work along shore in a mackerel seine boat rigged with two masts and sails. One night, when anchored off the fishing ranch of Mr. McIlvane, on Sarasota Bay, a fierce southwest gale sprung up, causing a very heavy sea which would have swamped the boat in a short time. As there was no lee or harbor on that side, it became necessary to cross to the opposite shore of the bay. Getting under way at daylight, with but a small bight of the foresail, the boat fairly flew with the gale astern, the sea curling over both gunwales. In forty-five minutes we reached Long Boat Inlet, eight miles away, where it was as smooth as a mill pond under the mangroves. While mooring the boat, two old gray-bearded fishermen approached, one carrying a bottle.

"'Good mornin', Cap.!' said he.

"'How are you, men?' we replied.

"'Well, me and my partner 'ave bin gittin' up before daylight all week to ketch the tide, and I'm most dead with rheumatics; I want to git a little rum.'

"'You have come to a poor shop for rum,' I answered.

"'Oh, I only want a quart,' he persisted.

"'I have no rum; I would not object to a drop myself just now, as we are soaking wet and pretty cold.'

"'Oh, it's all right, Cap.; just let me have a quart.'

"'See here, men,' said I, 'this is a Government vessel; don't you see the flag that man is just hoisting? And positively, I haven't a drop of spirits aboard, or you should have it, and welcome.'

"The old fellow's face was a study, and ludicrous to behold, with disappointment and disgust contending for the mastery, as he said: 'If you 'aven't got smuggled rum aboard, and the rev'nue of'cers ain't after you, what in Sam Hill did you cross the bay fur in this gale?'

A Lost Bass.

The Doctor's stay on Long Island was short. I took down my old-time banjo and pulled every cork in the house, but he resisted all temptation. Yes, he would fish in the mill pond toward evening for the big-mouth black bass, and then there was a gathering of rods, reels, fly-books and a sending of men for the salt-water fiddler crabs, because we were not honored every day by such a black bass angler.

My man brought frogs as well as fiddler crabs, and we ventured our lives in a scow on the mill pond. We tried flies and all sorts of lures, but the bass declined them all, but we persevered until sundown.

Just as we decided to give it up the Doctor had a rousing strike, and by the way the reel sang before the rush could be checked we knew that he was fast to a good one. When the rush was stopped, the rod bent and quivered for a moment, and then the quivering ceased; the line was around the stem of a water lily some distance away. The Doctor kept a strain on the rod as we neared the spot, and when I pulled up the lily stem the bass was gone.

As we left the pond and walked toward the house, the Doctor broke the silence by asking: *"Quo hades vadis piscis?"*

I truthfully replied: "Durned if I know."

FRED MATHER.

The Brown Trout in Tasmania.

ZEEHAN, West Coast, Tasmania.—*Editor Forest and Stream:* I have not done much in the way of sport since I left home some eighteen months ago for the mining fields on the West Coast of Tasmania. The West Coast, or, more correctly speaking, the western half of the island, is nothing but a wild, rugged, mountainous region, the mountains reaching an altitude of 5,000ft. The great hills and deep valleys are clothed with dense beech and pine and eucalyptus forests and scrubs, and are full of small lakes, with one or two of considerable size. This county also has a large water system in its rivers and numerous creeks, which empty into the southern Pacific Ocean on the coast, whose shores the mighty rollers of the Southern Ocean never cease to surge and roar. The moisture-laden winds that come off the ocean cause a heavy precipitation of rain, amounting to 100in. annually.

This region possessing such a wet climate, and there being no pasture lands which can support any ordinary animal, but only wombats, a few brush kangaroos and other insignificant marsupials which nature has made fit to find an existence in such a cheerless country, there is no wonder that it supports a scanty fauna and avifauna, and is not worth the sportsman's time and trouble pursuing game.

Being a lover of the gentle art, I had the good fortune to have some of best sport any man could wish to have during my holiday; and after not having a rod in my hand for nearly three years, I took it up again with increased enthusiasm.

The brown trout has been acclimatized in Tasmania. The rivers are for the most part fairly rapid, clear streams, alternating with still, deep pools, and the rivers and streams in the west country are of a coffee color from the peaty soil in which they take their rise and flow through. The river in which I caught my fish is somewhat different, being a small insignificant stream, and for the most part sluggish, opening out into long and deep reed-fringed pools, which are inhabited by hundreds of magnificent brown and what I think to be a hybrid species—neither a brown trout nor a salmon trout, but at all events a finer fish than the brown trout, better shaped, gamier and better eating.

Until this season I had never killed anything like the quantity of fish, especially in the large, still waters, on account, I think, of the scarcity of food in winged insects, but we have experienced an unprecedentedly dry summer, which has brought with it among other unwelcome things, such as bush fires, etc., a small plague of grasshoppers. It is to the presence of these insects I owe my good sport, as the trout feed exclusively on them as they fly into the water. Upon examining every fish I killed I found their stomachs full of grasshoppers. The flies I chiefly used were the red-spinner, Alexandria, March-brown, Cocky-Bondhu, and to these I attached the hopper.

The best time for fishing I found was from 7 A. M. till 1 P. M., because a cold sea breeze would set in about midday and not a fish would rise after that. I suppose that the sudden change in the temperature or the atmospheric conditions stopped the fish from rising. I found that the best days for fishing were when a stiff westerly breeze was blowing (the river flowing from east to west); they would rise well, as on account of a strong ripple on the water they could not so easily see you.

Altogether I caught 150lbs. weight of fish, and my brother also caught about the same; so that is 300lbs. weight of fish between us, so that it was a good season's angling.

V. LEGGE.

Chicago Fly-Casting Club.

CHICAGO, Aug. 6.—*Editor Forest and Stream:* The score of our seventh contest, held this afternoon, is as follows:

J. D. Belasco..... ..		..	..	82 3-5
I. H. Bellows.....113	95 1-3	96		95 2-5
B. W. Goodsell.....109	92 2-3	95 5-6		91 1-5
H. Greenwood	..	..		96
H. G. Hascal 105	89 1-3	91 1-2		96 1-5
N. C. Heston..... ..	90 2-3	93 5-6		87 1-5
E. R. Letterman..... ..	80 2-3	77 5-6		91 3-5
C. A. Lippincott..... ..	97 1-3	93 5-6		88 3-5
C. G. Ludlow.....100	92 1-3	94 1-6		86 1-3
G. A. Murrell..... ..	91 1-3	90 1-2		93 1-5
F. N. Peet.....114	94 2-3	94 2-3		97 3-5

Holders of Medals: Long distance fly, F. N. Peet; distance and accuracy, C. A. Lippincott; accuracy and delicacy, I. H. Bellows; bait casting, F. N. Peet.

Young America.

TYPICAL young America to-day is a fisherman, equipped as no boy before him has been fitted out for fishing. This particular individual of the type is Master Max Martin, son of Mr. H. W. Martin, of automatic reel inventive genius; and the fish represents 18lbs. of Maine trout.

CHICAGO AND THE WEST.

Illinois Fish.

CHICAGO, Ill., Aug. 5.—President Nat. H. Cohen, of the Illinois State Fish Commission, is good enough to put me in possession of some facts of a very gratifying nature regarding the supply of bass in the waters of this State. It surely seems that the commission is doing great work with the fish life of the overflows of the lower part of the State, and the results can not fail of notice later in an increased supply of game fish in all parts of Illinois. Naturally Mr. Cohen has a word to say for his friend, the carp, and it is just that the impression should be corrected, if it be wrong, that the carp is cleaning out the bass. Personally I hear from other sources that the carp are ruining some waters, such as the Kankakee River, which Mr. Cohen mentions, once a grand bass water, and now spoken of as continually muddy from the stirring up by the multitudes of carp. I can not tell how true this report may be, and think the ditching of the river at certain points may have something to do with its roily condition. Not that I love the carp, even after Mr. Cohen's encouraging comment upon him, which, of course, he is in position to make under his own observation, and with authority. He says:

There has been no time in the history of the Illinois Fish Commission that black bass has been so abundant. The year will prove that carp is not so destructive to our game fishes as the majority of people have been led to believe. On the contrary, they have supplied food for the enormous amount of bass that the present year will produce. The commission has been at work for thirty days, and have averaged over 2,500 bass a day, and could have taken more if the capacity of our boat would permit. Every pond, lake and bayou tributary to the Illinois River is filled with this year's bass, and if all could be taken at the proper time they would supply the United States. The commission has so far distributed 50,000 fish, not fry. These bass are from 2 to 6in. in length, able to take care of themselves, and some are ready to take the hook. If nothing prevents, and the ponds do not evaporate too soon, we expect to gather 500,000 this year. U. S. Commission Car No. 3 will take from the hatchery at Meredosia 10,000 bass, to be planted in the Kankakee River at Custer Park. Over twenty plants have been made in central and southern Illinois this season. The lakes of the northern part will be supplied later. The commission feels gratified in having been able to accomplish so much work, and with such promise of great results.

We took 30,000 out of one pond with only 14in. of water in it, and it would have gone dry in two weeks. We have several other locations that are equally as prolific. I send you this statement for two reasons, first, to let you know that there are more bass this year than for twenty years. Some of them are as long as yearlings.

We are not trying to stock any more streams with carp, but the public should know that they are not quite as black as they are painted.

Wisconsin Fish.

Fay Buck writes me from his Divide Resort, Manitowish, Wis.:

"Mr. Lampson and friend, from Columbus, Ohio, landed 182 black bass, 27 weighing over 3lbs. The fishing this summer has been good. July is not a very good month for muscallunge, but we have landed quite a number weighing from 10 to 15lbs."

Tuna Club.

The Tuna Club, of Los Angeles, Cal., has twenty-four members, each of whom has taken a tuna weighing over 100lbs. The club is contemplating putting up handsome medals for record fish, first, second and third, these to be awarded next season. The tuna records are to be kept in a regular record book.

Tarpon Club.

The Tarpon Club, of Texas, organized last winter, and mentioned at the time in FOREST AND STREAM, now has over 300 members, and applications which would run the list up to over 400 if all were admitted. The elaborate club house at Aransas Pass is in advanced state of construction. Our sleepy old village of Rockport, Texas, is going to be spoiled by becoming fashionable, I am afraid.

Ohio Fish Commission.

Fish Commissioner Fallon and State Warden Reutinger, of Ohio, last week made a royal tour in the official car, coming over into the State of Indiana, where they spent some days looking into the methods of the State hatchery of Indiana. They were well entertained, and expressed themselves as pleased with the trip.

Kentucky Anglers.

A special sleeping car carried a large angling party from Louisville, Ky., early this week, members of the Kaintuck Club, who were bound for Magnetawan, Can., for a long camping trip, which surely ought to be a pleasant one. The following gentlemen were of the aggregation: Judge T. L. Burnett, Judge Emmet Field, Judge J. C. Dodd, Dr. C. W. Kelly, R. B. Thomas, R. H. Blain, S. T. Jones, J. C. Durrett, John S. Jackman, E. F. Camp, E. S. Monahan, E. H. French, J. E. O'Bryan, E. H. Hewett, W. M. Smith, J. C. Burnett, J. D. Loughridge and C. C. Early.

Good Bass Fishing.

I hear of two points this week which are affording good bass fishing. One is La Crosse, Wis., on the Mississippi River, always very well worth keeping in mind by any bass angler. The second place is at the La Grange dam on the Illinois River, where the bass fishing is extraordinary. The Fish Commission of the State are to be accredited with this latter fact. Mr. Frederick N. Peck, a newspaper man of Chicago, starts this week for Helena, Mont., where he will join friends and have an extended trouting trip.

E. HOUGH.

1240 BOYCE BUILDING, Chicago, Ill.

Santa Catalina Island Tuna Club.

AVALON, Cal., July 29.—The intense interest among anglers in the leaping tuna, who have visited the island of Santa Catalina to enjoy the sport of taking one of these fish, has resulted in the formation of a tuna club, the object of which is to discourage hand-line fishing and to reduce the sport to an exact science.

A result is already seen in the fact that but one or two tunas have been taken this season by hand-liners, while hundreds have been hooked with rods—nearly all breaking away, owing mainly to the inexperience of the fisherman or the "tuna fever" into which the novice is thrown by the gallant rush and fight of this king of fishes.

The Tuna Club is a close corporation, and apparently very select; having but twenty-four members—but it can be said that every man has earned his membership. The requirements are that every member shall have taken a 100lb. tuna with a fairly light rod and a line not larger than a 21 strand or thread Cuttyhunk. So far but twenty-four members have qualified and there is a remarkably large waiting list. The president is the angler who takes the heaviest fish, and he holds office until he is defeated. The first vice-president is the member who takes the greatest number in a season. Then come the members in the order of their weight rank, all being vice-presidents. The club offers a gold medal which is fished for each season, but remains the property of the club. This is for the largest fish, and there are second and third medals, to be held by the second and third catches. The list of members to date is as follows:

	Pounds.
June 1, 1898, C. F. Holder, president, Pasadena	183
June 25, 1898, S. S. Fraser, San Francisco	176
June 3, 1898, W. M. Rockwell, Redlands	168
June 19, 1898, W. F. Loud, Pomona	156
August, 1896, Col. C. P. Morehouse, Pasadena	150
June 22, 1898, E. L. Doran, Los Angeles	153
July 28, 1897, Greer Campbell, New York	140
June 15, 1898, M. C. Arnott, Elmira	148
July, 1898, W. J. Landers, San Francisco	138
July, 1898, Dr. H. K. Macomber, Pasadena	137
July 1898, Fitch Dewey, Detroit	136
July, 1898, C. R. Scudder, St. Louis	130
July, 1898, J. G. Chapman, New York	129½
July, 1896, H. A. Vachall, London	125
F. E. Brett, Mankato	120
W. S. Goodfellow, San Francisco	116
J. M. Studebaker, South Bend	115
E. A. Doran, Los Angeles	110
Thos. S. Manning, Philadelphia	105
H. L. Loomis, Los Angeles	105
F. V. Rider, New York	103
P. H. McMahon, Randsburgh	103
Nat F. Wilshire, Los Angeles	102
C. A. Wucomin, Los Angeles	101

Mr. E. L. Doran is the first vice-president, having taken sixteen fish in the season, and several others have taken four or five, but all base their membership on one fish.

My letter to FOREST AND STREAM has occasioned so many inquiries from fishermen that I may perhaps add a few additional notes on the tuna. The fish is probably identical with *Orcynus thynnus* of the Atlantic; but owing to the fact that its prey is the large California flying fish, its habits are different; in other words, it is a remarkable leaper, not only after it is hooked, but at all times. It will bound 10 or 15ft. into the air. I have seen it strike a flying fish in the air; and a reliable boatman in casting had a tuna leap from the water and seize the bait in the air before it struck. They have been known to leap over boats, and I have retreated before a large school that were leaping, fearing that one might land in the boat and go through it; a very easy matter.

We troll for the fish within 100 or 200ft. of the rocky shores of the island, calling to mind the bass grounds of the St. Lawrence, only here the water is extremely deep a few feet from shore. The fish lie off shore at midday, coming in in the early morning; best fishing being from daylight until 8 or 9, and from 3 P. M. until 8 at night.

The season may be said to be from May or possibly April until November—June being in my experience the best month. The fish stop biting as a rule at the full moon and stop mysteriously at other times. At about July 15 there is a decided falling off in catches, but I am confident that this is due to the roving character of the tunas, and they are caught from fast launches at all times. A launch is not necessary. Some of the finest catches are made from boats slowly moving. But behind a launch the fisherman covers more ground. The bait used is a large 16in. flying fish. The tuna strikes at full speed and at the eye of the fish, so that the killing hook should be here. Some leap into the air and come down upon the bait; others come boiling along at the surface and generally two are together.

I agree with Mr. Beard, who faithfully fished for the tuna, that it is the "game fish" of the world, well deserving the encomiums he has given it. In this connection it is interesting to note the effect of the fish upon anglers. The average man in my experience is helpless in from ten to thirty minutes with his first fish, and almost invariably loses it. Some I have seen are utterly exhausted in ten minutes, partly from physical exhaustion and partly from the nervous strain. After fighting my 183lb. fish four hours I was almost completely exhausted, and for a week suffered from the strain. With the second and third catches it is different. One profits by the remarkable experience, yet two-thirds of the fish hooked escaped from skilled members of the Tuna Club, due I think to the fact that during the intense excitement of the rushes, too much force is put upon the brake, and the thread-like line parts. In former years I lost scores of these fish before I learned that the friction of the brake burnt the line—now the first move is to wet the line and brake.

As to reels and rods, Julius and Edwin Vom Hofe, of New York, both make the ideal tuna reel, and the only one obtainable here that will withstand the terrible strain. The reel should should be large enough to hold 900ft. of wet 21-strand line. In rods, any good striped bass rod will serve the purpose. What is known as an ironwood bass rod is used, also the noibewood bass rod, or Hall bass rod. I have found particularly adapted for the sport a heavy 16oz. split bamboo. In lines the Cuttyhunk is the most enduring in my experience. My large tuna, the record fish, was taken on one of these lines, the fish towing a heavy boat by it against my boatman's oars for at least ten miles. I do not know the maker's name, but the test was a tribute to his tackle. On such tackle (rod and reel) a member of the Tuna Club has at the present writing landed a 327lb. black sea bass, bringing the fish to gaff in fifty-five minutes.

CHAS. F. HOLDER.

Boston Anglers.

BOSTON, Aug. 5.—Salt-water fishing is increasing in popularity among merchants and business men. Buzzard's Bay is popular, though regarded as uncertain; but sometimes giving excellent results. Two gentlemen of the wool trade, and a well-known newspaper proprietor (their names I am not at liberty to use), were on Buzzard's Bay the other day, for scup and tautog. The fishing was not of the best, the day being very hot. It was proposed to go over and call on Joseph Jefferson, the renowned personification of Rip Van Winkle, as well as lover of the angle. They were most graciously received and handsomely entertained, because they were fishermen. Two of the Cleveland children were at Mr. Jefferson's cottage, and the sportsmen had a good look at a couple of good, healthy babies, without any sort of "flummery" or useless formality. Mr. Jefferson has an ideal cottage and establishment. His pictures are worth many thousands of dollars. In one door he has a transparency of Booth, and in another one of William Warren. He delights in fishing; fishes almost every day, in fact, when the weather permits. The next morning after this visit the Boston sportsmen received a basket of trout, with the compliments of Mr. Jefferson.

Mr. L. Dana Chapman is back from another trip to the preserve of the Megantic Club. The club is well patronized this season. There are twenty-eight people at Big Island Pond, nine at Chain of Ponds, and twelve at the main club house. The fishing has not been good at Big Island Pond of late, doubtless by reason of the extremely hot weather. At the main club house, Megantic Lake, the bass fishing has been excellent. In one day twenty-seven bass were taken by one party, the largest weighing 6lbs.—a remarkably large fish. Another day fourteen bass were taken by another lucky party. Deer are remarkably plenty, and are well protected, the club having wardens, whom everybody respects. Partridges are also plenty, which is remarkable, considering the scarcity of these game birds in other parts of the State. Prospects for fall shooting are excellent.

A Fish Pays a Church Debt.

Aug. 8.—The salmon fishermen continue to return. Generally the late fishing has been scarcely fair in the New Brunswick and Quebec waters. Messrs. Robert Bacon, of New York, and Gorham Peters, of Boston, are back from the Grand Cascapedia. They had only fair fishing, with a good deal of extremely hot weather. The Dumaresq party is back from the Dawson Pool at the Restigouche. In the party were Messrs. Herbert Dumaresq, T. R. Hoyt and L. R. Howe. These gentlemen control the celebrated Dawson Pool. They had moderately good fishing, getting seven salmon each. Still there was a good deal of the time when the fishing was very poor, and anything reasonable was done to keep up the interest. Old gentleman Dawson, for whom the pool was named, lives there with his wife and guards the fishing interests zealously. A little church stands in the town, in which both he and his wife are interested. On the meeting house was a debt that has hung like a deadly incubus for some time. Though but $100, it has troubled the good people a great deal. The sum is a large one for the good folks of that country. Mr. Herbert Dumaresq registered a vow one day that if he should take a salmon of 29lbs. he would pay the church debt. Little did he think that the good fish of the pool might be on the side of the church. The next day he went a-fishing and soon hooked a monster. After a tremendous struggle the fish was landed, and behold it weighed 36lbs., and was borne in triumph on a board up to the little town. Mr. Dumaresq was prompt in lifting the church debt, and Mother Dawson and the other mothers of the little church declared, with tears of gratitude in their eyes, that "The Lord sent that fish!" But the sportsmen have another reckoning with Mr. Dumaresq as they tender their congratulations. They tell him that he owes that little church seven more contributions for his promise was registered at 29lbs., but the fish weighed 36lbs. At any rate, it was the biggest fish of the trip, and one of the biggest of the season in any waters, and Mr. Dumaresq, real sportsmen that he is, is greatly pleased.

SPECIAL.

Great Fishing off the New Jersey Shore.

ASBURY PARK, N. J., Aug. 7.—Coast fishing has developed all that was predicted earlier in the season. From all points come the most encouraging details. Every stream along the coast is productive of the best fishing, while the ocean proper is prolific of fish life. Strange as it may seem, the ebb tide is now the most productive of results. While the striped bass have given the angler the go-by, still the weakfish and kingfish are extremely abundant, and every day and night bring good results to the angler of experience.

A most important matter is now claiming the attention of all anglers. A fish locally termed the croaker is taking the hook freely about one mile at sea. As the description of the fish does not agree with the description of that fish as properly known, I have offered a special price for a specimen, so that the matter may be satisfactorily settled. A description of the fish, together with memoranda of baits, etc., will be given in the columns of FOREST AND STREAM in a later issue. The absence of pound nets has re-established our old-time fishing, and to all who enjoy a catch either in the ocean or estuary I would say the time is now ripe, and will so continue until Oct. 1.

LEONARD HULIT.

Mahopac Bass.

THE largest black bass taken this season from Lake Mahopac, New York, was caught by Mr. Clifford P. Lukens, of New York city, in the last week in July. It measured 21½in. and weiged 5½lbs.

Reminiscences of an Old Sportsman.—XIV.

The Willington covers that I have mentioned were, in the good old days, a very paradise for the sportsman who was familiar with the many nooks and corners loved by the birds. But to the stranger it was often nearly barren ground, for the most likely looking spots, with few exceptions, were not the chosen haunts of the game. I well remember a most inviting bit of alder cover that bordered a meadow through which ran a little brook, but no birds were ever found here. I have worked out the ground nearly every time I have been in the vicinity, but always with the same result, and often have I resolved that I would never try it again, but as a well-known sportsman has written, "Hope springs eternal in the human breast." My eyes no sooner caught sight of the spreading alders, with the wealth of waving ferns and emerald grassy nooks spread so lavishly beneath, than with renewed hope the dogs were given the word and again would we thread the beautiful aisles in perfect confidence that this time we would surely find them at home. But, I regret to say, the only result was renewed resolve that we would never again be tempted to explore the beautiful but illusive place.

About a quarter of a mile beyond this charming spot was a patch of about an acre that, so far as looks were concerned, held out no inducement whatever for the sportsman to explore it. The cover was of straggling growth, interspersed with thorns and briers, while the ground was fully one-half covered with stones, making a very uninviting looking place to search for birds, but they were there nevertheless, and we have often brought to bag a full dozen woodcock in this most unpromising spot.

The very cream of the whole of the extensive range of covers was the old "chaparral," as it was called by the select few who had the good fortune to share with my old friend, Fred Eaton, the pleasure of exploring the many nooks and corners of this sure abiding place of the shy woodcock. I shall never forget my first two visits to the delightful resort. Although nearly a half-century has passed, those two delightful days of royal sport still bring to me bright memories of the good old times, and fond recollections of my life-long friend. I had met Mr. Eaton the previous June on the banks of a trout stream, and somehow we took to each other, although he was a man of middle age, while I was only a boy. He promised to be at my home the evening of Oct. 9, so that we could take an early start the next morning, for he assured me that the 10th was the day of days for woodcock, as he had abundantly proven by his experience in the past twenty years. At last the longed for day arrived, and just at dusk Mr. Eaton came, and we were soon seated in front of the old-fashioned fireplace, where we remained until nearly midnight fighting our battles over again and comparing notes regarding the game supply in the different localities with which we were respectively acquainted. He could devote only a few days each season to his favorite sport, and nearly all of his shooting was over grounds that were comparatively well known, for he could not afford the time to investigate unknown covers; but the Willington country he had discovered some years previously while trouting, and he took no little pride that so rich a domain was all his own. We started a few minutes past 1 o'clock, and arrived at Mr. Eaton's usual stopping place shortly after 5 o'clock. Our genial host, Mr. Dolly, and his wife met us at the door with hearty welcome, and before we had returned from taking care of our horse the good dame called us in to breakfast.

Shortly after sunrise we were on our way to the chaparral, which lay a short distance below the house, rather a straggling looking cover with an occasional poplar some 20 to 30ft. in height, a few large clumps of birches and stray clusters of scrub oak, the whole surrounded and connected by a smaller growth of birch and witch hazel, making a fairly good looking cover, but one that came far short of what I had been led to expect. I said nothing to this effect, however, for which I was soon profoundly thankful. My dog came to a point just as he was about to enter the cover, and when I went around to drive the bird outside no less than four of the beauties rose nearly at the same instant, and about three seconds later every one of them was back to earth again. Somehow I had taken it for granted that Eaton could shoot, and I had no fears concerning my own performance, for I had taken my degree as a snap shot two years before, but Eaton, as he afterward told me, had doubts that a boy could acquit himself even fairly well among the birds, but this rather difficult double set that matter at rest, and a satisfied look spread over his smiling face as he tersely ejaculated "good boy." This was my first introduction to the chaparral, and long before we had explored its many nooks and corners I had nearly as much love for the dear old place as Eaton, for we found an abundance of woodcock, and enjoyed ourselves as only a sportsman can when, with congenial companions, a perfect day and abundant sport, he adds one more red-letter day to the list he so fondly recalls as the years pass by. Hallowed memories these, that weary tramps and days of unsuccessful sport only serve to brighten and make more dear. This was in truth a red-letter day to us. Mr. Eaton was just my ideal for a shooting companion, and I judged from his appearance as well as the expressions of satisfaction that fell from his lips that he was well pleased with me. After we had worked out the cover we returned to the house, smoothed the plumage of our birds—there were sixty-three of them—and feasted our eyes upon the goodly array.

Upon comparing notes we found that this beat, by several birds, all previous records that either of us had made. Eaton had only one day off and we were forced to return, much against inclination, for we had seen during the day quite an extensive tract of good looking country that we were anxious to explore. We agreed, however, that we would visit the old chaparral the next season upon the same date, and make arrangement for plenty of time to look over other covers in the vicinity.

The anniversary of our three score and three day, as Eaton called it, found us again entering the cover before the sun was far above the horizon, and again we found the birds at home, for when we took account of stock we counted fifty-nine. Mr. Dolly rated us soundly for this falling off, and at his suggestion we returned to the cover and beat out a small patch which we had not explored. This patch of about two acres was really a portion of the chaparral, as it was only across the road from this cover. We soon secured the four birds necessary to tie our previous score, and without trying for more we returned to the house, for Eaton said that we should both be more pained than pleased to have the score wiped out that had afforded us so much pleasure during the past year. Not only this, but in the years to come, when the memory of these glorious days should come to cheer us, there would be an added charm in the thought that by staying our hands we now would have two of them instead of only one.

We had upon this trip decided to explore some of the very inviting looking country in this vicinity, so the next morning we took an easterly course in the direction of quite an extensive tract of alder and birch covers, which we worked out thoroughly; then swinging north, beat all the covers within our range until it was time for lunch, after which we turned west, and at sunset found ourselves upon the hillside above, and only a short distance from our starting point. We had worked over much barren ground, but upon the whole were well pleased with our success, for we had found quite a number of corners and little runs where birds were fairly abundant, and had learned the places to avoid when next we came here.

Shall New York have Trials?

Editor Forest and Stream:

Why cannot New York State have its field trial? With as many thorough sportsmen and good dogs as there are in our State it would seem as if a field trial would be supported. Many of us who dearly love our dogs and the sport of seeing them "tried out" cannot afford the time and money that it takes to go South to attend the trials now on the calendar. Then too many of our State dogs are broken for such shooting as we enjoy in New York, Connecticut, and New Jersey, and would not do for the fast Southern work, while they would give a good account of themselves where hunting to the gun and all that goes to make up a first-class shooting dog would be considered.

I was one of the original six who, under the direction of Mr. Jacob Pentz—then connected with the Turf, Field and Farm—organized the Eastern Field Trials Club, took the best dogs we had at hand, went down to Robbin's Island and held the first trial of the club. I remember my black and white setter bitch Daisy divided third with one of Dr. Fleet Spear's dogs, and we had a grand good time all around. The little town of New Suffolk made us very welcome, and we went there again two or three years until the club outgrew its use for Robbin's Island and moved its trials south. A large number of the original members quit the club at that time, and I have never heard of a club in this State since. We had some delightful days at those first meetings of the E. F. T. Club. Some time I must write you two or three articles on the happenings at the first trials and of some of the grand sportsmen that enjoyed them, and how the first lady attending a field trial came to get there.

But I am drifting. Why cannot we have another club and hold a trial that shall determine which is the best hunting dog, as we want dogs to hunt here in our State, where speed shall not be the winning card, but where the dog that hunts best to the gun, is obedient with the least noise from his handler, that takes all sorts of ground with dash and without fear, that is stanch in the briers as well as in the open, and that shall retrieve nicely, shall be the dog to take home the "blue." Of course he must have speed, but it must be educated speed controlled by the knowledge of the work he is at and the pleasure of his handler. He must be a dog that will go out and stay out so long as is required of him, and go just where he is directed.

I believe a State club could be gotten together on these lines, and I also believe that a first-class place could be had for holding the trials.

Gardiner's Island, on Gardiner's Bay, eastern end of Long Island, would be a grand place if arrangements could be made for the trials there. It has been my privilege twice within the last few years to go to Gardiner's Island, and Mr. Lionel Gardiner, the thirteenth (I believe) descendant and owner of this beautiful island, is a fine gentleman and a grand host. The last time I was yachting in these waters, coming down from Greenport through Plum Gut, I noticed Mr. Schermerhorn's big steam yacht lying off Gardiner's Island, and was told he had leased the shooting privilege of the island. As to this being correct I do not know; but either gentleman might be willing to give the club the privilege of a few days on the island, especially as no birds to speak of would be killed. The last time I was on the island, on passing from one meadow to another to look at some of Mr. Gardiner's fine colts, we started bevy after bevy of quail, leaving no question but what there would be an abundance of birds. This would be an ideal spot for a trial if it could be had. We would be obliged to stay at the nearest point across the bay on Long Island shore and go to and fro by boat; but this could easily be arranged for, and a suitable boat could be had probably at small cost, besides making a delightful little variation in the usual routine of the trials. If this place could not be had—and I have not reason to think it could other than I know that it is in the hands of gentlemen and I believe thoroughly good sportsmen—there are other club preserves on Long Island that might be obtained. It would at least be worth a trying to locate a place if the idea seems to meet with approval. If we find it does I shall be pleased to give you my ideas as to what would be required of the judges, dogs, and also of the members, to make the trials a success—one of value to us all in bringing out the best dogs for our shooting, and the greatest amount of good clean sport. Your valuable paper could do much toward the club's success. E. A. Spooner.

New York, July 25.

A Missouri Fox Chase.

Pittsfield, Mass.—*Editor Forest and Stream:* Among my papers I have come upon this letter from Daniel Morris to Ensign M. Smith, both of Missouri. I have accompanied these two genial and enthusiastic sportsmen and hunters upon several very enjoyable hunting trips in the Southwest. I send the letter, thinking you may consider it of sufficient interest for publication.

Frank Paddock.

On our wolf chase we had one of the finest days of sport I ever put in in southeast Missouri. The famous Jake Davison and myself left Poplar Bluff about 9 P. M. Tuesday, the 17th, horseback, with the noted thirteen, which were quite anxious for a chase after anything that would even try to make an escape from them. Everything went quite well except now and then a dash by the entire pack at some scent which by chance may have been left by some varmint near the roadside; but by keeping a close lookout and using some sharp talk to Mr. Snort and Miss Gay, with now and then a little of another kind to old Drive, as you are aware he has quite tender feelings, we managed to arrive at the end of the journey, where we went into quarters until 7 A. M., when Miss Gay woke me by letting me know that it was quite time to be out. Up I got and seized my old ram's horn and gave it a sound that caused the little dog to think I was off, and in she came. By a little sweet talk the dogs were persuaded to stay until a few moments before 8, when here came the Ham delegation, about fifteen, with as many dogs. Some five or six others joined in, and we were all soon mounted and off toward the wolf den. As I had been there before, the crowd looked to me to guide the hunt, and so I did. After we had gone down the rock road I advised the party about how I thought the wolves would run if we should find them where they were before; so the men all did fine; every man held his place until the signal was given to reassemble. Myself and young Ham, with two others, filed off to the left on top of the hill, where the wolves were having a good repose, doubtless from the exercise taken the night before.

Every now and then I would talk a little to the dogs. Snort wanted a deer chase. I had to scold him. All at once there was a break and a dash, and of all the yelling I ever heard the best took place about this time. Every dog seemed to know what was up. There was no drawback in any of the dogs. Everyone went in with a vim. One would have thought the noted thirteen were trained to do this kind of work; but I give the Ham dogs the credit for the start. They all did well. About fifteen minutes, and bang! went a gun, and in ten minutes more bang! went the second shot, and five minutes more bang! went the third shot. It was now evident that something was hurt, as two of the three shots were from double-barreled shotguns: one in the hands of old man Ham and the other in the hands of old man Tucker. This was sufficient to draw myself and men toward the rock road, where the men were stationed, and to my wonder and surprise every man was at his post, ready for any emergency at or near his stand. This spoke well for the men and was very encouraging to me.

I waited a few moments, and lo and behold! we heard the sound of a horn. In response, I sounded the old ram's horn, which I sometimes carry on such occasions. This was sufficient to all the men to come: and they did so in haste. Old man Ham, "I mean the Representative Ham," was the lucky man. He had killed one wolf.

The next thing in order was to get the dogs and horses to water, so we marched in double file to Indian Creek and were cooling off to the pleasure of all the dogs, "for it was very hot," when to my wonder and surprise just across the creek there was a voice, and lo and behold, it was old man Tucker, and he hallooed out: "Boys, I have killed one wolf and wounded the old bitch, and devil take the luck, if my horse did not throw me: the first time she ever did such a thing in my life, but I got it, boys: here is the hide. Your dogs scared it and one red dog was running them when they come down this way, and I just took this one in."

It was now near noon, and we all took over one hour's rest, during which time the crowd managed to tell a few wolf stories, and at the same time several of the men had brought a lunch along and there was plenty for every one to eat and be happy. P. M. 1:30 I commanded: "Now, men, let us cross over the creek where Tucker wounded the old bitch, and see if we can't start her up all right. All ready? Here goes! Look out! do not shoot anything only what you shoot at."

On we went across the creek all in abreast, only some 300yds., and: "Hold up boys, that dog smells a wolf! Go, Snort!" Bow, wow, wow, went fifteen or twenty dogs all about the same time. Bang went a rifle; fifteen or twenty men all brought a yell, and of all the fine running you ever saw, and of all the nice voices of dogs, fully thirty dogs all going at once, excited by the voices of so many men, together with the report of the rifle, which had been fired by one of our party, only to miss the wolf, but to give the dogs the start, which proved to be the finest race which ever took place in this

country. Away they went up the creek, over the hill, across the country toward the railroad, clear out of hearing. To follow was suicidal, so myself and Mr. Ham just stood still for more than thirty minutes, when, "Hush! do you hear them? Hush! they are coming back this way. Don't you hear them?" "Yes, I do," says the old man, and in less than ten minutes they came in sight of us, nearer and nearer, every dog to his work. Never was there such wakening times in this woods.

"Just listen! Don't they run? Here they come! Look, old man! Don't let him cross up there! Here they come! Here they come! Here they come!"

Old man Tucker just over the creek brought a squall; but it was too late. Little Gay had nipped the wolf in the flank, and the devilish thing turned to retaliate, only to face old Drive and two black dogs belonging to Ham. I was there myself to see the dogs string him out and see the other dogs come in, one, two, three at a time, until all the dogs were there. Every one would give the wolf a shake as they came in, and by the time they were all through the wolf was quite dead. While this was going on one man, who had gone up the creek to follow the dogs while they were running, dropped another wolf, which was trying to steal away from the report of so many dogs. The horn was sounded, and the men all came in to witness what had taken place, to the satisfaction of all concerned.

17. American, cruise to Plum Island.
17. Baltimore, Rear-Com. cup, Chesapeake Bay.
17. Queen City, 22ft. K class, Toronto.
26. Newport, ladies' day, Narrangansett Bay.
29. Miramichi, Gould cup, Newcastle.
30. Taunton, ladies' day, Taunton, Mass.

OCTOBER.

14. Miramichi, Watt cup, Chatham.

THE certainty of a challenge from the owner of a new 90ft. cutter has put to rest with many others of its kind the silly story that the new schooner Rainbow was built to challenge for the America Cup. As this came from the Boston fiction factory, and had absolutely nothing but ignorant conjecture to support it, we have never taken the trouble to deny it; but the one fact that the new yacht is built to rate 20A1 at Lloyds is enough to demolish this carefully constructed fake as thoroughly as an American steam yacht would a torpedo boat destroyer. No yacht which is classed at Lloyds can win the America Cup under existing conditions, and no British yachtsman is such a fool as to try the experiment.

ON Saturday of this week the first race of the international series for the Seawanhaka cup takes place, on Lake St. Louis, Montreal; the defender being the Royal St. Lawrence Y. C., and the challenger the Seawanhaka Corinthian Y. C. The former is represented by G. Herrick Duggan, the winner of the cup at Oyster Bay in 1896, and the latter by Clinton H. Crane, the winner of the Seawanhaka trial races in 1896-7-8. The competing yachts are not yet known; Mr. Duggan has for the defense the successful Glencairn II. of last season, and four new boats of his design. The third of these, the one which he has sailed in the trial races, has just been named Dominion by her owner, Com. James Ross. She is, from all accounts, a double-hulled craft, a complete innovation in these races. The final selection will be made from the entire fleet, presumably one of the three new boats. Mr. Crane has two boats at Montreal, Seawanhaka, winner of the trial races, owned by the Seawanhaka syndicate, and an entirely new boat, just completed by the Spalding St. Lawrence Boat Company, and shipped down from Ogdensburg to Montreal, where he has joined the two. The new boat is owned by him, in connection with his father and a third owner. The challenger will be selected from the two prior to next Friday night.

The contest this year promises to be more even and more interesting than that of last year; Mr. Crane has profited a great deal by the experience of two seasons, especially by the actual racing on Lake St. Louis last year, and he shows a marked improvement in his work, both in designing and handling. Just what progress Mr. Duggan has made cannot be known until his new boat is on view, as from the reports he has evidently tried a radical experiment.

The races will be sailed under the same general arrangements and conditions as last year. Yachtsmen who may visit Montreal will find the club steamer at Lachine, four miles from the city, and easily reached by rail; the accommodations at Dorval, nine miles out, are limited to the yacht club house, and that will be filled by the members and those immediately connected with the races, so that others will have to depend on the hotels in Montreal. The trip to Montreal is a pleasant one, and those who make it are little likely to be disappointed; the sailing is even keener in these small craft than in large yachts, and from the reduced proportions of the course the boats may be followed throughout every moment of the race, while with a glass even the personal work of each member of the crew may be closely scrutinized. Only those who have watched both understand the added interest in this sort of racing compared with that of large yachts, which are of necessity seen only at intervals and imperfectly. Save in mere area of canvas, the small craft are in every way as interesting as the large ones, and even faster in proportion to their size.

THE Western Sports, of San Francisco, is doing good work in the direction of the abolition of time allowance, as already accomplished by the Y. R. A. of Massachusetts, and in part by the Y. R. A. of Long Island Sound. As a preliminary to this, however, it is absolutely essential that there shall be some established classes under a good measurement rule, to which men can build with some degree of protection from the racing machine and immediate out-building. Excellent as it is in itself, the mere abolition of time allowance has no effect whatever on type or form, and some restrictive rule is necessary unless each class is to be turned over to the freaks as soon as the racing in it becomes at all interesting.

POOR Britannia! At his examination on Aug. 1, in London, Mr. Ernest Terah Hooley, ex-promoter, testified that after he had purchased the cutter Britannia from the Prince of Wales for his associate, Mr. John Lawson Johnstone, he had been compelled to keep her himself, because she did not come up to Mr. Johnstone's expectations; which, it has been said by the way, were that she was a steam yacht. And yet Mr. Johnstone has figured in English journals as a yachtsman, and even attained the dignity of having his biography, with favorable mention of his proprietary specific, cabled across the ocean as that of a possible challenger for the America Cup. Mr. Hooley's revelations as to payment of money to men of all classes, from editors to earls, is amusing and instructive as to the true inwardness of the up-to-date business man and his methods.

AN unverified report comes from the other side to the effect that Mr. A. J. Drexel, of Philadelphia, who has just sold his steam yacht Margarita to the King of Belgium, is negotiating for Valkyrie III., with the intention of bringing her to America. Should there be trial races in the 90ft. special class next year, the presence of Valkyrie III. alongside of Defender and a new defender would add materially to the interest in the races, as it was very plain that, as matters went, the yacht was never shown at her best in her two trials in this country in 1895. At the same time, the mischievous Payne bill stands in the way of such an experiment. Another report, which is more likely to be true, has it that Mr. Drexel will build a still larger steam yacht than Margarita.

The Measurement Rule.

IN the FOREST AND STREAM of July 16 appeared a long and interesting criticism of the recent report of the Seawanhaka special committee by our correspondent Sextant, whose views on the measurement question are well known to our readers. Covering as it does a large number of points, this letter is by no means easy to answer within reasonable limits of space; and the many demands on our time during the racing season have thus far prevented even the attempt. Without presuming to speak in any way for the committee, we shall try to make clear some of the views held by those opposed to Sextant and Mr. Hill in the matter of the general principles of measurement, as well as some points dealing with specific details.

Near the end of Sextant's letter we find the following, by way of summary of the points made by him against the report: "The notable omissions in the report are the failure to discuss fundamental principles of measurement, and the absence of any attempt to justify the adoption of the proposed formula and to demonstrate its usefulness. Yachtsmen are practically asked to adopt it on faith, as they have so many others which have proved useless." Taking up the first of these points, relating to the fundamental principles of measurement, Sextant will probably agree with us in giving the first place to the broad issue between the two types of measurement rule: the "old type," such as the Seawanhaka and the present Y. R. A. linear rating rules, composed of variable factors, and the type advocated by himself and Mr. Hill, with arbitrary and fixed limits.

The consensus of opinion throughout the yachting world to-day is so strongly in favor of the former as, in the opinion of many, to render any further discussion of this question unnecessary. This type of rule has been in use from the earliest days of yacht racing, and if we follow the measurement question back year by year for half a century we shall still find the one idea expressed by practically all disputants, of measuring the "size" of racing yachts by summation of certain variable components. There is no end to the differences of opinion as to what should constitute "size" and what the factors and constants should be; but there is a general agreement on the suitability of this type of rule.

While this type of rule is in universal use to-day in America, Great Britain, France, Germany, Denmark, Norway, and Sweden, and while nearly all who are working for the improvement of measurement rule have accepted it as the basis for their investigations, the other type, the rule based solely on arbitrary restrictions, is not in use as a general rule, nor has it any number of supporters. It is true that of late years, and in consequence of the patent failures of many formulas of the old type, numerous classes have been established under arbitrary limitations of "one-design," or certain tabulated restrictions, and with good success in the majority of cases. At the same time there is no important yachting body which has yet discarded its general formula, of the old type, to replace it with a restrictive rule, or rather a series of restrictive rules, to cover all its classes. Such work as has been done in the direction of arbitrary restrictions has been special and supplementary, and not primary and original.

The Seawanhaka Corinthian Y. C. has in the past two years encouraged a thorough discussion of the entire measurement question at its regular club meetings, at special meetings of men known to be interested in the matter, by the reports of its race committee and by letters to different yachtsmen. In this general canvassing of the whole subject, bringing out a great variety of views, there has been no demand whatever for a change from the old type of formula. It may be fairly assumed that this fact, with the knowledge of the general feeling of foreign yachtsmen, has influenced the late special committee in limiting its labors to the field of the existing type, of a formula composed of variable components.

The strongest argument which can be made against the formula type of rule and in favor of the restrictive type is that the former has repeatedly failed, while the latter has in many cases proved successful. This argument has been advanced by some of the Boston yachtsmen, who are opposed to the present Seawanhaka rule, as compared with the Massachusetts Y. R. A. rule of simple L.W.L., but are willing to consider a proposal for the general adoption of restrictive rules. To us it is a very weak one, for the two reasons that the cause of the failure of the old type of formula is in every case so plainly obvious, and the success of the restricted classes is under special conditions, which will not exist under a general application of the restrictive plan to all classes, with no other rule.

Our correspondent disposes briefly of the matter by the preamble, "In view of the failure of all rules of the old type," but we would reply that all such rules have not failed from the outset, but some of them have worked very satisfactorily for years, only failing when, through advance in design, construction, etc., they have been put to the test of entirely different conditions.

The Seawanhaka rule, adopted in 1883, was an excellent rule, and was direct and positive in its results, producing a better type of yacht than either of its immediate predecessors, the old New York Y. C. "cubic contents" rule on the one hand, and the British "tonnage" rule on the other. From 1883 to 1891 its influence was beneficial; as long as no inducement existed to cut down the area of the midship section while retaining extreme dimensions for the sake of the untaxed levers, beam and draft. As soon as the fin-keel came in, through causes not necessary to discuss at present, the rule failed. The reason for its failure was not because it was based upon variable factors, or even because false values were alloted to those factors; but because it did not include other factors made necessary by the course of designing. In the same way the British rating rule was a complete success for about five years, and it cannot yet be said beyond question that existing rules, the Y. R. A., the German and French rules, are failures; or that such defects as they may have are beyond remedy by a judicious readjustment of factors and constants.

To any one familiar with the progress of measurement legislation the world over the reasons for the failures of formulas in the past must be perfectly evident. They rest entirely with the yachting public, which either has not wanted other than racing machines, has not known what it wanted, or when it has wanted the right thing has not known how to get it, or has been opposed by vested interests. In too many cases yachtsmen have wanted absolute speed at whatever cost, and have successfully opposed the minority, who have seen the inevitable result of such a course, the present condition of yacht racing in this country. In many cases yachtsmen have started out bravely enough to amend existing rules so as to produce the much-talked-of "wholesome boat;" they have even gone so far as to listen carefully to those most familiar with the subject and to do some independent thinking, until they have

arrived at an intelligent understanding of the existing conditions, the prospect of the future, and the possible remedy. All has gone well until the time came for action, when, at the critical moment, some one owner of a racing yacht, or ex-racer probably, after neglecting to attend any previous meetings, is present with his friends to vote down a proposal which he cannot or will not comprehend. Such cases as this—and they are discouraging enough—will be recalled by all who have honestly labored for the improvement of measurement rules.

The old Thames tonnage rule is a typical instance of the cause of failure of the formula type; its theory of using the three main hull dimensions as a measure of "size" was good in its way, but the practical application was faulty, the assumption that the depth of every yacht was equal to half of her beam being false in the most extreme degree. The facts of the case were so plain and simple that they could not be overlooked or denied; while beam was taxed heavily, depth was practically free, the ratio being worse each year, the rule was wrong in theory and bad in practice, and for years worked actively to produce a poor type of yacht and to destroy yachting in all its branches. In spite of all this, it was not until 1886 that British yachtsmen, after suffering under its bondage for nearly half a century, consented to the abolition of the tonnage rule. It is safe to say that while a rule based only on the three dimensions would be useless to-day, had depth been given a real and approximately true value at the outset, many of the evils of the tonnage rule would have been avoided.

The Seawanhaka rule was at the date of its adoption far ahead of the times; the immediate question with its sponsors was not whether the formula was as good as could be made, but whether yachtsmen could be induced to accept anything as good as it really was. The New York Y. C. refused to adopt it as originally proposed, and altered the constants so as to encourage excessive sail plans, only adopting the Seawanhaka constants in 1889. It is quite possible that those then interested in the work, a very able and progressive committee, might have formulated a better rule; but it could not have been adopted and their work would have gone for nothing. The same is true of other rules of the type, they have been compromises, unsatisfactory in most cases to their sponsors, who at the final moment were confronted with the unpleasant alternatives of marring their work by concessions to ignorance, prejudice and selfishness (vested interests) or of seeing it rejected entirely.

The conditions to-day are very different from those existing even three years ago, much less at more remote times. There are to-day no vested interests, because there is no yacht racing; yachtsmen who have refused for years to recognize the evil tendencies of faulty and inadequate legislation have been at last compelled to face the inevitable results, to accept them and to reason as to their causes and the remedy. It seems to us that the situation is more hopeful than ever in the past. The specific statement has been made by the yachting public that it desires a rule which will encourage a useable type of yacht and not a racing machine; the means to this end have been generally discussed, the defects of the rule which made the fin-keel possible are far better understood than ever before, and in every way there is an opportunity such as has never existed for the presentation and general adoption of a formula which includes all the vital factors of measurement. Under these conditions we at least are well content to continue to work in the old line, rather than to start entirely anew in a totally different direction.

Now to take up the other side, the restricted classes; their success has been due perhaps less to the intrinsic merits of the plan than to the fact that, from causes which should have been avoided, as pointed out above, the other method has failed. If the Seawanhaka rule had been amended in time, in 1891, by the addition of such a factor as would have prevented the reduction of area of midship section, or a similar course had been taken in England, there would have been no restricted classes. From the very nature of the case, the restricted type of rule has been tried under totally different conditions from those affecting the ordinary formula. In establishing a restricted class there are, of course, no vested interests to stand in the way of all wholesome regulations; and in order to join in such work a yachtsman must have reached a point where he no longer looks upon absolute speed as the sole end of yachting, and where he has given some thought to existing evils as exemplified in the racing machines that he has abandoned, and to the proper and practicable means of avoiding them in the wholesome boat which he proposes to build. Starting under such favorable conditions as these, the result naturally should be far more satisfactory than in the case of a formula altered and patched at the last moment in order to secure its adoption as a compromise. If the old type of rule could be tested under the same conditions as are an essential to the existence of the restricted class idea, the result would be far different from the experiences of the past.

While much has been done by the restricted classes, it must not be assumed that they have been a universal or unqualified success. One of the most conspicuous instances in this country is the Boston knockabout class, starting on the best possible basis of a clearly defined type of yacht, already in existence and general use; the aim of the founders of the class being to protect it from degeneration into a racing machine. What the knockabout was in 1894 is shown by the definition then adopted as a part of the restrictive rule governing the class, "a seaworthy keel boat (not to include fin-keels), decked or half-decked, of fair accommodations, simply rigged, without bowsprit, and with only mainsail and one headsail." What the knockabout had become in 1897 is known to many of our readers, an extreme fin-keel racing machine, of elaborate and costly construction and useless except for racing; and this, in spite of restrictions that were devised in good faith by competent men, and were quite as stringent as could possibly be adopted at the time. The fin-keel has dominated the class, the lateral plane has been cut away with unsparing hand in spite of the restriction as to the rudder hung on a sternpost, and the type has departed entirely from its original purpose, however well it may fulfill a different one. There is nothing in the experiment of the knockabout class to warrant the belief that any better results could be expected in a general application of the same system to all classes of yachts.

Though in presenting these views we offer them merely as our individual opinions, they probably represent fairly well the ideas of those yachtsmen who favor the present type of formula, and in this way as an answer to the first part of Sextant's criticism.

As to the justification of the proposed formula, and a proof of its probable value, it may be said that the result of a practical test of fifteen years is to show that the values of L.W.L. and S.A., in the Seawanhaka formula are as nearly correct as they can well be when applied to a wide range of sizes; and, on the other hand, that the rule is faulty in the lack of some factor or factors related to the bulk of the body of the boat. Many proposals of amendment in this direction, by means of displacement or some equivalent factor as a divisor, and in other ways, have been made; but in nearly all of these the leading idea has been to place a premium upon absolutely large displacement, giving internal room. The plan presented by Mr. Hyslop and favored by the committee is, we believe, more scientific and at the same time promises better practical results than any other thus far advanced on either side of the Atlantic. Mr. Hyslop was the first to point out a fact that will be promptly appreciated by all interested, that the speed of the modern racing machine, both of the fin and the skimming dish types, is due to the free use of an element which is quite as justly an object for taxation as the other elements of speed—the lever by which stability is obtained. This lever may be either vertical, as in the fin on which the bulb is carried, or horizontal, as in the beam of the skimming dish on which the crew does its hiking; or a combination of both. When one or both levers are used in combination with a fairly full section they, in a general way, produce a desirable type of yacht and represent work honestly done in her propulsion at a given speed. When, however, either or both is associated with an abnormally small area of midship section, in the modern canoe or flat-iron type of hull, the yacht is necessarily a racing machine, with no accommodation, and obtaining her speed, as assumed with the same L.W.L. and sail area as the first boat, without performing the same useful work. If this proposition be true, it is only fair that the lever should appear in the formula with the L.W.L. and S.A. There are numerous other factors which could be employed, and there may be some which would be still better, but of all that has thus far come before us Mr. Hyslop's diagnosis of the case seems the most searching, scientific and accurate, and his general proposal of a remedy the most promising. As to the details, the summation of the beam and depth, and the comparison with the area of midship section reduced to a linear factor, they were suggested by him as a part of his original investigation, and as far as can be predicted short of actual test in use they are about right. The constant may be placed at any point, according to the type of yacht desired; the suggested figure is derived from a study of existing yachts, as in the table on page 58 in the FOREST AND STREAM of July 16, the average of well-known yachts of wholesome type.

It is hardly fair to say that yachtsmen are asked to adopt the rule on faith, it has been widely advertised for some time past, and no action will be taken until the fall; the reasons for it are set forth in the report, and any yachtsman of ordinary intelligence can apply it to different types of yachts and satisfy himself of its probable operation. The only final test of any rule is the actual designing, building and racing of yachts; short of this a good deal must be taken on faith; but in the present case we submit that everything possible has been done to present the proposal clearly to all yachtsmen, and to induce them to criticise it freely. What the Seawanhaka C. Y. C. and its race committee and special committee desire above all else is a general and careful study of the subject by yachtsmen in order that some positive progress may be made in the fall. As matters are now, we doubt whether anything is to be gained by a further discussion of Sextant's point, the type of rule; there is much more to be done by a concentration of all efforts on the line of work which yachtsmen always have followed, and still seem inclined to adhere to, the production of a satisfactory formula composed of variable factors.

We cannot agree with Sextant that the designer has no more freedom under the Seawanhaka rule than under the knockabout and similar rules; he has an infinitely wider choice both of general type and of specific dimensions, a fact that hardly seems to require proof. So far as the liberty of the designer to drive his tandem or triplet deliberately through the spirit and letter of a rule, it must be curtailed in his own interest, if not in the interests of yacht owners and the sport at large, or he will be left indefinitely where he is now, with no clients; possibly forced to resort to the designing of bicycles or golf sticks. The object of a rule in this respect, as we understand it, is to place before all designers equal opportunities for the employment of the factors of speed, leaving as much liberty as possible to each in the combining of these factors. The liberty which allows a designer to put a fin-keel in a class of wholesome and full-bodied boats hurts him in the end, though its immediate effects are more disastrous to others.

In the last paragraph of his letter Sextant points out that the assumptions of values for the different factors in the proposed formulas are not founded upon any known laws of the resistance of partially submerged bodies moving in water. This is quite true, it may also be said that they are in no way related to the binomial theorem or the Dingley bill; but it does not follow that the result must be a failure in practice. We are constrained to admit that there is in practice, as every yacht designer knows, a broad line between scientific naval architecture and the successful designing of racing yachts. The former alone, however perfect its theories, never has and probably never will produce successful yachts; in fact the efforts of eminent naval architects in the field of yacht designing, as in the case of J. Scott Russell, have been conspicuous as failures rather than in any other way. While the science of naval architecture is the foundation of yacht designing, and a thorough knowledge of its truths is indispensable to the successful designer, he must in the end rely on practice, experience and largely on empirical methods. This is peculiarly the case in the matter of measurement rules. The investigations of naval architects, interesting and useful as they are in many ways, have really lent little aid to the actual making and amending of formulas and restrictions; and the best work yet accomplished has been largely empirical; the result of experience, observation and sound common sense rather than of elaborate computations of abstract theoretical values. In this respect the present proposal is on a par with many others, as not claiming in any way a high scientific origin. The values are deduced from actual practice as embodied in the moderate type of wholesome yacht which it is desired to encourage, and the extremes of racing machine and slow cruiser, which it is desired to discourage. The new factors employed are all simple and easily handled, but it is believed that they will prove effective for the immediate future, and at the same time be capable of readjustment to meet developments of design that cannot now be predicted.

It would be necessary to continue to an indefinite length in order to argue fully all the points made by Sextant, and our space will only allow us in conclusion to touch briefly on a few specific statements. He says, "In other words, designers have been free to make a single type of racing machine, and nothing else." That this has been the ultimate result of every rule is simply because, as already pointed out, the rules, as compromises, have been faulty in the first place, and vested interests have opposed all attempts to remedy promptly the weak points of the rules as they have developed. There is at the present time good reason to hope that the yachting public is willing to adopt a better formula (one including more factors of advantage), and that it is at last awake to the necessity, after securing a good rule, of constantly studying its operation and practical results, and possibly of amending it in time to stop undesirable developments. If this course is followed, the rule will not result in the production of a single type of racing machine.

Another objection is that the committee has not recommended the summary barring of all types of yacht save the one which it is desired to encourage. As far as we have been able to gauge the opinions of yachtsmen of all classes, there is no desire whatever for the establishment of a series of standard designs, one for each class, to which they shall be compelled to build, all other types being barred. This is practically what Sextant's plan, as we understand it, calls for, whether in the shape of actual one-design classes, or of restricted classes only; provided the restrictions are real and not nominal. The expectations are that the proposed formula will produce a general type of yacht possessing a reasonable amount of accommodation, and a freedom from some undesirable details which detract from general excellence in a greater degree than they add to speed; and at the same time that designers will be allowed considerable liberty of choice as to keel and centerboard types and general dimensions and details; as much so as was the case in the days of the 40ft. and 30ft. classes, the centerboards and keels being built about in equal numbers, and racing on as perfect equality as could be expected. As yachtsmen, even those elected to the high honors of measurement committees, are but human, it is quite within the bounds of possibility that the present attempt may prove as great a failure as any that has preceded it, but while those at present interested in the work can claim nothing in either ability or honesty of purpose over others who have failed, they at least have a far broader field of view through the recent developments of yacht designing, and the general discussion of both design and measurement, and they are working under far more favorable conditions.

The question of light construction and its regulation is in itself so great in extent and so important that to deal with it adequately would require at least as much time and labor as the committee has been able to expend on the entire subject of amending the formula. To have dealt exhaustively with this part of the subject was simply out of the question under the circumstances, but the committee has pointed out a method of relating the subject of light construction to the formula that is new and original, and most promising in theory. When it comes to the actual practice, the same serious difficulties are met with as in other schemes for regulating construction.

The proportions of Glencairn I. and II. are instanced by Sextant as proving that the values assigned to L.W.L. and S.A. in the present Seawanhaka rule are incorrect. We cannot admit for a moment that the results in the small open classes, in which live ballast is the controlling factor of design, are to be considered as in any way conclusive as to the merits of a formula for decked yachts of such size as to afford cruising accommodations. These little machines are entirely apart from the yacht class, and it is quite possible that a totally different rule may be needed for them; though even then it is hardly likely that they can be squeezed within the meaning of the term "wholesome." The general opinion of yachtsmen seems to be that in the yacht classes, from 30ft. upward, the present values of L.W.L. and S.A. under the Seawanhaka rule are as nearly correct as can be had to cover a range of sizes from 30 to 115ft. We have heard no demand for a heavier tax on sail, and to propose such at the present time would probably awake a lively opposition. We have for many years labored for heavier restrictions to curtail the immense sail plans seen at times on successful yachts; but at the present time we see no need to increase the direct tax on sail in the formula. The indirect penalties, which must be considered in connection with any rule; the proposed inclusion of the sail carrying levers in the formula, the existing crew limits, the general prohibition of club topsails not taxed in the rule, all act to one end, of producing a compact and easily handled sail plan. Much more can be done by the careful regulation of these contributory factors, for instance, by keeping the crew limit in each class down to the number required to handle the boat and sails in a seamanlike manner, than

by a direct increase of the constant of sail area in the formula.

While we have by no means followed that injunction which we freely give to our correspondents, as to the beauty of brevity and condensation, at the same time we have hardly covered all of the numerous points raised by Sextant. There are none, however, that we have intentionally avoided, and we shall be glad to discuss further any which he may be inclined to point out.

Our attention has been called to a typographical error in Sextant's letter, on the fifth line from the bottom of page 57, where the expression $\frac{(.65 - .0x)}{5}$ is printed $\frac{(.65 - .04)}{5}$.

The America Cup.

WITHIN the past week the yachting situation which, in the absence of the New York Y. C. cruise and the Goelet cup races, and other Newport festivities, ordinarily occurring at this date, has been extraordinarily dull, has been enlivened by definite and reliable news of a new challenge for the America Cup, promising a match in 1899. The details, cabled to New York early last week, and announced "exclusively" by all of the daily papers, are that Sir Thomas Lipton is about to issue a challenge, under the endorsement of the Royal Ulster Y. C., for a match next season. This latest venture will be distinctively Irish: the challenger is an Irishman, born in Scotland; the yacht, to be designed by Will Fife, Jr., of Fairlie, Scotland, will be a 90ft. l.w.l. cutter, named Shamrock, and will be built at the great shipyard of Harlan & Wolff, in Belfast; the skipper may be William O'Neil, an Irishman who has won his reputation as one of the first of British skippers in Silver Star, Irex and Iverna, under the flag of Mr. John Jameson, the Dublin yachtsman.

The idea of challenging for the America Cup has been in the mind of Sir Thomas Lipton for some time past, and within a year it has been discussed with the Royal Ulster Y. C., and also with Mr. Will Fife, who has been at work on the design for the challenging vessel. The preliminary arrangements are now all completed, and steps have been taken to open immediate negotiations with the New York Y. C. To this end the secretary of the R. U. Y. C., Mr. H. C. Kelly, will sail in a few days for New York, accompanied by Messrs. H. G. McGildowney and Charles Russell. Mr. McGildowney, who is connected with the firm of Harlan & Wolff, is a racing yachtsman and amateur designer, having designed the old ten-tonner Melissa, built in 1886, and raced by him for several seasons, and later having designed and also built the 20-rater Maledetta. This special committee will be fully empowered to represent Sir Thomas Lipton, and to negotiate for him and the R. U. Y. C. with the New York Y. C. There is little doubt that the negotiations will be carried to a successful end, and that a match will be sailed next year. On Aug. 8 a cabled notice of an intention to challenge was received by the N. Y. Y. C. A special meeting being called to consider it, on Aug. 11.

The Holder.—The New York Y. C. at the present time needs and wants a challenge for the America Cup. In spite of the emphatic declaration made a year or two ago by its special committee, and endorsed by the club, to the effect that it was not a racing but a cruising organization, the fact remains that no yacht club can be prosperous without yacht racing, and that racing has ceased in the New York Y. C. This particular year proves nothing, fortunately; the war has stepped in to throw a veil over the condition of racing in the larger classes, but the failures of the annual regattas in the past two years, the abandonment of the fall regattas, and the neglect of the Goelet cups, show the need of some powerful stimulant, both for the sake of the club itself and of yachting at large as affected by it. What racing there is at the present time is exclusively under the influence of associations composed of numerous smaller clubs; these associations make the racing rules and manage the races. If yachting revives next year under such favorable influences as are now promised, outside the America Cup, it will be in the classes under 60ft. R.M., and under the patronage of the associations, and not of the New York Y. C. There is no prospect whatever of a spontaneous revival of building and racing in the larger or even the medium classes of schooners or cutters.

In the America Cup the New Y. C. has the most powerful instrument for the promotion of yacht racing ever in existence. Held upon perfectly fair terms, as its original and lawful owners originally dedicated it, in their own words, "a challenge cup for friendly competition between foreign countries," there need never be any lack of challengers; and both the New York Y. C. and American yachting at large may reap the benefits of international competition. The need of such a stimulus was never greater than at the present time, unless perhaps in 1885, and then the conditions were radically different. What was needed then, and what really resulted from Genesta's challenge, was a stimulus to American invention and progress in yachting; but such is not the case at the present time, it is racing and not designing that requires aid.

While an international match in any size of yacht cannot fail to benefit the New York Y. C. in bringing it once more into the first place in the attention of the yachting world, and the general public, it depends entirely on the question of the size of the challenger and defender whether the resulting benefit shall be limited to the New York Y. C. alone, and then to but a moderate degree, or whether the races shall bring permanent benefit to the club and to yachting at large as well.

The Chalelnger.—Thomas Johnstone Lipton was born in Scotland, of Irish parents, about fifty-one years ago, and began life as a storekeeper on a very small scale. Through his inherent ability as a business man he gradually built up a business, including a number of small retail stores, for groceries and provisions, in time extending it until he controlled a very large part of the tea business of the world, "Lipton's teas" being famous everywhere. He also controls very large interests in the provision, beef-packing and similar lines, furnishing supplies for the British army and navy. His fortune is estimated at $50,000,000. During the Queen's Jubilee he donated a sum of $125,000 for the benefit of the poor of London, and in return received the title of baronet. A little later he gave a similar sum to the Indian famine fund. His business brings him frequently to America, and only a few weeks ago he was in New York, the rumor of a possible challenge from him being then circulated, with his denial of any immediate intentions.

As an aspirant for the highest honors of the yachting world, Sir Thomas Lipton possesses none but negative qualifications. He has never owned a yacht, he has never belonged to a yacht club until he joined the Royal Ulster a few months since, and he has, in the course of a very busy life, taken no interest whatever in yachting or yacht racing. He is, from all accounts, rich, ignorant as far as the sport of yachting is concerned, and complaisant, in that he is ready to accept any terms conceded by the New York Y. C.

It would obviously be most unfair at the present time to criticise his motives or to condemn his venture into yachting as animated by anything other than a love of sport, and we sincerely hope that he may in good time become a yachtsman in every sense of the word. At the same time it is quite evident that he is in no sense a representative British yachtsman; and in our opinion he is in no way qualified as the leader in an enterprise of such magnitude as that of challenging for the America Cup; an undertaking whose success, in the minds of good sportsmen, is not measured by the final possession of the trophy, but by the manner in which the whole contest is conducted. Such a task requires a thorough knowledge of yachting and yacht racing in all their branches, a knowledge only gained by long experience. Nothing is more true than, as Gilbert says in "Patience,"

"One can't buy high æsthetic tastes like trowsers, ready made,"

and on the same principle one cannot buy yachting experience put up like tea in pound packages. It would no doubt be highly interesting, to the spectators, to see Hank Haff, Charlie Barr, Billy O'Neil or John Carter forsaking the wheel and tiller to bull the tea market or to speculate in dressed beef, but the result might not prove so satisfactory to the participants.

Every experienced yachtsman knows that, however perfect the work of designer, builder, sailmaker and skipper, the personality of the owner stands out prominently in the case of every successful yacht, as in Gen. Paine's work with Puritan, Mayflower and Volunteer, and Mr. Iselin's success with Vigilant and Defender. We should have a far better opinion of Sir Thomas Lipton's judgment, and far stronger hopes of his success as a challenger, even though not a winner, if he had begun by a preliminary season of racing at home, where he could find a very ample field in the 65ft. class, instead of attempting as a novice to make his yachting début in a star part.

The Challenging Club.—It has so happened in the course of the development of international racing that the exact relations of the club and individual have not been so clearly defined as is desirable. Technically the match is between two clubs, and individuals are not recognized in the main negotiations; though necessarily they are in the actual racing, as owners of the respective yachts. It seems in every way desirable that a greater degree of responsibility than now exists be laid upon each club for the conduct of its representative. We have always held that, in the case of Lord Dunraven, the New York Y. C. had a perfect right to look to the Royal Yacht Squadron, and to it alone, for an explanation of the charges made by its representative; and that the Squadron was in duty bound to call the latter to account. Without reference to the manner in which such a procedure might have resulted in this particular case, it seems to us that the principle of each club assuming entire responsibility for all actions of its representative is founded on sound sense and general sporting usage; and that it should be made a distinct point in all international contests.

In the present case the Royal Ulster Y. C. should vouch directly for the standing of the representative to whom it entrusts its burgee; the more so as he is of necessity unknown to the holder. We presume that the club is prepared to do this, that it has already, in electing Sir Thomas Lipton a member for the express purpose of challenging for the America Cup, satisfied itself that he is in every way qualified to represent it worthily; but in view of the lax usage in the past, and of the *contretemps* attending the last match, the point is one that demands definite and specific attention.

The status of the Royal Ulster Y. C. in itself is, of course, thoroughly satisfactory; the club is an old one, founded in 1866; its commodore, the Marquis of Dufferin and Ava, though distinctively a non-racing man, stands at the front as a cruising man and thorough yachtsman, and its vice-commodore, Major R. G. Sharman-Crawford, is a well-known yachtsman.

The Size of Yacht.—The question of the size of yacht more desirable for both parties is a very important one, and it is still open in spite of the announcement that the challenger has already decided upon the maximum limit of the new deed, 90ft. l.w.l. In view of the experience of 1895, the continuance of the racing in the special 90ft. class will be most unfortunate on this side of the water. Special classes are bad enough in the small sizes, and they are much worse when the L.W.L. runs to 90ft. There is nothing about the America Cup contests which should put them outside the jurisdiction of such rules as are universally recognized by American clubs, including the New York Y. C. The classification of the New York Y. C. is by racing measurement, and as a mere matter of consistency the same standard should govern the Cup races. In practice there is no gain to either party, at least there was not in the last contest; and the special 90ft. class, whether a fiction or a reality, should be abolished and the regular classes of the club substituted.

What is of real importance is the matter of absolute size of the two representatives, which, of course, will be the same. Experience has proved that anything approaching 90ft. l.w.l. is not wanted in this country, and that no amount of fostering and nursing can make such a class popular or permanent. If this size is retained, it simply means that true racing yachtsmen are excluded from the competition, and that one or more of the wealthier members of the club, at best merely owners of steam yachts, must, as a matter of patriotism, pay for a single syndicate boat. It is most unlikely that any individual racing yachtsman will to-day attempt to outbuild Defender, or even that any members of the club will put up the large amount of money necessary to construct a suitable defender, unless from a feeling of duty or compulsion. One boat must be built, but it is unlikely that there will be more than one; and after the races are over there is no future for the vessel, successful or otherwise, but the scrap heap.

Whatever benefit accrued to American yachting through the construction of racing cutters of over 70ft. l.w.l. ceased long ago, with Volunteer. In the eleven years since passed there have been launched six yachts, Vigilant, Navahoe, Colonia, Jubilee, Pilgrim and Defender. Of these one has been rebuilt and converted into a racing schooner, two are still in commission as cruisers, one has been converted into a steam yacht, and two have been laid up for three seasons, probably never to go into commission again. Conceding all that can be claimed as to the value of such experiments as Vigilant and Defender, and the gain to American designers, it is still plain that yachting at large has gained nothing from the occasional and spasmodic construction of costly syndicate yachts; and a closer investigation will show that more harm than good results. In 1895, in spite of the general interest in the international races, there was little interest in yachting; racing was on the decline, and comparatively few yachts were in commission. The money that should have gone into yachting went partly into the pockets of the owners of excursion boats. The secondary results of the big syndicate boats were plainly visible in 1894, after the Vigilant-Valkyrie II. contest, and again in 1896, after the Defender-Valkyrie III. matches. In marked contrast is the activity in all sizes and classes immediately following the building of Puritan, Mayflower and Volunteer.

The cause is not far to seek. The last three, though nominally of the 90ft. class, were of comparatively moderate cost, and suitable, through reasonable draft, for general use as well as racing. They were within the means of the wealthier yachtsmen, and at the same time fitted the general wants of yachtsmen, and held their racing value for some years. Defender, on the other hand, and the others of her class in a lesser degree, cost to build and run a sum such as no individual will put into a racing yacht, and she was utterly worthless for general use. Even as a racing machine her value disappeared with the end of the Cup racing, as she had no opponent in the home events.

The construction of a new and more extreme Defender, as now promised to meet the proposed 90ft. challenger, must act as a bar to the possible building up of smaller and more permanent classes, and to any general revival of yacht racing.

If any beneficial and permanent results are to be derived from the revival of international racing, the first step must be the change of the size of yacht to something much smaller than 90ft. l.w.l. At the present time the only approach to vested interests exists in the 51ft. class, too small in itself for Cup racing, and the field is clear for a free choice of size from 90ft. downward. The best size, all things considered, would be either the 70ft. R.M. or the 60ft. R.M. class of the New York Y. C., the former if enough yachtsmen could be induced to build to it. A modern yacht of 70ft. R.M. would have, with steel or composite construction, about the internal accommodation of the old Puritan, with much greater speed, the cost of construction and running would be materially less than in Defender; the club's limit of draft for the class, 13ft., makes a yacht that is useable and raceable within practical limits, without requiring the services of a steam tender and professional pilot at all times. Under the rules as they now stand, such a yacht would be an extreme racing machine, it is true, but still the certainty of good sport for a time, with the possibility of being chosen to defend the Cup, would probably induce the building of several boats, in place of the one which will probably be the sole dependence of the holders if the race be continued in the special 90ft. l.w.l. class.

There is not the slightest possibility that the New York Y. C. will rise to the situation in yachting, bad as it is, with a proposal to build to a smaller class, with some limitations on form and also on weight of construction; but if such could be done, it is altogether probable that a great and permanent revival of racing would follow. Once given the assurance of continued racing in the 70ft. class, in yachts in which a certain amount of accommodation was made compulsory, and in which the extreme construction was limited, there are many yachtsmen who would be tempted to build again and race as of old.

The advantages of a smaller class are almost as great to the challenger as to the defender. On the other side of the Atlantic the 90ft. class has died a natural death, a little more lingering, but quite as much as death as on this side. Britannia, Ailsa and Satanita have ceased racing and gone over to the yawl rig, to be followed sooner or later by Meteor, and Valkyrie III. has laid idle for three seasons. What life there is in yacht racing stops at the 65ft. L.R. class, just a size smaller than our 70ft.; above this is only the 75ft. l.w.l. cutter Bona. A new 90-footer can of necessity have nothing near her size by which to try her, while a smaller yacht can go in with the 65-footers, already a live fighting class.

There is so much to be gained on both sides by limiting the size to such as experience has proved can be maintained as a permanent class that we hope this matter may be thoroughly and carefully discussed by both parties before any final arrangements are made. As to the question of which side might have an advantage in retaining the Defender-Valkyrie size, it would be splitting hairs to no purpose. Defender is out of the question, unless to be rebuilt as a trial boat, her crew is scattered, and on the other hand British designers have had ample experience in the same size, and the racing

has continued so much longer there that there is a large supply of trained hands from which to pick a crew.

The New Deed.—In spite of Sir Thomas Lipton's statement that he will agree to any terms, the first point to be decided between the New York Y. C. and the Royal Ulster representatives is likely to prove a difficult one. No one knows to-day just what the new deed of gift does or does not mean, or on what terms the last matches were sailed, and as far as we can see the whole question of interpretations and concessions must be gone over anew before anything approaching an agreement can be reached. Thanks to the good work done by Lord Dunraven in behalf of the New York Y. C. prior to the last match, British objection to the new deed is now well broken down, and the holders of the Cup are in a position to dictate any terms to would-be challengers.

The Payne Exclusion Bill.

We republish with pleasure the following from the Paris Edition of the New York Herald:

One result of the war will be the increased demand that is sure to be made upon the shipbuilding resources of the United States when peace is concluded.

It is certain that orders will then flock to America from Europe. Builders in the United States have proved they need fear no competitors. Their work has withstood the test of battle and that is the severest it could be subjected to.

It is therefore time that the Payne bill were repealed. Such a step would be a sign of friendliness, as the act was originally aimed at handicapping the shipbuilders in Great Britain.

The moment has come when the United States should throw off the shackles of old-fashioned ideas and enter the lists upon the merits which the present war has shown to be so strong. The repeal of the Payne bill would show that the United States knew their power—that they had confidence in the excellence of their men and the work they could turn out.

It would also be quid pro quo for England's attitude toward the United States. If she had only held up a hand, Europe's back would have been stiffened for interference, and the United States would have had to fight down cis-Atlantic opposition.

England's firmness has materially helped the United States and has won for her the hearty dislike of Europe. A friend in need is a friend indeed. England has proved her sympathy by her action, and the United States ought to show that they appreciate the service rendered them.

American shipyards will have more work on hand than they can do when peace is made. Many of the owners who have sold their yachts to the United States Government will want new ones when hostilities cease. They will not feel like waiting as long for their craft as they will have to do while American yards are all occupied with turning out warships for England, Russia, France, Germany, Japan, China and other nations who will want to have their navies put upon the same footing of superior effectiveness that the United States marine has proved to be.

The Payne exclusion bill is a blot upon the long and honorable history of shipbuilding in America, a confession of cowardice, incapacity and narrow prejudice, which is totally at variance with the honorable record of marine triumphs now covering well nigh a whole century. Unable, through causes for which they alone were to blame, to compete in a fair field with British designers and builders, the American builders went before Congress, unfortunately with successful results, with a cowardly petition for the protection of their own faulty work by the complete exclusion of the work of their more skilful competitors. The bill, as finally passed, suggests in its rigid provisions the customs regulations of Spain and China rather than of free and progressive America, providing for the complete exclusion from American waters of yachts of foreign build.

Though directly intended to apply to steam yachts, the bill also covers sailing yachts, and makes it impossible for an American to bring to this country a foreign yacht for trial with the home-built craft, as was done with such good results to sport and to the home builders in the cases of Maggie, Ulidia, Jessica, Minerva and Clara.

The bill is thoroughly bad in its effects upon yachting as a sport, and it works additional harm, in that the American builder, free from all fear of competition, is under no necessity to improve his work, but the owner, after paying the highest price, must put up with such defective craft as are floated each season. The worst feature however, is its evident animus of open hostility to other nations, especially to Great Britain.

There has never been a time in the history of this country when, if fairly put to the test, Americans have failed to defeat all competitors on the seas in fair competition. It was so of old in the early naval wars, later on the same story was repeated with the clipper ships, and to-day the new vessels of the American navy are bringing fresh laurels to their builders by their good work under severe conditions of actual war. That such results have been reached in our war vessels is due to the fact that the American Government at the outset bought its designs in the open market and placed the American builder under the absolute necessity of producing something better in order to win the heavy premiums paid for special excellence. As soon as the builders awoke to the condition of affairs they met them by throwing into the work that energy and inventiveness which is the national characteristic. To-day no Payne bill is needed to protect the warship; on the other hand, our builders are busy with contracts for foreign powers.

In steam yachting a very different condition of affairs has existed, and is yet by no means a thing of the past. The average steam yacht owner, with an ignorance of yachting which is proverbial, knows nothing of what he proposes to buy except that she is to be larger, faster or more magnificently furnished than some yacht which he has seen. The many important details which in the case of a house he would settle personally in frequent conferences with a high-priced architect are ignored entirely by him; and his dry nurse, the captain, who has probably instilled in him a contempt for and distrust of the professional yacht designer, is given carte blanche to negotiate with such a builder as he may select. What wonder is it that under such circumstances the builder does the very least he possibly can for the money, patching up some old blue prints for the hull designs, and some old patterns from the loft for the engines? It is this sort of work which, though not universal, is kept constantly before the yachting public in disputes between owner and builder over the final completion of contracts, or through the rebuilding of yachts before the first coat of paint has worn off the bottom, which the Payne bill was designed to protect. Those American builders who are doing honest work in the careful and systematic designing of yachts, and in building for a reputation instead of for the immediate return alone, know perfectly well that they have nothing to fear from foreign competition, and that as long as yachting is popular they will have orders to build.

At the present time there is, even from the narrow and selfish point of view of the American builder, no necessity whatever for the Payne bill. He can be reasonably sure of all the work his stocks can accommodate, and much of it more profitable than the yacht trade. Of the latter there is likely to be more than enough for the yards for some time to come, everything points to a general revival of business that will make yachting possible, and of a revival of the sport for its own sake. Considering the hostile feeling awakened by the Payne bill on its passage, there is probably nothing which would serve as well at the present time, when the shipbuilders of America are enjoying a well-deserved victory through their battleships, as the frank and voluntary repeal of the obnoxious measure.

The Tail Wags the Dog.

The following is a characteristic sample of those broad and liberal views on yachting which are the pride of the Boston Herald. Speaking of the coming races for the Seawanhaka international challenge cup, it says:

Some writers call the boats "20-footers," thereby giving the impression that the above length is that of their waterline. They actually measure about 17ft. 3in., and carry about 500sq.ft. of sail, which ratios, according to the Seawanhaka rule, make them "20ft. racing length" under a rating rule. It is fairer to the public, in order that the length of the boats racing in Canada be known, to call them 17ft. waterline length, with a restricted sail area of 500sq.ft. The class lengths governing the racing in the M. Y. R. A. are made on waterline lengths, and not on a rating rule, consequently our yachtsmen will not be benefited by the Canadian racing so far as the development of fixed waterline length boats goes.

It is quite true that the boats are called "20-footers," not only by "some writers," but by all yachtsmen, that being their official designation. The standard of "corrected length," as it was formerly called, or racing measurement, as it is now officially designated (length and sail area by the Seawanhaka rule), is now the recognized yacht measurement of America, formally adopted by the Atlantic coast clubs, all the clubs of the Great Lakes, the clubs of the inland lakes and on the Pacific coast. It is the one rule of the New York, Eastern, Seawanhaka, Larchmont and Atlantic clubs, of the Y. R. U. of N. A., the Lake Y. R. A., and the Sound Y. R. A. The one exception to its recognition is the Y. R. A. of Massachusetts, which, after various experiments with length measurements, now has under trial the plain L.W.L. measurement.

To say that a yacht is a 15-footer, a 20-footer or a 51-footer conveys to any well-informed yachtsman but one idea, that the figures relate to her measurement by the Seawanhaka rule. This goes without saying, but if any other rule is meant, it must be specifically stated. It is safe to assume that the public, with better and more reliable sources of information at hand than the Boston Herald, knows exactly the meaning of the term. The Y. R. A. of Massachusetts has, for reasons which seemed proper to it, adopted a different measurement from that in general use, but at the same time it has made no such claim as that of the Herald, that its rule, a purely local one, is the sole standard of American yachting.

"Dunraven Influence."

The daily papers, in connection with the new challenge, are devoting much more space than it deserves to what they call "Dunraven Influence," and which they assume will be a powerful factor in discouraging the negotiations for a match. The following, from the last issue of the Yachtsman, is cabled across as an example of "Dunraven Influence":

That the challenge is to be unconditional, and that Sir Thomas only wants the better yacht to win, shows that the challenger has but a nebulous idea of how the America Cup races are arranged. Without conditions, that is to say, by some variation of the new deed, the better boat, if she be challenged, has a very scant chance of winning.

So long as he gets the races arranged, the knight is content that the objectionable new deed should be forced down British yachtsmen's throats, and all the crooked conduct of the New York club in that matter is a thing of no moment to this latest aspirant for notoriety.

The challenger himself is the authority for the statement that he has no regard for the very important questions of principle involved in the long dispute over the new deed and the accompanying actions of the New York Y. C., and that he is willing to compromise the interests of those yachtsmen, British or American, who have opposed both as a discredit to the noblest of sports. So far from being at variance with Lord Dunraven in this, he is following directly in the steps of the noble earl. It was "Dunraven Influence," exerted persistently from 1889 to 1895, that removed the once formidable objections of the Royal Yacht Squadron to the new deed and put the New York Y. C. again in possession of a challenge from the squadron. "Give the devil his due" is a good old adage, and all that he has since done cannot wipe out the work of Lord Dunraven toward the recognition and restoration of the new deed of gift.

New Steam Yachts.

Within a very short time the fleet of converted steam yachts now in service will be sold by the Government; only a few, in particular Mayflower and Gloucester, being retained in the navy. It is quite probable that all of the yachts offered will find a ready sale, of course at moderate prices, as much work will be required to refit them as pleasure craft. At the same time, yachtsmen are already placing orders for new yachts to replace those sold in this way. The big steam yacht for Com. J. Pierpont Morgan, N. Y. Y. C., designed by J. Beavor Webb, is now well under construction. The owner of Aileen, Richard Stevens, has placed an order with the Delaware River I. S. B. & S. E. Works, Roach's yard, for a steel steam yacht 150ft. over all, designed by Gardner & Cox. It is reported that P. A. B. Widener, former owner of Josephine, now Vixen, will have a 250ft. steam yacht, to be built at Harlan & Hollingsworth's yard, Wilmington. C. L. Seabury & Co., the builders of the steam yacht Kanawha, recently sold by John P. Duncan to the Government, have an order from that gentleman for a twin screw steel yacht of 225ft. over all, 192ft. l.w.l., 24ft. beam, 14ft. 6in. depth, and 10ft. draft. A speed of twenty miles is guaranteed for a run of two consecutive hours. She will be schooner rigged, with three masts and leg o'-mutton sails, with a squaresail on the foremast. Her power will include two triple compound engines, 14, 23¾, and 43 by 24, with four Seabury water tube boilers. She will be constructed under the rules of the U. S. Standard Association, and in addition to a very convenient arrangement of space she will be fitted with a complete outfit of auxiliaries, electric plant, ice and condensing plants, etc.

The Cruise of the May.

The steam yacht May, Com. Alexander Van Rensselaer, has neither been sold to the Government nor laid up, her owner apparently finding ample use for her even in war times. In the last days of July she was at Oyster Bay, with Com. Van Rensselaer and the race committee of the Corinthian Y. C., of Philadelphia, on board, to arrange the details of the interclub races of the knockabout fleet, beginning Aug. 22. She returned to Philadelphia on Aug. 2, where sixty tons of supplies, including provisions, surgical instruments, shoes, hammocks, liquors, pipes and tobacco, American flags and other articles, were shipped as speedily as possible. On Aug. 6 she sailed for Porto Rico, where the supplies will be landed for the use of the troops. Com. Van Rensselaer a short time since offered the yacht to the National Relief Commission, free of all expense, to carry supplies to Porto Rico, and on the offer being accepted at once proceeded with the necessary arrangements. He sailed on the yacht, accompanied by Mrs. Van Rensselaer and her daughter, and three of his associates on the Relief Commission, Messrs. William Porter, Louis Vanuxem and G. G. Groff. The May is the Watson yacht brought to this country by E. D. Morgan before the passage of the Payne exclusion bill.

Rifle Range and Gallery.

Rifle at Shell Mound.

San Francisco, July 25.—A fair number of marksmen appeared at Shell Mound yesterday. Conspicuous among those present was D. W. McLaughlin, who has just returned from New York, where he won medals and coin galore at the triennial Schuetzen Bund festival. Through the efforts of California representatives the next meet of the Bund will be held in San Francisco.

At the monthly bullseye shoot of the Germania Schuetzen Club prizes were awarded on the following scores: John Gefken 232, Louis Haake 320, D. B. Faktor 646, D. Salfield 697, H. Zecher 735, A. Jungblut 897, H. Lilkendey 941, F. P. Schuster 962, John Tiedemann 1,091, F. Rust 1,135, C. Nobmann 1,357.

The following scores secured prizes at the monthly bullseye shoot of the San Francisco Schuetzen Verein: J. Beuttler 232, Otto Burmeister 470, A. H. Pape 543, H. Stelling 577, William Ehrenpfort 711, Henry Meyer 801, John Gefken 929, H. Lilkendey 934, J. C. Nobmann 938, F. P. Schuster 975, Otto Lemcke 1,001, John Horstmann 1,126, Frank Koch 1,134, John Tiedemann 1,158, Louis Haake 1,173, J. W. Gietze 1,339, John de Wit 1,434, D. B. Faktor 1,496, F. L. Pape 1,520, Henry Zecher 1,538.

At the monthly medal and class shoot of the Columbia Pistol and Rifle Club the following scores were recorded: Members' rifle medal—A. B. Dorrell 48, 60; M. Carillo 121. Bushnell military rifle medal—A. H. Pape 47. All comers' rifle medal—A. H. Pape 54, 57; Dr. Rodgers 60. Columbia target, open to all comers, pistol, Siebe medal—J. P. Cosgrave 58, 64; G. M. Barley 61. Twenty-two caliber rifle, 50yds., Roos torphy for ladies—A. B. Dorrell 18, 20, 22; Mrs. G. Mannel 31, 34; Mrs. M. J. White 38, 40.

Roeel.

Columbia Rifle Club.

Rochester, N. Y., Aug. 2.—At the club's range in the Reynold's Arcade, the scores below were made to-day in the regular shoot of the Columbia Rifle Club:

McChesney	22	23	24	24	24	24	24	24	25	25	—239
Willard	19	20	22	23	23	24	24	25	25	25	—230
Gifford	21	22	22	22	23	24	25	25	25	25	—234
McCord	23	24	24	24	24	24	25	25	25	25	—243
Andrews	20	21	22	23	23	23	24	24	25	25	—230
Gliddon	20	21	21	22	23	14	21	25	25	25	—230
Hendrickson	23	23	24	24	24	24	24	24	24	25	—239
Fredericks	20	20	22	23	23	23	24	24	25	25	—229
Compton	18	21	22	23	24	24	24	25	25	25	—231
Candee	19	19	20	21	22	22	23	24	24	25	—219
Joslyn	20	21	22	22	23	24	24	24	24	25	—229
Wray	19	23	24	24	24	25	25	25	25	25	—239
Clark	18	22	22	22	23	23	23	23	25	25	—226

Zettler Rifle Club.

Brooklyn, Aug. 6.—The members present shot three strings of 10 shots, off-hand, 200yds., at Cypress Hill Park to-day. Mr. Fred C. Ross, the famous rifleman, did some very steady, regular shooting. The scores:

F C Ross	225	225	224	674
H Holges	225	223	219	667
R Busse	229	222	215	666
I Martin	229	217	218	664
B Zettler	212	210	208	630
A Kronberg	221	203	201	625
C G Zettler	209	208	207	624

1899.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication n hese columns, also any news notes they may care to have printed. Tiee in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The programme of the fifth annual tournament of the Lake City Gun Club provides ten events each day, five at 10 targets, five at 15, $1 and $1.50 entrance. August 17 and 18 are the dates, and shooting commences at 9 o'clock. A magautrap will be used. Targets 2 cents. Purses divided 50, 30 and 20 per cent. Five dollars in gold will be given each day to the shooter making the highest average in the day's programme. The club informs its patrons that reduced fare can be secured on all roads by purchasing tickets to the Winona Assembly grounds, which is but a short distance from Warsaw, Ind. Guns and shells shipped in care of Mr. J. S. Camfield, the club secretary, will be delivered on the grounds free of charge. In respect to experts and manufacturers' agents the club says: "For the past four years the Lake City Gun Club has made its tournaments open to the world, and we are proud to note that we have had with such crack shots as Heikes, Gilbert, Powers, Trimble, Winston, Fanning, Mackey, Ruble, Bush, Young, and many others—all of them perfect gentlemen, whom we would like to see at our tournament this year. By making our tournaments open, however, many amateur shooters in our section of the country have remained away because they did not feel able to compete with experts and manufacturers' agents. This year the management has decided to give a tournament for amateurs only; and while experts and manufacturers' agents are barred from competing for prizes, they are welcome to display their goods and shoot for the price of the targets, assuring them that we have made this decision with the kindest feeling for all."

The programme of the ladies' day tournament and flag raising of the Rochester Rod and Gun Club, fixed for Tuesday of this week, is something unique in its composition. We regret receiving it too late to review it more fully. The following play on the names of the club members will be appreciated for its humor by those who are familiar with them. Under the heading "How to Get There" are the following directions: "Take Monroe or Park avenue cars, take a canal boat, take the tow path, take your bicycle, take your gun and throw lead into the canal boat, but get there. (Brin)g your wife or sweetheart to (G)lovers' retreat, and next day you would Hadley know her, she'll be so much Weller. Byer a street car ticket, don't let her walk thro-h the Lane! Nort-on your life. It's easier to Wride, and she might get in the Myer, and Borst a shoe lace; in which Case don't try to Palmer off for a Mullan. She may be Schleyer than Sam's William Goat just back from Fulton with a Tassell on his neck. You can't Foley McCord. Don't stop at Cappie's, we'll have something better. Music will be furnished by Hadley's Band. There'll be a hot time." The shooters are cautioned as follows: "Now get there on time. Start at 1 o'clock, and don't trust to your wife's watch. Nothing is so ignorant as a man's left hand except a lady's watch."

The shooting this week, so far as special events are concerned, are the all-day shoot of the Hobart Gun Club, Hobart, Ind., Aug. 9; the two days' shoot of the Sherburne Gun Club, Sherburne, N. Y., Aug. 10 and 11, and the Central Gun Club's sixth annual tournament, Duluth, Minn., also on Aug. 10 and 11; the trophy shoot of the Hudson River Trap-Shooters' League, Marlborough, N. Y., Aug. 11; the Central New Jersey Trap-Shooters' League, Bound Brook, N. J., Aug. 13; Auburn Gun Club's tournament, Auburn, Ind., Aug. 11 and 12.

The Lyndhurst Shooting Association, Lyndhurst, N. J., will hold a 25 live-bird handicap on Aug. 23, $10 entrance, birds extra at 25 cents each. Shooting commences at 1 o'clock. The grounds can be reached in thirty minutes from New York, either by the Erie R. R. to Rutherford, N. J., or D., L. & W. to Lyndhurst. Trolley cars reach the grounds from Newark, Jersey City and Paterson. T. W. Morfey, secretary.

Read this and then paste it in your hat for future reference, all who intend to participate in the Interstate tournament at Waterville, Me., next week, so that you may not forget to take your fishing tackle along, or do the next best thing, borrow the best rod, lines and reels belonging to your friends. This is a clipping from the programme: "The members of the club and citizens in general will be very glad to welcome the shooting representatives of the Interstate Association, and will do all in their power to make their stay in the city a pleasant one. On Aug. 19, the day following the tournament, the visiting sportsmen will be invited to join an excursion to the largest lake in Kennebec county for a day's fishing. A steamer will be provided for the accommodation of the party. At this lake it is not uncommon for twenty-five or even fifty bass weighing from 1 to 4lbs. each to be taken by one rod. Visitors who can conveniently take angling equipments will do well to bring them along."

The Sidell Gun Club, of Sidell, Ill., has issued its programme for its two days' tournament on targets, Sept. 7 and 8. Of the twelve events of the first day, six are at 15 targets, entrance $1.50; four at 10, entrance $2, and one at 100, the latter having $75 added, entrance $5, and only amateurs allowed to compete in it. There are twelve events for the second day, five at 15 targets, three at 20, one at 25, entrance $3; one at 10, entrance $1. One is at 50 targets for the Vermilion county championship, and a $25 gold medal, entrance $3. The last event is a team shoot, four men to a team, 25 targets per man; entrance per team $10. Targets 2 cents each. Moneys divided 40, 30, 20 and 10 per cent.; twenty entries or over, five moneys. Lunch will be served on the grounds. Shells shipped to Mr. W. A. Gray, secretary, will be delivered on the grounds free of charge. No bang, no bird. Shooting commences at 9 o'clock.

The tournament of the Hudson River Trap-Shooters' League, to be held on the grounds of the Marlborough Gun Club, Marlborough, N. Y., Wednesday of this week, has ten events, three at 10, four at 15, and three at 20 targets. The entrance fee is uniformly $1, with the price of targets at 2 cents each added. Manufacturers' agents will be charged 1 cent for targets. The average money will be divided into five parts, namely $5, $4, $3, $2 and $1. All purses are divided according to the Rose system. The team race will be called at 1 o'clock; $5 will be given to the winning team. We would suggest to the secretary that to secure the full benefit of a review of the programme it would be better to send it in so it could be published the week preceding the tournament. At this tournament The American E. C. & Schultze Powder Co. trophy, the King Smokeless Powder Co. trophy, the Parker Bros. cup, and merchandise donated by the United States Powder Co. will be matters of contest.

The Worcester Sportsman's Club will hold an all-day shoot on Labor Day, Sept. 5, and intend to carry out their programme to the letter. The competition is open to all. The well-known sportsman, Mr. A. B. F. Kinney, has added to each event on the programme a sufficient sum of money to warrant the attendance and interest of shooters. Take Greendale cars and stop off at Huntington avenue. There are ten events on the programme, five at 10 targets, 70 cents entrance, $2 added; two at 15, 80 cents and $1.30 entrance, $5 added; one at 20, entrance $1.40, $5 added; two at 25, entrance $2, $5 added. The programme can be obtained of Mr. A. W. Walls, 6 Woodbine street, Worcester, Mass. No doubt but what this shoot will prove a gratifying success, as did the last one, of Aug. 3.

Under date of Aug. 4 Mr. H. J. Mills, president of the Bristol Gun Club, writes us as follows: "The Bristol Gun Club, Bristol, Conn., will give the fourth tournament of the Connecticut State League on their grounds, Aug. 25. Also it will give one of those sheep roasts of which all shooters who have attended speak so highly. All are invited. And to those who have never been to one of these sheep roasts, for which Bristol is so noted, I will say that they will never regret it if they come." Guns and shells sent to Mr. H. J. Mills will be delivered on the grounds free of charge.

At the Ocean City, Md., tournament, held on Thursday, Friday and Saturday of last week, the attendance was quite good, the two days' target programme calling out about thirty shooters. On the live-bird day, Saturday, Aug. 6, the chief event on the programme was the Ocean City handicap, 20 birds, $15, birds extra. There were ten entries, of which number W. Fred Quimby, Col. Thos. Martin, of Bluffton, N. C., and Jas. R. Malone killed all their birds and divided first money. E. D. Fulford was the only 19, and he won second money, $45, alone.

Under date of Aug. 4 Mr. F. G. Hogen, president of the Cleveland Gun Club Co., Cleveland, O., writes us as follows: "We are to hold our eighteenth annual tournament Sept. 21 and 22. The programme will consist of ten events, 150 targets each day. We add $10 to each event, or $200 to the programme, and it is also our intention to give at least twenty desirable average prizes. The indications are that we will have at least fifty shooters."

Well browned with good sunshine, hearty looking and bright of eye, Mr. J. A. R. Elliott dropped into New York last week, and concerning shooting matters he said that he had his eye on the principals in the Heikes-Gilbert matches, and in certain contingencies he might invite them to a debate for the trophies, in which his Winchester and Blue Ribbon powder would be his main argument.

Next week the main shooting events are the tournament of the Interstate Association, under the auspices of the Waterville Gun Club, Waterville, Me.; the Lake City Gun Club's tournament, Warsaw, Ind.; the nineteenth annual tournament of the Canton Gun Club, Canton, Ill., all on the same dates, Aug. 17 and 18.

Under date of Aug. 5 Mr. H. C. Lawrence, secretary of the St. Paul Gun Club, St. Paul, Minn., writes us as follows: "The annual tournament of the St. Paul Gun Club, which was to be held at the State Fair grounds, Sept. 6-8, has been declared off, owing to unavoidable circumstances. The 15th Minnesota Volunteer Regiment is encamped on the grounds, and occupy our club house."

The Montgomery Ward & Co. handicap live pigeon diamond badge is the title of a trophy launched by Montgomery Ward & Co., open for competition to the trap-shooters of Cook county. It is specially intended to encourage amateurs, as is fully set forth in Mr. Hough's communication in "Western Traps" this week.

The popular shooter and efficient salesman of the Hunter Arms Co., Mr. Harvey McMurchy, was in New York a few days last week. His description of California trout fishing and wildfowl shooting makes one feel that fishing and shooting in the East are meager and spiritless in comparison.

At Elkwood Park, on Saturday of this week, the chief event is the Elberon Handicap, 15 birds, $20 entrance, birds included; all stand at 30yds. Shooting commences at noon. Wednesday of next week is fixed for all-day sweepstake shooting.

In the Eureka Gun Club's shoot, Chicago, Aug. 6, C. Antoine was high man in Class A, he scoring 24 out of 25 targets. Dr. Carson, with a similar score, was first in Class B, and Burroff was first in Class C with a score of 22.

The tournament of the Brooklyn Gun Club takes place on Saturday of this week. John Wright has gone into training, so that he may devise even more pleasing shooting entertainment for those who will participate.

On Aug. 27, the Hingham Gun Club, Hingham, Mass., will hold an all-day tournament. A handicap event, 100 targets, will be the main feature.

The next tournament of the Philadelphia Trap-Shooters' League will be held on the grounds of the Silver Lake Gun Club, Aug. 27.

The New Utrecht Gun Club will hold a live-bird shoot on Labor Day in September.

BERNARD WATERS.

IN NEW JERSEY.

CENTRAL NEW JERSEY TRAP-SHOOTERS' LEAGUE.

July 30.—The Peters Cartridge Co., through their Eastern representative, Thomas H. Keller, gave a handsome cup to the Central New Jersey League, for competition. F. Hazlewood, Jr., made his first appearance, and as he has never fired over 100 shots he did fairly well. The next shoot takes place at Bound Brook, Aug. 13.

CHATHAM FISH AND GAME PROTECTIVE ASSOCIATION.

Chatham, N. J., July 30.—The ties for the prize Syracuse hammerless were shot off to-day. Only five of those who were in the tie appeared for the final. Elder and Unger were absent. The final event was at 50 targets, handicaps same as previous events, except that each contestant shot at the number or targets which in the first event was an allowance of deads. Drake, of South Orange, won the gun with a straight score. His work was clean and very creditable, as the shooting was much harder than on the previous Saturday. Geoffroy was not up his 98 per cent. gait, only breaking 48 with his allowance of 4 birds. Colquitt and Fiegenspan both shot a very plucky race, each scoring 49.

After completing this event a little race was shot for a couple of small prizes, 25 targets. Geoffroy won first.

Shoot-off for second prize, 10 pairs: Colquitt 5, Dukes 6, Budd 5.

Sweepstakes, 10 targets each:

It's a Matter of Teeth.

In a neck of the woods in an isolated part of Egypt, which is in the southern part of Illinois, there dwelt a certain wise man, called a Cadi, who was learned in the law; and strange to say, considering his profession, he was a lover of justice also.

He had a very rare accomplishment in addition to his acute knowledge of law; that is to say, he had more than an ordinary allotment of common sense, and could pass judgment on the questions of every-day life without reference to precedents, thus being governed by the circumstances as they existed and not by whether the like had happened before, and what action thereon had been taken by some long-forgotten legal predecessors, all of whom, whether wise or foolish, rich or poor, honest or dishonest, etc., rated alike in the art of precedent making.

He, having much hard cider in his cellar, gained the affection and confidence of his neighbors, who were wont to sit on their haunches on the woodpile, condemned barrels, swill buckets, old plows and such like other things as were scattered around the door-yard promiscuous-like, waiting to be invited, leaving the post of honor, the shade of the house, for their oracle to repose in while he pondered over the village problems daily presented for his sagacious rulings.

At such times, lost stolidly in thought, he much resembled the just Cadi of whom we all read in our school days, not those whom we saw at the World's Fair a few years since. However, there were a few minor exceptions which rather heightened his judicial aspect. Instead of a turban, he wore a soft felt hat, filled with dust and many sweatings about the hat band, with colors much faded by constant wear in sunshine and storm since his boyhood. Instead of crossing his legs and sitting on a divan, he placed his feet, encased in cowhide boots—which showed his robust bunions in sturdy profile—upon a shelf where the milk pans were drying, sitting the while on a work bench conveniently placed for the purpose and smoking a black, broken-stemmed clay pipe instead of a nargileh.

One hot afternoon, when the shade of the house and the company of his admirers were more than commonly grateful, and while he was solving some intricate questions on the perpendiculars of rainbows and the starting point of the south wind, two horsemen rode up.

"'Light," said the Cadi, without rising from his comfortable seat. "Hitch your horses, strangers. Where might you be goin'?"

Both men dismounted with a heaviness of manner which denoted a long ride. Walking up in front of the Cadi regardless of the open-mouthed onlookers who were roosting on such improvised seats as happened to be comfortably shaded, the taller one of the strangers said in earnest tones: "This man's a wolf!" at the same time pointing his finger at his companion.

"And what might you be yourself?" said the Cadi.

"I'm a lamb," was the reply.

"'S that so?" said the wise man. "P'raps yer wouldn't maind tellin' to the jury here how it all happened," and he winked at his habitual admirers as if to ask a suspension of judgment till he started his judicial brain a-whirling on its pivot.

"Well, you see, it's this way. We are trap-shooters. This man is a professional or an expert, it doesn't matter which to me, for the result is the same in either case. I am an amateur. I put up my money for sport, and this wolf comes along and takes it. That's what makes me a lamb and him a wolf."

"Does this wolf steal on you in the darkness of the awesome night, or sneak on you with wolfish cunning in the daytime?" asked the just judge.

"Can't say that he does. He puts up his money openly, same as I do, but I am an amateur, and he is an expert. He is a 90 per cent. man, while I am only an 80 per cent. man. There surely is something wrong somewhere when this state of things exists; and, existing, that it is permitted."

"Hum! I see! I see," said the Cadi. "I'm a 90 per cent. shooter myself; so I know all about your case. Let me interlocute yer somewhat. If you shoot for sport, why do you put any money up?"

"Oh, it's a lot more interesting when I have up some money. I feel then the spirit of the competition."

"Ah!" said the Cadi. "Then it is the money too that you are after. When the 90 per cent. man wins your money, what does he do with it?"

"I regret to say that he then puts it in his pocket. That's what hurts. We lambs don't want him around, and that's the very point upon which we want the judgment of so fine a jurist as you are famed to be."

"If you, an 80 per cent. man, were the best shot, what would you do to the 70 per cent. man?"

"I wouldn't do a thing to him."

"Now," said the wise Cadi, "when you, an 80 per cent. man, win the money of a 70 per cent. man, what do you do with it? Give it back to him perhaps?"

"No, I don't. But that's different, for we are amateurs. If the 90 per cent. men were out of the way, we amateurs would have a better chance, and the noble sport would be saved."

"Don't you think," said the Cadi, "that the 70 per cent. men then would object to the 80 per cent. men, same as the 80 per cent. men now object to the 90 per cent. men? The real difference is in the relative skill of the individuals, and not in the name of the class, for the term amateur may mean expert or novice. If the men who were better shots than 80 per cent. were all ruled out the 80 per cent. men then would be the experts, and the same relative position to the rest would then be held by them that the 90 per cent. men hold now. You object to being beaten by the 90 per cent. men, yet you take great satisfaction yourself in beating the men who shoot at a less degree of skill than yourself. You claim that you shoot for sport, though putting up your money in manner like to that of the professional, also shooting like unto him, yet talking meanwhile much of sport in theory while your center of effort is around the money in your practice. While losing your money to a better shot than yourself on the one hand and complaining thereat, you do the same thing to a shot weaker than yourself and are joyous thereat. The term lamb is a misnomer, for the lamb looks different and acts differently from the wolf, and most of all it does not invade the wolf's range and deliberately enter into a struggle with him. You are not a different species. You are all pleasant, amiable wolves, differing in size, teeth—some big, some little—but all with more or less of the commendable purpose of succeeding as much as possible within the true limits of the sport. I would further add—"

"Pardon me, sir, but I do not think that you quite understand what I came here for; and anyway you do not think as I do, and I don't believe a word of what you are saying. But I would like to take your decision back to the boys to show them that I came here in good faith, if you can deliver it in two or three words."

"It's all a matter of the sharpest and longest teeth," said the Cadi; and then turning to his friends he said, with a sigh, "We find the same thing in our business everywhere. I often think of the touching words of the poet on this subject," said the Cadi, as a grumous tear slowly sank from his left eyelid. "Let me read to you the following verse," and he took a scrap of paper from his pocketbook, and tuning up his voice he continued:

"'So, naturalists observe, a wolf
Has larger wolves that on him prey;
And these have larger still to bite 'em,
And so proceed, ad infinitum.'"

"It's on the barn," said Si Simpson, who was the acknowledged wit of the party.

"What is?" said the Cadi.

"The roof," said Si.

"It's on the house this time," said the Cadi. "What'll you have, boys?"

Trap Around Reading.

Reading, Pa., Aug. 1.—A meeting of the members of the Mt. Penn Gun Club, of this city, was held yesterday at the residence of Mr. Abner S. Laird, 330 North Sixth street, when preliminary arrangements for a two days' merchandise shoot at their headquarters on Mt. Penn were made. President William Smith called the meeting to order and Howard S. Dippery was secretary. The club decided upon Sept. 5 and 6 as the dates for the shoot, and already has 100 fine prizes subscribed by the different business men of this city. The principal event will be a team shoot for a handsome cup, which was presented to the club over a month ago, and which trophy the Mt. Penn Club will offer as an intercounty championship for teams of five men each. The members of these teams must be bona fide members of the shooting club they represent. The secretary was instructed to send communications to the following clubs, inviting them to compete in the team and also the two days' shoot: Florist Gun Club, Silver Lake, Frankfort, Southwark, Roxborough, Wayne, Independent, all of Philadelphia; Mahanoy City Gun Club, Phoenix Gun Club, of Phoenixville; West Chester Gun Club, of West Chester; Shuler Shooting Association, of Pottstown; Penn and Social gun clubs, of Norristown; Twin City Gun Club, of Royersford and Spring City; Boyertown Rod and Gun Club; Allen Gun Club and John Weiler Gun Club, of Allentown; Keystone Gun Club, of Lebanon; Independent, South End and East End gun clubs, of Reading.

The following were appointed a committee to take charge of the shoot and make the necessary arrangements: Albert Yeager, Harry Saylor, Howard Hill, Warren Brown, Abner J. Laird and Howard Dippery.

Reading, Pa., Aug. 6.—The Mt. Penn Gun Club, of this city, who are making arrangements for their two days' merchandise shoot, Sept. 5-6, have received many fine prizes and trophies, which will be shot for by shooters from all parts of the State. One of the principal events of the shoot will be the intercounty championship for teams of five men each, for a fine silver trophy, which is donated by the club.

Pottstown, Pa., Aug. 4.—The first of a series of three club shoots for the intercounty championship between West Chester Gun Club, of West Chester, Pa., and Shuler Shooting Club, of this place, was shot to-day at East End, the shooting ground of the Shuler Club. The background for shooting is fine, but to-day the glaring sun and a strong wind made target shooting very hard, and the record shows very low scores for the shooters. The West Chester Club arrived in Pottstown at 10:25 A. M., and were quartered at the Shuler House. The following gentlemen constituted the party: Messrs. F. P. Gill, F. H. Eaches, Thos. Ferguson, Thos. Sellers, Geo. R. Foulke, Wm. B. Jackson, John H. Twaddell, J. H. Lumis, Lewis Brooks, Benj. Plase, J. M. Hoar, Thos. Eaches, Fred Geisel, Paul Brinton. At 2 P. M. sharp the shooting began, when the first sweep, 10 targets, 50 cents entrance, was began. At 2:30 the two captains, Messrs. Gill and Wickersham, met and tossed, the West Chester captain winning and deciding to shoot his men first in the squad. The targets were thrown by the magautrap, which worked very well and gave entire satisfaction. Each team consisted of ten men, each man shooting at 25 targets. The Shuler Club had an easy victory, winning by 35 birds. The scores of both teams are very low and far below average. Messrs. C. F. McMichael, of Pottstown, and Harvey Cronser, of West Chester, officiated as referee and judge. Forest and Stream correspondent, who was present, was selected as official scorer. Sweeps followed, and continued until darkness set in. The score of the club shoot was as follows:

West Chester Gun Club—Sellers 14, Twaddell 13, Hoar 10, P. Brinton 14, Gill 15, Henry 13, Ferguson 14, Ford 18, Lumis 14, Foulke 17—142.

Shuler Shooting Club—Benner 20, Sheeler 17, Miller 23, Trumbauer 19, Wickersham 15, Saylor 15, H. Wein 12, L. H. Davis 17, Grubb 17, Slonaker 22—177.

The sweeps were as follows:

Springfield, Pa., Aug. 1.—This afternoon the sportsmen of this village met in McCord's field, near here, and held a target match, Sergeant system. The folks of this town had decided at a town meeting held some time ago to hold a grand holiday and raise money, by holding a festival, to be used for lamps and for improving the village. Springfield or Blue Rock Post-Office is a quiet little town, located in Chester county, near the famous banks of the Brandywine Creek, the home of the bass and sunfish. It is at this place, Springfield, that the Du Pont Powder Co., of Wilmington, have their proving grounds, at which all the grades of smokeless powder are tested. To-day was a gala day for the residents, as well as visitors, who came to have a good time. The morning was taken up by baseball, tennis and croquet games, the afternoon being taken up by target shooting and horse races. The sportsmen of the town decided to hold a target shoot, and purchased three bluerock traps and several hundred targets. The result is a gun club has been organized, and it is expected that at the next meeting, to be held in the second week of August, fifty names will be added to the list already signed. Mr. Ira McCord is the chief mover of the shooting club, and he has kindly consented to allow the club the use of what is known as McCord's field free of charge for its future matches. Thus far no officers were elected, which has been left until next meeting, but in the meantime the members are hustling for new members. The scores follow, all events at 10 targets per man, one man up to shoot at a time, except event No. 8, which was at 3 pairs doubles.

Norristown, Pa., Aug. 6.—The Social and Penn gun clubs, of this borough, held the first of a series of five shoots to decide the interclub championship at targets. Each club was represented by three of its best shooters, and each man shot at 50 targets thrown from a magautrap. The score follows:

Social Gun Club—Smith 44, Shambough 42, Derr 35—121.

Penn Gun Club—Ritter 43, Franklin 35, J. R. Yost 34—112.

The regular club shoot of the Social Gun Club for the gold medal then followed, and was won by T. V. Smith, who broke 23 out of 25 targets.

Duster.

Noel Money's Bear.

The legion of friends in America of Mr. Noel Money will be delighted to read the following from him, which is an excerpt from a private letter, which we have been permitted to use: "Just a line to let you know I am fit and well. I am writing this in my tent in the mountains close to the boundary of China, a grand place, full of game. Yesterday with my little .303 rifle I killed two bears at 90yds., right and left; neither ever moved afterward. It was a very pretty bit of sport. The .303 is a most wonderful weapon, both in its effects and in its accuracy. But about the Bears. We heard that twenty-two Tartar horses had been killed in a snowstorm in the winter about twenty miles away, so I went over, as I knew that as the snow was going fast there would certainly be bears eating the horses, and I could shoot them at night. After a search I could not find the horses. About 4 P. M. I turned back toward camp alone; my Tartar continuing to look for the horses in other directions. I saw on the face of the hill opposite me, about one and one-half miles off, two bears moving slowly along. The wind was wrong, so I started to ride as hard as I could to get around them. Soon I saw the bears were suddenly frightened at something, and were making off in a slanting direction toward me. I galloped over the most infernal ground for about a mile, then tied my horse up and ran down hill for half a mile as hard as I could, in the meantime not having seen the bears for fifteen minutes at least. When I reached a big rock pretty well blown and looked over I was immensely pleased to see the bears going full speed about 90yds. below. I gave a shout to stop them, and then shot the first one in the neck. He stood still, listening, and then I shot the second, also in the neck, as he looked at his companion to see what was the matter. Neither moved, but for a kick or two. It was a jolly bit of sport; great luck perhaps, with good shooting, but above all a piece of good hunting. I don't believe many men would have had hunting instinct to cut those bears off, or wind and legs enough to get there in time. I killed another big bear a few days ago at night sitting up over a dead horse. The other day I saw a huge bear on a hill, and started to stalk him. I must have got him had not a fool of a Tartar with a bag and animals, who were behind, shot at a hare. Off went the bear; very bad luck, as hares are extremely rare in the mountains. Bears are very big here, and this one was a monster. I shall probably go to England in November or December for a few weeks, and then back here again. It is very hot now and the mosquitoes are something awful. I would rather have a dozen New Jersey mosquitoes at me than two of these gigantic beasts, which bite like bull dogs." Mr. Money attained an enviable and deserved reputation in America as a most charming gentleman, but when it came to practical field sports, there were abilities he displayed which were not fully approved. For instance, in ruffed grouse shooting in the mountains of New Jersey he would take boulders, stumps, logs, etc., in his stride with no more apparent signs of distress of wind or limb than if he were taking a leisurely saunter before breakfast. The writer has a vivid recollection of one such experience, in which he was leaning up against a tree on a hot day, answering "cooey! cooey!" to the "cooey! cooey!" cry which meant to come together. Mr. Money suddenly appeared at the top of the hill and was much amused at the sudden zeal which seized the shooter in climbing the hill when caught resting, and thereby hangs quite a story. It is told of Mr. Money by Mr. Hunnewell, I believe, that when Mr. Money was in Maine, now nearly three years ago, their fox hunting party all started in hot pursuit of a favorite speedy hound, which was in mad pursuit of a fox. The athletic form of Mr. Money quickly drew to the front, and one by one or two by two the wearied hunters dropped out of the race. They formed in groups, sitting down to rest, discussing the circumstances and waiting for developments. After a time the chase was heard returning; the voice of the hound, however, having changed, and containing many notes of distress. It drew nearer and nearer, at length breaking cover. Noel Money was running at ease a few lengths ahead of the hound, which he was urging on, and the fox a few yards ahead, with eyes askance, watching the man and paying no heed to the dog.

Worcester Sportsmen's Club.

Worcester, Mass.—The Worcester Sportsmen's Club's tournament, held on Aug. 3, was one of the best attended tournaments ever given by the club. Mayor Rufus B. Dodge, of Worcester, and Mayor E. B. Hoitt, of Marlboro, accepted the hospitality of the club, and participated in the shooting for exhibition purposes and to entertain the ladies, many of whom graced the event by their presence.

Messrs. J. R. Hull, of Parker Bros., and Jack Fanning, of Gold Dust powder fame, were the shooting stars. Fanning won great applause by breaking 50 straight in the last two events of 25 targets each, but withdrew in favor of the ties on 23, who were Hull, Bowker, Hanson and Eager, the latter winning.

One of the most interesting events was that between the two mayors, who first shot at 10 birds to determine a handicap. Mayor Dodge broke 3 out of 10, Mayor Hoitt 7 out of 10. It was decided then that the former shoot at 16; the latter at 10. Result: Mayor Hoitt 9, Mayor Dodge 5.

Events 1, 3, 5, 8 and 11 were reversed. Nos. 2, 7, 10 and 13 were unknown. The remainder were regular.

Uxbridge Gun Club.

Uxbridge, Mass., July 30.—The medal shoot was at two 15-target events, regular, and two 10-target events, unknown angles. Owing to the shower, this was the only event shot. After 25 birds had been shot at Mr. Day, the holder of the medal, who was then well ahead, and shooting in good form, offered to call this no shoot and postpone it until next week, as the rain seriously inconvenienced the shooters; but they insisted upon shooting through the event, and the medal belongs "to him, and his heirs and assigns, to have and to hold forever."

WESTERN TRAPS.

NEW HANDICAP TROPHY FOR CHICAGO.

Chicago, Ill., Aug. 6.—We are to have a new live-bird handicap trophy for Chicago, something which we certainly need. The history of the so-called Chicago live-bird challenge trophy is well known. The most sportsmanlike part of that history is that portion pertaining to the actual shooting at Watson's Park. The city end of the trophy is not so free from criticism. It is not and never will be accepted by the shooters of Chicago as a representative emblem, for the conditions, even changed as they have been, do not seem to all the shooters to be open, stringless and free from taint, as conditions governing any amateur emblem should certainly be. Such as those conditions are, the trustees and the shooters have tried to respect and enforce them, but there has been too much petty spite and too many petty methods concerned with that unlucky trophy ever to allow it to attain very much dignity. Mr. Paterson brought it into news value by a long run of victories. Mr. Hicks defeats Mr. Paterson in a well-fought race. The shooters themselves have been the best part of that trophy, but there was wide-open room for another, one more harmonious in conception and more likely to evoke a gentlemanly and sportsmanlike feeling.

Realizing this need and seeing this opportunity, the firm of Montgomery Ward & Co., of Chicago, have come into the breach and offer a new trophy, which is very apt to forge rapidly to the front in interest at this city. There are several shooters in that big house, including Mr. Geo. Thorne, secretary; Mr. W. B. Leffingwell, advertising manager, etc., etc., and these gentlemen have been shooting a bit lately, and have taken an interest in our languishing condition here in the Chicago shooting world, where certainly grim-visaged discord has had a lead-pipe cinch for many moons. With quiet carefulness, the house has gone over the matter, and it seems to me the result is a set of conditions which we may call fair, sportsmanlike and worthy of respect. I beg to give a synopsis of these as formulated in a letter at hand early this week:

"On Wednesday, the 17th of this month, we will give the first of a series of trap-shooting events at Watson's Park, Burnside, Ill., at 2 o'clock P. M. There will be twelve of these shoots, given on the first and third Wednesdays of each month, until the series is completed. These events will be open to all shooters in Cook county, Ill., and will be known as the Montgomery Ward & Co. handicap live pigeon diamond badge shoot. To the one who wins the badge the greatest number of times in the twelve shoots it is to become his personal property. The winner at any event is to receive the badge, and can wear it until some one wins it from him. This badge will be a very suitable memento for the occasion.

"Each shooter is to shoot at 20 live birds, and be handicapped anywhere from 26 to 32yds., according to his known shooting ability, and to have such allowance of birds extra to shoot at as the handicapper shall give him. No shooter is to know his handicap distance before the shoot, but when he enters his name to shoot, the referee, Mr. John Watson, will tell him the number of birds he is to shoot at and the distance he is to stand from the traps.

"At each shoot there will be a second and third prize given by us. The second prize will be the refund of the entrance money, $4, to the one making the second highest score, and the third prize will be 100 of our best hand-loaded trap shells, loaded with any grade and quantity of powder the winner may elect, valued at $3. There will be no division of prizes. All ties must be shot off at the number of birds and distance stated by the referee.

"We want to stir up the shooters in Cook county, and we believe this will be the means of doing it. We desire especially to have amateurs attend these shoots, and the handicapper will do all he can to put them on an equality by placing them at a distance, and giving them enough extra birds to shoot at, so they will feel that they stand an equal chance with the best shots in the county."

ODDS AND ENDS IN THE WEST.

It will seem strange not to see a good trap shoot out at the State fair grounds at St. Paul, Minn., in the month of September, but it seems we are not to have it this fall. The St. Paul Gun Club announces the abandonment of its dates, as there are too many probabilities that the shoot could not be made a success. The medal of last year, indicative of the State championship, will be held over to the following year in its present hands. This was to have been the twenty-first annual shoot of the St. Paul Gun Club, but I trust there is nothing ominous about that coincidence.

Next week sees the sixth annual shoot of the Central Gun Club, of Duluth, Minn., Aug. 10-11. The shooting is at unknown angles, Rose system, 150 targets daily.

At the last week's club shoot of the Central Gun Club the following scores were made:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6
Targets:	10	10	10	10	15	15	Targets:	10	10	10	10	15	15
Flynn	5	6	7	2	3	4	Noisey	10	9	8	10	11	12
Greener, Jr	7	5	8	8	8	8	William G	..	5	2	9	7	2
Brown	4	3	5	..	..	..	Wassen	9	10	9	6	14	11
Duchess	7	9	6	10	5	..	Nervey	4	6	8	8	4	..
Bennett	7	8	8	10	9	7	Greener	9	9	8	7	13	12
Nelson	9	9	8	9	14	14							

Crookston, Minn., will hold a two days' shoot, Aug. 16-17. Amateurs only.

Milwaukee Gun Club's tournament, concluded Sunday last, was a fairly successful amateur event, with some sixty or seventy different entries in the two days. A number of amateur shooters came in from adjoining towns. It was practically all targets, some at the Jack Rabbit system. Haertle, Deering, Lea, Meunier, Farmer, Marsh, C. Schmidt and Cantillon were among those taking top honors.

Mr. W. A. Gray, secretary of Sidell, Ill., Gun Club, writes me regarding the big amateur tournament of that organization, to be held Sept. 7-8: "This promises to eclipse any of our former efforts, if we are to judge by the number of entries coming in for the 100 live-bird event, in which we offer $75 to the winner." I should think that a big live-bird sweep with such conditions ought to bring together a lot of good amateurs, and though the birds will be going better by the month of September, I venture to predict that it will take a score of over 90 to win the prize. Sidell programme looks inviting.

Canton Gun Club's two days' shoot, earlier mentioned, Aug. 17-18, will use the Sergeant system. The programme says this shoot showed forty guns present the last tournament, and more ought to be on hand this time. I looked over the programme to learn whether or not it was wide open. On the top of it is the suggestive word "Amateur." There is a good deal of that sort of thing this season.

Jack Parker managed a good shoot at Lansing, Mich., last week for the Michigan Trap-Shooters' League. The next tournament of the organization will be at Grand Rapids, Aug. 22-23. Grand Rapids won the team shoot last, Davison, Widdicomb and Holcomb scoring 59 out of 75. Detroit was second with Parker, Marks and Stone, who got 57. Jackson with Thompson, De May and Tracy had 54. Mason, Lansing and Howell followed in the order named.

Stone, of Detroit, won the expert medal contest in a draw with Widdicomb, of Grand Rapids, each breaking 23 out of 25 birds. Parker scored 22, Waruf 21. Scott, of Grass Lake, won the semi-expert trophy, scoring 21 out of 25. The amateur contest was won by Casper Schelling.

King Smokeless Powder trophy was won by Thompson, of Jackson, who broke 22 out of 25.

E. Hough.

1200 Boyce Building, Chicago, Ill.

GARFIELD GUN CLUB.

Chicago, Aug. 6.—The medal shoot of the Garfield Gun Club to-day resulted in the following scores, Kuss winning the Class A medal, Young Class B, Demaris Class C:

Philadelphia Trap-Shooters' League.

July 30.—The fifth shoot of the second series of the Philadelphia Trap-Shooters' League was held on the grounds of the Frankford Gun Club. There were two sets of traps, one of five expert, one set in the manner of the Sergeant system. There was the remarkably good showing of nine clubs on hand, and about fifty contestants in some of the sweeps.

The team match began about 1 o'clock.

The Washington Gun Club won on a score of 158. W. Bourne won the Peters Cartridge Company trophy. The business affairs of the competition were in charge of Mr. Howard George, assisted by Mr. Ed Beck, secretary of the Frankford Gun Club.

The Forest Gun Club shot with a four-men team.

Greenfield Gun Club.

Pittsburg, Pa., Aug. 3.—Good averages were made by most of the shooters to-day at the club's regular monthly shoot. Fleming led with an average of .880, and Bessemer was a good second with .860. Pillow, Pills, Born and Cochran had each an average of .800 or over:

Events:	1	2	3	4	5	6	7	8	9	10
Pillow	12	13	12	11	14	15	13	12	11	11

Sidell Gun Club.

Sidell, Ill., July 30.—The Sidell Gun Club received their magautrap last week, and placed it in position at their new shooting grounds. We held a practice shoot to-day. Quite a crowd witnessed the initial shoot over the magautrap and everyone was well pleased. The breakage was exceedingly light. The scores were cut down quite a little from the general average. Below are the scores of the club. I send you the programme of our next tournament. We mean to make it a good one, and the 100-target event ought to bring out the boys:

Events:	1	2	3	4	5	Events:	1	2	3	4	5

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, AUGUST 20, 1898.

VOL. LI.—No. 8. No. 346 BROADWAY, NEW YORK.

PRIZES FOR AMATEUR PHOTOGRAPHS.

THE FOREST AND STREAM offers prizes for meritorious work with the camera, under conditions which follow:

The prizes will be divided into three series: (1) for live wild game; (2) for game in parks; (3) for other subjects relating to shooting and fishing.

(1) For live game photographs three prizes are offered, the first of $50, the second of $25, and the third of $10.

(2) For live game in parks, for the best picture, a prize of $10.

(3) For the best pictures relating to FOREST AND STREAM's field—shooting and fishing, the camp, campers and camp life, sportsman travel by land and water, incidents of field and stream—a first prize of $20, a second of $15, a third of $10, and for fourth place two prizes of $5 each.

There is no restriction as to the time nor as to where the pictures have been made or may be made.

Pictures will be received up to Dec. 31 this year.

All work must be original; that is to say, it must not have been submitted to any other competition or have been published.

There are no restrictions as to the make or style of camera, nor as to size of plate.

A competitor need not be a subscriber to the FOREST AND STREAM.

All work must be that of amateurs.

The photographs will be submitted to a committee, who, in making their award, will be instructed to take into consideration the technical merits of the work as a photograph, its artistic qualities, and other things being equal, the unique and difficult nature of the subject.

Photographs should be marked for identification with initials or a pseudonym only, and with each photograph should be given, answering to the initials, the name of sender, title of view, locality, date and names of camera, and plate or film.

THE COLORADO BUFFALO.

IF any State or county or township within the United States had ranging within its borders a small herd of mastodons, we can imagine that the residents of that section would be immensely proud of their unique possession. Everything possible would be done to foster and care for this herd, every attempt to injure it, or any of its individuals, would call forth a burst of indignation from the whole community, and all the machinery of the law would be set in motion to punish the individual who had thus flown in the face of public sentiment. Every increase of the herd would be an occasion for rejoicing. It would be guarded with the same care that is given to the collection of animals and birds in our public parks and zoological gardens.

In two or three places in this country there are small groups of mammals which are nearly extinct, and whose possession ought to be to any State a matter of the greatest pride. One would imagine that to these buffalo found in Colorado, Idaho, Wyoming and Montana there would be no more danger from residents of the State in which they are found than there is to the animals in the Philadelphia Zoo from the policemen employed there; that local pride and regard for the good name of their State would be sufficient safeguards from all hunters at home, and that the only possible danger to these little herds would be from outside marauders, jealous of the eminence of the State distinguished by such a possession. The buffalo herd mentioned by Mr. Byers should be as safe from dwellers in the State of Colorado as is the great bull in the Denver Park, and no effort should be spared by the State authorities to protect it. The public sentiment of the State is strong for such protection, and we can well imagine that active efforts by the authorities to enforce the law will not be wanting. Even more effective than these efforts should be the co-operation of the residents of the section where the buffalo roam. If these settlers can be made to feel that these buffalo are theirs, to be cared for and protected, he will be a bold man who shall try to kill one. A feeling of local pride and proprietorship in this little herd will do more for its increase than anything we can think of.

It is almost twenty years since we have seen this little herd of buffalo, and as shown by Mr. Byers, it has had its ups since then, and its downs. We hope that its numbers have not been overstated in the note referred to, and that it may continue to increase. If the numbers of her buffalo have been correctly stated, Colorado today has very likely more wild buffalo than any State in the Union.

JERSEY MERCY.

"JERSEY JUSTICE" is a proverbial term expressive of hard and bitter punishment. Jersey mercy then might be taken to mean mercy of that brand whose quality is not strained, and "blesseth him that gives and him that takes," provided he gives and takes honestly.

The monthly reports of Fish and Game Protector Shriner are chiefly records of Jersey justice, giving long lists of arrests, prosecutions, fines and incarcerations for Sunday gunning, killing song birds, net and set-line fishing, robbing birds' nests and the like; but the story is hardly ever devoid of an admixture of merciful dispensations, such as the remission of fines, suspension of sentence, or return of confiscated apparatus to guilty defendants. One noteworthy record of a magistrate's kindness of heart is contained in Mr. Shriner's current report. It was in the cases of Andrew Fitzman and two Italians, who were brought up before a Passaic justice for violating the game laws. Their guilt was established and they were fined; but the justice subsequently reported to the commission that he had been unable to collect the fines, and the men being desperately poor, and having large families dependent on them, he had deemed it inexpedient to jail them, and had set them at liberty with an injunction to sin no more. This was manifestly a creditable entry on the commission records, and the course of the Passaic magistrate was approved by those who believe that justice, even Jersey justice, should be tempered with mercy. The only individual dissatisfied appears to have been the deputy game garden; and he having instituted an investigation, succeeded in demonstrating that Passaic official mercy is of a very unique and peculiar character when manifested in game cases. It turned out that the Passaic justice had actually collected the fines from the poor men with large families, had put the funds so accumulated where they would do him the most good, and had made a lying report to the commission. His pretense of mercy was a cover to thievery. Indictment, a fine of $200 and costs, and restitution of the moneys belonging to the commission followed in due order; and the facts are set forth in Mr. Shriner's current report.

CANADIAN SALMON RIVERS.

IN another column is published a letter addressed by Mr. Chas. Stewart Davison, of this city, to the Department of Crown Lands at Quebec, respecting the condition of the salmon fisheries of the Province. We invite careful reading of the communication. It is a comprehensive review of the past and present of Canadian salmon fishing, an intelligent consideration of the causes which have effected existing conditions; and a clear statement of the remedies which, and only which, can restore the fisheries and preserve their value.

Mr. Davison's prime purpose in printing his letter in FOREST AND STREAM is to elicit from other salmon fishermen of experience on Canadian streams such experience and testimony as in addition to his own may enforce the argument here made for a new system of conservation on the part of the Provincial authorities. The interests at stake are of such magnitude that the duty of contributing to the information of the Department should be recognized and met. We trust that Mr. Davison's public spirited efforts may thus be seconded.

SNAP SHOTS.

The summer weekly half-holiday idea is gaining ground. From the larger cities, where Saturday afternoon is commonly observed as a half-day "off," the custom is extending to smaller towns. Here one obstructive factor to be reckoned with, reasoned with, argued with, cajoled and won over, is the tradesman who refuses to shut up shop when the rest do. Manifestly in a small town the merchants must all act together, that one by keeping his shop open may not take unfair advantage of the rest, who close. This, however, is something that will adjust itself as the holiday principle takes stronger hold.

City people realize the advantages of holidays and vacations more than do country dwellers; yet it is a mistake to assume that town folks require change more than their country cousins. Life on the farm would be fuller, richer, and more attractive, if the year-around routine were more frequently broken by holidays and vacations. In large part farmers do not get the good even of such established holidays as Fouth of July; for, instead of taking a day off and going fishing, the chances are that all hands, including the boy, get in hay or give themselves up to some such joyous pursuit. The true principle is to get all the good we can out of life as we go along; and that means a holiday now and then, even for farmer and farmer's boy.

Mr. Titcomb's account of the organization and methods of the Vermont Fish and Game League is a valuable contribution to the ways and means of game and fish protection. It is a story of successful effort; and the success has been attained by hard work. It may be said here, as the modesty of the author of the paper naturally prevented being said there, that the one man was Mr. John E. Titcomb. The conception of the League was his; his were the methods of its establishing and direction; and to him in generous measure belongs the credit of its achievements.

A Western fish commissioner who is preparing his biennial report, and wishes to impress the people of his State with the value of the fisheries, asks if there are any reliable data as to the commercial value of an acre of water. It is stated by some authorities, he says, that an average area of water will produce five times as much as an average area of land; and again, that an acre of water will produce a ton of fish per annum. We have all seen these statements, or variations of them; but they amount to no more than many other loose assertions made by people who talk at random and without much thought as to what such a declaration actually means. Are there any reliable statistics showing the value of an acre of water devoted to fishculture? Is it a proposition admitting of definite statements?

Following their beautiful volume of the report of 1895, issued last year, the New York Commissioners of Fisheries, Game and Forests now send out the report for the fiscal year ending Sept. 31, 1896. In proportions, style and illustration the present volume ably maintains the high character set by its predecessor. Opinions may differ respecting the advisability of appropriating such sums as must be involved in the publication of these public documents; but that is something for the Legislature to determine, and if they vote to have fish and game and forestry reports which are fine examples of book making as well as series of statistics and intelligent papers descriptive of intelligent work, the fortunate recipients of the book will be unlikely to do otherwise than congratulate the commission on its privileges.

It is unfortunate that so great an interval should elapse between the period concerned with the report and its issue; but this appears to be a condition inseparable from public documents. A noticeable fact in this connection is that certain recommendations contained in the report have already been adopted and acted on by the Legislature, notably Chief Protector Pond's declaration of a change of conviction respecting the hounding of deer in the Adirondacks, and his recommendation that the practice should be abolished—as it has been by the law now in operation.

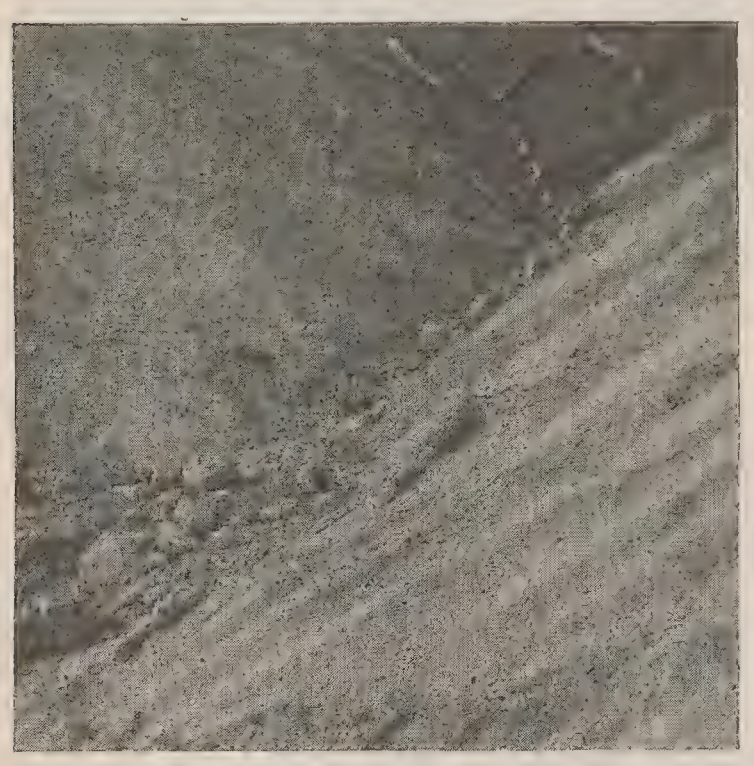
Aside from the report proper, the volume contains some papers of interest and value, among them: "The Black Bass and its Distribution in the Waters of the State," by Mr. A. N. Cheney, who writes also of "Brook Trout and the Conditions Favorable to Their Propagation," and "The Pike Perch." "The American Saibling," by Prof. John D. Quackenbos; "Oysters and Oyster Culture," by Commissioner Edward Thompson; "Notes on New York Fishes Received at the New York Aquarium," by Dr. T. A. Bean; "Ruffed Grouse, Woodcock and Quail," by H. A. Surface, of Cornell; "A Forestry Experiment Station," by Wm. F. Fox, and "Stream Flow in Relation to Forests," by Geo. W. Rafter. There are colored plates by Denton of Sunapee trout, male and female; brook trout, male and female; pike, perch, landlocked salmon or ouananiche, and lake trout. There are numerous other views of the Adirondacks and fishing and hunting incidents.

The Sportsman Tourist.

Death Gulch.

Gardiner, Mont., June 7.—*Editor Forest and Stream:* About ten days ago one of the Government scouting parties reported eleven dead bears in Death Gulch, on Cache Creek in the Yellowstone Park. As I was in want of fresh air, I thought I'd make a trip to the gulch, and if possible get a few pictures. Arthur Barron and I, with our saddle and two pack horses, started one Sunday morning, the first pleasant day for over two weeks.

Our ride of twenty-five miles to Yancey's was interesting, but we saw very little game, nothing worth mentioning. Most of the game had moved away back from their winter range. We camped one night at "Uncle John's," the next day started for Soda Butte station—twenty miles. On the way we saw our first young elk calf on Specimen Divide; it crossed our road just in front of us. There were hundreds of elk in sight lying down and feeding. While we were passing one large band near Big Specimen, we heard a bull whistle. There was no mistake. I turned to Arthur and remarked, "Who says bulls never whistle except during the running season?" It is very seldom one does hear one whistle out of season, but they can if they wish to. We saw a very few antelope, all but one were very wild; this one buck watched us pass at 150yds. without moving; the others ran as soon as we came in sight. They said, "There come some of those Gardiner fellows who shot at us last winter," and "lit out," only "touching the high points." I did not see any young ones, and had no time to hunt them.



We camped Monday night at Soda Butte, where we enjoyed one of our mountain snowstorms. In the morning the whole country was white, the snow covering the ground to a depth of 1½in., the larkspurs, violets, small yellow lilies and other flowers sticking up through the snow, and frozen. There was a skim of ice over puddles in the road. We got an early start from the Butte, and crossed Soda Butte Creek by a ford before the snow began to melt much. On the bench where the old game-keeper's cabin is we saw our first game, an antelope, that ran as soon as it caught sight of us. We saw a large band of elk across Lamar River, but too far to count. A mile further, as we climbed to another bench, turning up Lamar toward Cache Creek, we began to get close to elk. First were three bulls, their horns just beginning to branch out; one, a spike, had only one horn; we could not see even a lump where the other ought to have been; the one horn was about 18in. long. They did not see us until we got quite close, although they would raise their heads and look our way. We were riding up a little gulch almost under them. We counted twenty-eight elk in the band. We saw other bands, some to our right below us, others just ahead in the trail, and some up on the mountain side. As we came in sight they moved on all in one direction, until there were a few over 200. At one time they were in one long string along the trail climbing the open mountain side. They all stopped to have a look at us and the soldiers with Scout Morrison, who were overtaking us on the trail. Arthur and I were sitting on our horses counting the elk, when one old cow suddenly started off down hill toward the mouth of Cache Creek, and away from the other elk; soon others began to follow until about half of the herd went with her. I counted 110 in this part of the band. Some of the others hesitated which way to go, because the head of the band was going out of sight up over the high ridge. One or two more went down, and about thirty kept along the hillside, while others went on up. Just before we reached Cache Creek we saw other bands of elk, and quite large bands. Even at our camping place we found a few on the creek bottom; in all there were not less than 400 between Soda Butte and Cache Creek. A large proportion were last year's calves—yearlings.

Morrison and the soldiers threw off their packs in the pine timber above the trail, while Arthur and I left our packs in the open by some willows. Picketing our horses, the soldiers let their two pack animals—Mike and Butte, two mules—follow, and we all started for the gulch, about two miles up the creek. We rode up the left bank to a small park just opposite the mouth of the gulch, and in this we saw a few elk at a lick. We crossed Cache Creek by a rough ford, tied our horses in some timber. One of the mules, Butte, refused to follow, preferring to camp in the park, where the feed was good, at the same time having the other horses in sight. We all climbed the steep mountain side away from the gulch until we were about 200ft. above the creek, when we came to the edge of Death Gulch. We walked up about 100ft. further, then went down into it. We had no fear of poisonous gases, as there was a strong wind blowing. True, the sulphur fumes were not very pleasant to smell, and the carbonic acid gas made our heads ache a bit; but it was not strong enough to be dangerous.

I found quite a stream of water running down the gulch from the melting snow above and the recent rains. The wash from the water was so great that it had carried off all the small things like flies, birds and some parts of the bears. There were parts of eleven bears in the gulch; but the stock has been many years getting up to that number. A cub had been carried off by a large bear, whose tracks I saw all around the edge of the gulch, and going into it, and whose bed I saw under a pine tree; but the bear itself I did not wish to see, unarmed as I was. Judging from its tracks it was a huge fellow, and would tip the beam between 600 and 700lbs. I would have liked to have his picture. There was a dead red fox in the gulch that was in a very good state of preservation. The last bear to have lost his life there had been skinned by the soldiers, but the skin proved worthless. I took shots at the fox and three of the bears with a small camera. The fox may show up, but there was so little contrast between the color of the dead bears and the dirt in which they lay that I can't expect much of a picture. The water had carried sediment over the bears, and the sun and water had bleached their already grizzly hair until they were of a color of the bottom of the gulch. Arthur and the soldiers gathered a few claws, which showed that the bears were all grizzlies.

POSED FOR THE CAMERA.

DEATH GULCH.

Photo by Mr. E. Hofer.

I climbed the other side of the gulch to get a general view. The gulch is a very narrow V-shaped cañon-like cut in the mountain side, the sides are very steep, and in some places almost perpendicular. The whole country is like much of that to be found in the Yellowstone Park—the formation having been altered by the gases working up through. At the time of my former visits to the gulch there was no water running out of it, but that was during the dry season. Then there were noted as victims to the gas flies, butterflies, small birds, a rabbit and five bears. Often porcupines are overcome by the gases. All these small things are carried off by the water during the spring, when the snow above is melting. I think there is little danger to visitors if they will not stoop too low. The poisonous gas cannot be deep at any time, for the fall of the gulch is very rapid. It is possible for just the right kind of a breeze to dam up the gas for a short time, or a snow bank may act as a dam, since the ground is not what is known in the park as "hot country," though very much like it. There was a circular boiling spring close to where we left our horses; it looked like thousands of hot springs in the Park, but the water was cold. On Cache Creek and in the bottom of the creek is lots of old geyser formation, and gases are coming up through the water continuously. The gulch was first described, I believe, by Mr. Walter Harvey Weed, of the U. S. Geological Survey, in 1888, when the remains of five bears, one elk and several small things were found.

IN DEATH GULCH.

Showing Bear Skull and Bear.

After I had climbed out of the gulch I took a few views and started for the horses. Looking across the creek, I saw the mule Butte and two elk feeding in the little park where the lick was. I hurried down to the horses and forded with mine, ran along under the bank to a good position, and made some exposures on the mule and elk feeding together. Soon the others came and we returned to our baggage. We put up tents and got lunch. As the day was clear I did not attempt to change spools in the "daylight camera" until dusk; then I found that the film had not run smoothly on the winding spool, but had run to one side. I don't know how many pictures are spoilt; but I put in a new cartridge and in the morning made another trip to the gulch for pictures; but I lost the mule and elk picture. There is no danger of dead bears running off, but mules and elk are not feeding together every day where they can be photographed.

After making the second trip to the gulch, we packed up and drove to Big Specimen, where we camped in the rain. During the night it blew a gale, and as the tent was in a very exposed place, we thought it would go down; but it stood the storm well. It is what I call a teepee tent, being more like a lodge than a tent, and it stands all kinds of blows. In the morning I took a shot at the beautiful little falls of Amethyst Creek. I tried to get a shot at a grouse, but the plaguey thing would not stop a second in the sunshine, but only in the shade. I was close enough to get a good picture, but there was no use snapping at the bird in the shade.

About 10 o'clock we packed up and started over Specimen Divide by the old trail, my intention being to get a shot at a young elk. I found a band where I expected to, and where I had captured several for the National Zoo. The elk were quite a way from timber, and by hurrying we made one of the cows cache her calf out in the grass; another left hers in the edge of the timber—quaking asp and spruce. I made exposures on the first calf as it lay; and then went to the other, but it would not pose. It was a very unwilling subject. Arthur had to hold it up so that I could get a shot or two. Then it started to follow me until I pushed it down. When we left we saw the mother elk watching us at a distance. She found her young all right. I was surprised to find so few calves. Two years ago at this time I had seen over a hundred in the same section, and now there are more elk. I judge from this that the calves are not dropped so early some years, this depending on conditions of food and climate during the autumn or running season.

BABY ELK.

Bears and mountain lions have been making some trouble this spring. The mail contractor, whose home is at Soda Butte, complains of losing one calf and two yearlings by a lion; and he has a bull whose neck has some ugly cuts in it, and whose flank shows the marks of a lion's hind claws. Mr. H. E. Klamer has lost several sheep by bears, and I have mentioned in a former letter the loss of a horse at Norris by a bear.

At Yancey's a bear has been around so often that Uncle John dare not keep his calves penned, so we had to use condensed milk there, while the cows were running out with their calves.

We saw considerable beaver sign while on our trip, but it rained so often and was so cloudy I did not get any photographs of the dams and houses, as I intended. I got home Sunday in a rainstorm, but very well satisfied with my trip if I only get a picture out of it.

E. Hofer.

We append Mr. Weed's description of Death Gulch, as contributed to the New York Evening Post:

The writer, who has spent the past six summers studying the geological phenomena of that region, discovered the now famous Death Gulch last year, and submits the following description of the same as the result of personal observation:

It is situated in the eastern portion of the Park, in an extremely rugged mountainous region; a country seldom visited save by occasional travelers to the mining camp of Cooke, or hunting parties en route to the weird scenery of the "Hoodoo" country. The mountains are from 10,000 to 11,000ft. high, and the streams flow through narrow valleys and cañons, with precipitous walls 2,000 to 3,000ft. high, that often show great numbers of upright fossil tree trunks, standing where they once flourished on the flanks of some ancient mountain before they were covered by the ashes and stones of volcanic eruptions. The Lamar River is the largest stream draining this region, and it is on a considerable branch of this that our American upas valley was found. As usual in this, the home of the wapiti or elk, a well marked trail leads up the creek, affording easy traveling on horseback through open meadows and thick grove

of pine. About two miles up Cache Creek the trail leads into a little glade in the midst of thick pine timbers.

Even at first sight there appears to be something unusual and peculiar about this little opening in the pines; in the center is a shallow depression that is bare of verdure, the surface white with an encrustation that proved to be salt, while the converging and deeply worn trails leading to it, and the numerous game tracks, show it to be what in the hunter's vernacular is called a "lick." It is the dried bed of an ancient hot spring that is now a shallow alkali pool in the early spring. Crossing this little meadow, we found the creek cutting its further edge, while the white slopes on the opposite side, and the smell of sulphur in the air, suggest at once to those familiar with "Geyserland" the presence of hot springs. Picketing our horses where they might graze upon the salty grasses that grow about the "lick," we descended the bank to the border of the creek, and found its waters flowing between smooth white walls of polished marble, and an expansion of the stream bordered by this creamy white rock forms a natural bath reservoir that even the luxuriousness of ancient Rome could not have equaled. In the center the water is boiling furiously, the bubbling mass rising several inches above the surface of the creek; but the water is quite cold, the commotion being due to the copious emission of gas from some vent in the bed of the stream. Over this spring a stranded log reaches from bank to bank, and served as a foot bridge, which we crossed with that sure-footedness born of the knowledge that our clothes could no longer be spoiled by a wetting should we fall in.

On the further side of the creek we first notice a low mound of red material evidently iron ochre, and just beyond is a spring now depositing this substance. The water, clear as crystal and icy cold, issues from the center of a little bowl of ochre, surrounded by the brightest of green moss. We were curious enough to taste this water, and found it slightly acid, highly charged with gas, and tasting like our soda water. But it is the surface of the little basins and pools, filled by the overflow of this spring, that interests us most, for the surface of the water is covered with an ever-varying iridescence whose brilliant tints put to shame the hues of the peacock's tail, and surpass the changing fires of an opal. This feast of color, with its kaleidoscopic changes, fascinated us, and many minutes were spent watching it before ascending to the summit of a little platform overlooking this spring. The slope is formed of a gray rock, whose riffled surface at once suggests the terraces of travertine, the so-called "formation" of the Mammoth Hot Springs. It is indeed the same deposit from hot springs, but altered and crystalline, the material nearer the stream resembling a coarse moss, petrified into white, nearly transparent crystals. The lower layers are, however, nearly as dense and hard as flint, and it is this material that forms the marble banks of the creek, where its surface is polished, until it is as smooth as glass, by the stream itself.

But it is neither this deposit nor the bank of sulphur a few yards further up the creek that distinguished this place from all others in the Park, though the sulphur contains cedar logs embedded in it that are ready for lighting, the wood being so impregnated with sulphur that a splint of it will burn like a match, while the black water oozing from under the bank would make a really "jet-black" ink. It is an innocent-looking little gulch that runs down the slope at right angles to the creek, that makes the place worthy of this notice. This little ravine, scarce 50ft. deep, has steeply sloping sides of chalky white decomposed rock, as soft and loose as sand or clay. A little water runs down the narrow bed of the gulch, cold and sour, puckering the mouth with the peculiar astringency of alum. Turning aside to explore this place, we ascended the ravine, finding it rather difficult walking in the little stream bed, and hard work getting up several draps, where the stream forms miniature falls of 5 or 6ft. Above one of these tiny cataracts we first noticed a white, or rather creamy, seductive-looking substance in the stream bed. This was so like genuine country cream that it was hard to believe it a purely mineral substance, but such it is, and formed about the minute oozing springs which issue from the bottom and sides of the gulch. It was here too that we first noticed a sulphurous odor and a slight oppression of the lungs—the irritating effect of the fumes of a sulphur match accompanied by a choking as if from lack of air. We paused a moment to rest, and found ourselves strangely fatigued for so short a climb; but several gusts of the fresh northwest wind filled our lungs with new vigor, and we continued our clamber up the gulch.

With heads bent and eyes eager to note the curious deposits in the ravine bottom, it was not until quite close to him that we noticed an immense grizzly bear but a few yards ahead of us. Startled by so sudden and so close an encounter, we instinctively gave a leap up the steep slope, well knowing that the up-hill side is the safest when a bear is near and no trees handy. But while we scramble a second look is more assuring, and though the shaggy head rests as if asleep in the warm sunshine, something in the expression and attitude induced us to utter a trial shout which elicited no response from Brer B'ar. Instantly relieved, and laughing at our fears, we slid down the slope and landed beside a huge specimen of the most formidable of all the wild animals of the Rockies—a silver-tip grizzly—whose long claws and sharp teeth showed evidence of having done good service. Fat as butter, and possessing a thick coat of fur that would have sold for a small fortune in a New York furrier's, he seemed ready for his long winter nap. Rolling him over, we could find no bullet holes, no mark of violence; the only sign of injury being a few drops of blood beneath his glistening black nose. That he had been dead but a short time was certain, for there were no flies, and the carcass was fresh and natural-looking.

How had he met his death? was the question we asked each other, and at first it seemed an enigma. But, stranger still, beside him lay the decaying remains of yet another bear, also a grizzly, and above this, a few yards up the gulch, the fur and bones of other bears, five skeletons being counted besides the ribs and shoulder-blades of an elk. While looking at this strange sight, reminding one of the death chamber of the Chinese or the burial place of the Parsees, we find ourselves faint and dizzy, and suddenly realize our own danger. Climbing quickly up the slope until the fresh breeze restores our strength, the mystery is solved. It is carbonic acid gas that had filled our lungs, and, had it overcome us, might have added our skeletons to those of its victims now lying in the gulch. Descending again, we risk possible asphyxiation to test the gas with a strip of lighted paper, which it quickly extinguishes—confirming our belief as to its presence. Above the elk bones we found several dead birds, a rock hare, and numerous lifeless butterflies, besides a red squirrel—a pretty little fellow, suffocated, like the others, while crossing the gulch.

The explanation is now simple enough. The hot springs which once flowed from these slopes are now things of the past, but leave their record in their deposits and the white slopes of decomposed rock; but they are succeeded by invisible emanations of gas, mainly, no doubt, carbonic acid. This, as is well known, is heavier than air, and if emitted abundantly will collect in hollows and depressions in the slope, and any animal unwary enough to venture into the ravine when the air is still risks suffocation by the gas. It was doubtless the remains of some such unfortunate that tempted the first bear, whose remains served in turn to attract another, and he yet another, until seven in all have perished. The gulch is, therefore, a veritable death trap, a natural charnel house, whose victims are not yet numbered.

Hastening from this scene of desolation to the bench above, we are in thick pine timber, whose balsam odor is refreshing to our lungs, while the shrill chirrup of a squirrel, scolding at our intrusion of his estate, and the noisy call of a Canada jay, assure us that we are beyond the reach of the invisible hand of Death, and again in the land of the living.

WALTER H. WEED, U. S. Geological Survey.

Natural History.

Owls, Mice and Moles.

Questions in Economic Zoology.

IN their simplest form some of the questions put to nature by the economic zoologist of to-day are easily answered. Take, for instance, the status of certain insects popularly known as the potato bug, June bug and cut worm, which the veriest tyro in entomology or agriculture recognizes as an unmixed evil. But when we consider the higher types of animal life in their relations to man's interests, the problem becomes more complicated. In many instances, as that of the crow, or of certain species of hawks and owls, or of such quadrupeds as the weasel, the mole and the jumping mouse, as well as in some species of reptiles, there is such an intimate blending of what we are pleased to call either "noxious" or "beneficial" that some are tempted to think it none of our business to interfere. Indeed, many honest people are convinced that our efforts to regulate economic conditions only increase the evil.

Under the old regime of selfish ignorance there has been abundant cause for such a charge, but now, thanks to the persevering efforts of our scientific men, and the wise National and State legislation which has established our Departments of Economic Zoology in the United States, we can say most emphatically that it is our duty as well as our business to spend and be spent in this branch of research. This is evident not only from the utilitarian but also from the æsthetic and altruistic standpoints. As a result of the enlightened study of the food-habits of our North American hawks and owls, we find that many, nay, the majority, of our birds of prey, outlawed and persecuted since Pilgrim times, have been our friends in every sense of the word. It is already difficult to believe that this verdict is largely the result of studies carried on in the United States during the last decade.

But, as Dr. A. K. Fisher has wisely quoted in his prefatory remarks on "Hawks and Owls from the Standpoint of the Farmer," "a little knowledge is a dangerous thing." In the present paper it is my wish to call attention to some of the facts which have been overlooked or too greatly discounted, owing to the phenomenal growth of this economic movement. Before doing so, however, let me state emphatically that these should not be construed as weakening the arguments for bird protection adduced by the United States Department of Agriculture. Such an interpretation would be entirely at variance with the truth as well as the object of this essay.

One of the most subtle delusions in our estimate of the good or evil done by a certain species is a tendency to cling to old-fashioned and often false views of the economy of those species upon which it subsists. Take, as an instance, the barn owl, whose wonderful record as a mouser has suddenly set him so high in the estimate of the up-to-date farmer and zoologist. What evidence have we that the commoner species of vole or meadow mouse (*Microtus pennsylvanicus*), which haunts our pastures in the Middle and New England States, and forms nine-tenths of the barn owl's food in that region, is, as universally supposed, an unmixed evil to agriculture? Of course the popular verdict is dead against the mouse in this instance. But it is a fact that not one per cent. of the study devoted to owl stomachs has yet been directed to the food habits of this mouse. In fact, no scientific investigation of the diet of the meadow mouse has yet been published. Its claim to a position in nature's economy, quite on a plane with many species which we now consider useful, or at least harmless to man's interests, is one which the economists would do well to consider.

Independently of diet, what have we discovered as to the benefits derived from the burrowing of mice and moles in the soil? Do not their myriad tunnels and runways have a place in the economy of tillage and drainage of far greater significance than we are yet aware? Among the undigested remains of meadow mice which the barn owl ejects from his crop we find about ten per cent. of other animal material, consisting largely of the skulls and hair of the short-tailed shrew (*Blarina brevicauda*), the common and the star-nose moles (*Scalops aquaticus* and *Condylura cristata*), the white-footed mouse *Peromyscus leucopus*), and the jumping mouse (*Zapus hudsonius*). All these, if given a chance, would enter a plea of "not guilty" before the bar of economic zoology.

The cases of the shrew and the moles are pretty sure to secure a favorable verdict, but even with these, as we shall see further on, the evidence on both sides is as yet too circumstantial for a final decision.

The jumping mouse, because of its scarcity, cuts so small a figure in the calculation that the economic count against him, even if it can be proved (and that is very doubtful), is fully offset by the æsthetic and scientific interest which it awakens in every lover and student of nature.

The white-footed mouse or "deer mouse" of our woodlands and clearings forms a small part of the food of many of our rapacious animals. It will, ere long perhaps, be made the subject of economic study, and it is safe to predict that such an omnivorous forager will set a good many investigators by the ears before his real status can be determined. From what I have seen of his habits, I doubt not the deer mouse, with many others of his ilk, will eventually line up with the American crow on the fence of economic controversy.

Now and then our king of mousers, the barn owl, sets foot on a house mouse or a rat, and we feel sure of the utility of such a step, but we must not forget that one or two per cent. of its food consists of birds. We naturally exclaim how glad we are it is so small, on the principle that bird-killing (by birds, of course) is the unpardonable sin. But even here our standards are often sadly inconsistent, as many of the birds devoured by rapacious animals are of far less apparent value to man than the devourers. The question is further complicated by the frequent instances where our hawks and owls prey upon each other. There are other interesting matters in the diet of a barn owl which must discount somewhat the exaggerated valuation of his services to agriculture, but for all that the economists have in him a trump card. Let us now turn to the mole question.

Until lately we have known very little of scientific fact about the diet of our common mole (*Scalops aquaticus*). Under the direction of the Pennsylvania State Board of Agriculture, an expert examination of about forty stomachs of the common mole shows that only one had intentionally devoured vegetable food, and that all had largely depended on earthworms, June bugs, click beetles and other "injurious" insects, earthworms forming the bulk of their diet.* There are more than two ways of judging these facts from the standpoint of economic zoology. Mr. Harry Wilson, the gentleman who conducted the inquiry, decides to his own satisfaction that any animal, if proved to be insectivorous, and not herbivorous or granivorous, is beneficial to the farmer. On these grounds he is content to rest his case, acquit the mole of wilful trespass, and commend him to the tender mercies of the husbandman. But the market gardener and the florist and the owner of a level lawn exclaim: "Not so; we will grant that he does not eat our seeds, vegetables, bulbs and grass roots, but he uproots and undermines them, and makes a thousand passageways in which noxious mice and shrews may forage and destroy."

One observer, Mr. E. H. Darlington, of West Chester, Pennsylvania, voices the opinion of another and a surprisingly small class. In answer to the questions: "Do you consider the mole injurious to growing crops? In what way?" tabulated in the bulletin referred to, he answers: "By the destruction of earthworms." Mr. Darlington is the only one of forty correspondents who suggests that the earthworm diet of the mole is an injury to crops. Probably a much smaller proportion of people than one in forty ever considered that phase of the question. We have become accustomed to watching the robins doing yeoman service above ground in this line, and unconsciously have got to thinking that the earthworm was made solely for dietary purposes. Darwin, however, has beautifully demonstrated† the hidden economy of the earthworm, and how its value as a converter of decay into food is only exceeded by its agency in tillage and the manufacture of arable soils.

In the light of this evidence, the fact, now fully recognized by zoologists, that the mole is not a vegetable feeder marks but one step in our investigations of its economic status. A second step in the right direction is the important discovery that it destroys a large number of insects. But the burden of proof, strictly speaking, yet rests upon the admirers of the mole. To these we would put three significant questions: (1) In its widest acceptation, is the mechanical action of moles on the soil more beneficial than injurious to vegetation? (2) Is the insect food of moles chiefly composed of species classed as injurious by recognized authorities? (3) Is the destruction of earthworms by moles an indirect injury to agriculture or a beneficial check to the excessive increase of the earthworm? The writer believes that the mole will eventually triumph in this controversy. The mole has been cleared of many unfair accusations of ignorant and short-sighted people, and no doubt can satisfy the anxious inquiries of would-be friends. We have good reason to predict that our humble and industrious *Scalops* is unwittingly pursuing a wise economy in its varied relations to soils, drainage, forestry, agriculture and animal life, maintaining that wonderful balance of nature which man, above all other creatures, has conspired to disturb.

As we take up, one by one, the instances of so-called "noxious" and "beneficial" animals, placing ourselves in that unselfish attitude to creation which seeks the greatest good for the greatest number, and as far as in us lies searching out with diviner insight the end from the beginning, how strong the conviction comes that the wisest verdicts of economic zoology may fall short of the truth, and are often fraught with disaster. The dire results of exterminating, in some cases by decree, in others by neglect, the so-called noxious animals and many of the insectivorous birds, in certain parts of Europe, is an object lesson for America. From the tyranny of the game-keeper and his titled master we may

* "The Economic Status of the Mole," Bulletin No. 31, Penna. Dept. of Agric., 1898.

† "The Formation of Vegetable Mould through the Action of Worms," Charles Darwin. New York, 1882.

hope to be spared, but the lawlessness of the lumberman, the poacher, the plumassier, the oologist and the small boy with a gun is an ever-present menace. Against these wasteful tendencies of a lusty young nation, revelling in the careless wealth of boundless possessions and of natural resources which once seemed inexhaustible, we rejoice to observe a growing protest. The Agassiz Association, the Audubon Society, the A. O. U. committee on the protection of birds, the changing game laws of our States, the forestry associations, the boards of public instruction, the natural history societies and writers of to-day, and above all the national and state departments of agriculture in their bureaux of economic zoology, are a mighty and providential power for the reversal of the brutal misconception of nature which grew apace with the young life of our nation. Fortunately we have called a halt before our losses were irretrievable. We are getting slow to believe what the prophets have told us, and are relying less on what may be termed the feudal instinct of self-preservation than on hard-pan facts of zoology. We are giving beast and bird and creeping thing the benefit of the doubt. We are telling the panic-stricken farmer to keep on going slow when he sees a snake in the grass, a crow in the cornfield, a hen hawk or an owl in the meadow, or a weasel in the woodpile. But we must go further, striving to teach not only the economy which adds to wealth, but that also which adds in a larger sense to the sum of human happiness. Who can calculate the benefits, mortal and immortal, which accrue from the mere presence of created things among us? The song of bird is not more cheering, more instructive, than hum of bee or low of kine to many a soul. Can we not recall the delight and surprise of a nearer acquaintance with some shy, outlawed creature of the woodlands, which prejudice or mistaken economy has put under the ban? In the serious problems of extermination and prevention which confront him, it is undoubtedly the province of the economist of the future to carefully weigh these considerations.

It is argued by some that nature contains within herself remedies for her own deliverance, and that when man unreasonably oversteps the bounds there is sure to be a healthy reaction. In other words, that we will learn the best economy by our mistakes, and the sooner the mistake is made, the better. As a result of precisely this happy-go-lucky policy some of the noblest and most useful native mammals of America are practically exterminated, our forested mountain lands have been transformed into a rocky, fire-swept wilderness, our water supply into an uncontrollable menace, and the useful songsters of our towns and villages are now evicted by a pert, voracious horde of English sparrows. The fast-and-loose economy which once permitted such abuses in America, we rejoice to say, has had its day; its results, alas, will outlive many generations.

SAMUEL N. RHOADS.

Some Animal Pets.—III.

SAN FRANCISCO, July 28.—You will find you have struck a very responsive chord in your suggestion that your contributors should write of their experiences in animal pets, and you will be obliged to set aside special space, for people who have owned domestic pets and like to talk about them. The theme is a pleasant one, and the proneness to recount instances of their intelligence is like unto that of the young father of the first boy to entertain his bachelor friends with the smart sayings and doings of the wonderful child. My friends have been spared this infliction for the best of reasons, but I confess my equivalent weakness for almost anything in the way of animals, and in studying their habits and peculiarities, and "that reminds me" that some day I will tell you the story of my first and only appearance on the race track as an amateur jockey; but as Kipling says, that is another story that may come later.

When I was living in Texas, a Mexican brought me one day a little Mexican leopard cub or kitten, about four weeks old, that he had caught. It was about the size of a half-grown cat, with soft, spotted fur. At first it refused all sustenance, but by perseverance I at last persuaded it to take milk, and it thrived wonderfully, and became very tame, and would play with a ball or spool for hours, the same as a kitten. It would crawl up into my lap and take its nap, at night sleeping on my bed. It grew rapidly, and in a few months attained its full size, and was allowed to roam about the house. It showed great aversion to strange dogs, but was sociable with my old pointer, who tolerated it as simply one of the family, though not displaying any great partiality for it. However, there were no ruptures between them, but if any strange dog came about "Jimmy," as I called him, would make it warm for him.

As Jimmy grew older he became stouter and heavier, and at night would claim more than his share of the bed, and would lie across me until, his weight becoming oppressive, I would roll him off on to the floor. I tried to make him sleep on the rug alongside of the bed, but he would crawl upon the bed again during the night. One night, after pushing him off repeatedly, I gave him a good cuffing, whereupon he growled and showed fight. I got my riding whip and punished him severely. He crawled under the bed and sulked. I determined to conquer him, and hauled him out and made him lie on the rug, though very unwillingly. In the fracas he scratched me severely. From that moment there seemed to be a suspension of cordial relations. He gradually became sulky and cross, and began to show the natural characteristics of his nature, and seemed only awaiting a good excuse to test the question of supremacy. It was evident that he was rapidly asserting himself, and that it would be dangerous to attempt any further punishment. He had always taken his meals from the same dish with the dog, but now would snarl and show his teeth if Ponto came near where he was eating. He still had the run of the house, and dragged the rug off into a corner to sleep on, and never essayed to get on the bed again.

He was now about two years old and a beautiful animal, but it became apparent that he was rapidly resuming his natural characteristics, and it would be only a question of time when he would be a dangerous companion, and serious consequences might come from the association, so I determined to dispense with his society. An opportunity occurred soon after. A traveling showman offered me $100 for him, which I accepted; and we parted without any manifestations of regret on either side. It was only another illustration of my theory that it is universally the case that all animals redeemed from a wild state develop their natural characteristics as they grow older. How long this one might have retained his amiability had not our little difference of opinion occurred, I cannot say; possibly months, but it was bound to come sooner or later, and probably not much later. The treacherous nature of the cat family was sure to crop out eventually.

I am not dead sure that even in mankind there is not a suspicion of this similar disposition to become disagreeable as we grow older, for who of us have not a little experience with old aunts and uncles who get crabbed and cross as they run to years. We are unfortunately limited in our disposition of them. We can't set the dog on them, nor sell them for $100 as curiosities, the prejudices of polite society in these days not permitting such methods, more is the pity.

PODGERS.

About Bears.

I HAVE been much interested in all of Mr. Mather's articles, as he evidently tells what he has seen and knows. In his last he speaks of wishing he had been able to see how bears pick raspberries and catch ants. Although I have been nearly as unfortunate as he in my experience with bears, I can tell him how these two things are done.

I used to have a dear friend, Mr. Henry Clapp, of Brownville, Me., who in many respects was like Mr. Mather's friend, Port Tyler. Once when I visited his place to get him to take a woods cruise with me he had two young bears, which he had taken in the spring, and whose actions he had been carefully studying. He told me that he had often led them to the woods and watched them obtain various kinds of food. He said that in picking raspberries they stood up and drew the bushes toward them with their paws, but picked the berries with their mouths. A hunter of my acquaintance told me of seeing one pick blackberries in the same way. I once, in coming around a turn in a narrow stream in a canoe, came suddenly upon a bear engaged in picking a black, shiny berry, commonly known as bear berries. The bear did not wait for me to take any observations, but it was plainly to be seen that the bushes, which reached over the water, he had drawn with his paws. I have often seen where they have been gathering beech nuts before they fell; they would draw one fork of a limb toward them and split it off, and then reach out and draw in the other fork, often breaking limbs 2in. or more through.

Mr. Clapp told me that his bears showed a great deal of judgment in catching ants. They did not tear a stump or log to pieces at random, but on finding a log which looked likely they would strike it hard with a paw, and lay an ear close to the side. If there were no ants there they left it, but if they could hear the ants running along their passageways they would at once tear the log in pieces and quickly run their tongues along the grooves and catch many of the ants before they had time to scatter. He said that they were extremely quick in their movements while any ants were in sight.

I had the pleasure of seeing these bears eat their first green corn. They had never seen corn before, and when a husked ear was given one he turned it over and over, and looked curiously at it, very much as a coon will look at a strange thing. Then he held it with one paw and scratched it lengthwise with the other. On seeing the milk start (for the corn had not hardened) he carefully lapped it, and as soon as he got the taste of it ate it, very much as a pig would have done. I saw one eat freshly cut oats. He held a bunch with one paw and let the heads drop between the spread claws of the other paw, as a person would between his fingers, and then shutting the claws stripped the heads off and conveyed them to his mouth.

Mr. Clapp told me of often seeing them do a thing which I have never known any one to see done by a wild bear, but which they undoubtedly are in the habit of doing, or else these would not have done it. They would climb a tree which had a limb running out at right angles and walk out on the limb, then would lower themselves down by their forepaws and bite hold of the limb and swing back and forth, holding by their teeth. Then they would catch with their paws and draw themselves up. They would repeat this performance a great many times.

There is a mistaken idea that a bear cannot climb a small tree. Mr. Clapp had a cedar pole some 15 or 16ft. high and not over 6in. in diameter at the butt set upright in the ground, and both of these would climb it as easily and quickly as cats.

They refused fish when fresh, but ate them greedily as soon as they began to grow tainted.

In regard to eating honey, I think that our Maine bears seldom get any except from domestic hives, which they frequently plunder in the night, and what they get from bumble bees. Jock Darling once shot a bear in July, which, as he told me, had strawberries and bumblebee honey in his stomach. A friend who was bee hunting told me of finding a bee tree which showed where bears had tried to gnaw in it several different times, but the wood was so thick that they had been unable to get at the honey. I have seen where they have torn stumps in pieces to get at nests of wasps, but probably all they obtained was the grubs.

There are many things which bears do which I, like Col. Mather, should like to see them do, but I fear that my wishes will never be gratified. M. HARDY.

BREWER, Me.

Nature's Compass Signs.

CLARKSDALE, Miss.—*Editor Forest and Stream:* I have read Mr. Dearborn's notes on woodcraft and some dissenting comments upon them. In the lowest grounds of the Mississippi bottoms, where little or no undergrowth grows and the woods are called "open swamp," the phenomenon of moss on the northern sides of trees, with clean bark on the southern side, is quite marked. The rule is not invariable, but the preponderance of trees coming under it is quite decided. The woodman, casting his eyes to the northward, will see light colored tree trunks, as characteristic of that view, and per contra, will see dark color looking southward.

In drizzly weather he will also note that the north sides of the trees are damp, while the south sides are dry.

There is great sameness in the topographical features of large areas of these flat swamps, and I have occasionally availed myself of the "moss sign" to direct my course.

On the higher grounds, where canebrakes or thick underbrush prevail, I have found it difficult to detect any marked difference in the growth of moss on the different sides of the tree trunks. As to the other distinctive features mentioned by Mr. Dearborn, as presented by the north and south sides of trees, I am inclined to regard them as fanciful or theoretic only.

COAHOMA.

Game Bag and Gun.

The "Brief's" Pictures.

THE illustrations in the current edition of Game Laws in Brief, Mr. Charles Hallock says, well represent America's wilderness sports. The Brief gives all the laws of the United States and Canada for the practical guidance of anglers and shooters. As an authority, it has a long record of unassailed and unassailable accuracy. Forest and Stream Pub. Co. sends it postpaid for 25 cents, or your dealer will supply you.

The Vermont League.

[Read before the American Fisheries Society by John W. Titcomb.]

NATURE liberally provided the waters of the world with food for man, and has been lavish in allowances for waste both from natural and artificial causes and the improvidence of man. With the progress of civilization, the increase of population and the change in natural conditions caused thereby, with the consequent increased demand for fish food, the lavishness of nature is set at naught. It will be conceded that the fish in the waters are intended for the use of man. Their protection, then, is simply a safeguard to prevent the supply from being exhausted, and to make the production, whether artificial or natural, as useful to man as possible.

It will be conceded by all members of this society that the artificial propagation of fishes has passed beyond the experimental stages, and that it is political economy for States to engage in fishculture. It will also be conceded that nearly all fish must be protected at certain seasons of the year, and that immature fish must be protected at all seasons if they are expected to reproduce their kind and nature is to assist in the work of the hatcheries. How many of our State legislatures are convinced as to the desirability of propagating and protecting fish to the extent that wise laws prevail which are not subject to radical changes or repeal at each recurring legislative session? Nearly, if not all, the States have some kind of protective laws; some wisely drafted, and more that have no reason for existence. Protective laws, so called, often defeat the very object for which they are enacted. It is a common custom for legislators who want more liberal laws, which, for example, provide for the use of nets in waters where nets should be excluded, to draft a bill reading somewhat as follows: "An act for the protection of fish in Lake ——," and then follows a bill providing for the extermination of fish in said lake.

In listening to many valuable papers read during the National Fisheries Congress at Tampa last January, of interest to both sportsmen and commercial fishermen, I was impressed by the fact that almost every paper, scientific or otherwise, alluded to the question of legislation and the condition of public sentiment. If the paper did not allude to legislation, the discussion which followed its reading would do so. Examine the laws of any State and many will be found which are practically void. I do not refer to fish laws in particular, although this class of legislation will be found in the above category quite as frequently as any other. Two reasons will be found for the lack of observance of void legislation. First, the laws may not be wise ones and have no good reason for existing. Second, public sentiment is opposed to the laws, either because they are unwise or because the people are ignorant of the real reasons for their enactment. This public sentiment may or may not extend throughout the State, and it may be limited to one town or one county in the State. If public sentiment throughout the State is opposed to the observance of a law, its enforcement is practically void. If one town or county is opposed to the law, it is for purely local, selfish and short-sighted motives, but it tends to make the law ineffective if its enforcement is left to local officers. It frequently occurs that the small section of a State in which the law is unpopular can send a strong enough representation to the Legislature to obtain its repeal against the best interests of the State at large. All such work injures or weakens the efficiency and popularity of protective laws in general. The average legislators becomes disgusted with the frequent introduction of bills for the propagation and protection of fish, and pays little attention to them unless such bills are called to his attention as directly affecting the interests of his constituents. He often goes to the capital with certain objects in view and interests himself in executing those objects by the passage of certain bills regardless of other interests. I do not intimate that he is dishonest, but his energy is exerted in the interest of his own constituents. He has not time to investigate proposed legislation on the fisheries, for instance.

If, then, the Legislature does not believe in the propagation and protection of fish, an organized effort must be made to educate legislators as to the value of such work. The political economy of such legislation must be demonstrated, and an appeal made to their pockets. This work should begin by educating the entire people of the State. The education of the people and the shaping of good legislation go hand in hand. The representative of a community is usually chosen because he has been successful in the management of private interests. If he sees that his constituents are interested in certain legislation, he will interest himself sufficiently to act intelligently upon it. I have attempted to show the necessity of organization to promote the objects of this society. I will now describe an organization which has been doing successful work for nearly eight years. It has been said that fish and game protective societies seldom live more than two or three years. Such is too often true, but if they are managed upon a strictly business basis their period of usefulness will continue as long as the objects and aims need fostering.

At the risk of appearing egotistical because I was one of its promoters, I will describe the Vermont Fish and Game League, how it was organized and what it has accomplished. While its work is confined to a State with commercial interests of comparatively small importance, the same kind of an organization can be effected suited to the needs in other States. Some States already have similar organizations.

Methods of Organization.—The first steps taken were as follows: A circular letter was sent to every postmaster in the State, asking him to name all the citizens in his town who would be interested in a State organization for the protection of fish and game. A reply card was inserted. An alphabetical index of all names received in reply to this circular was booked, and a second circular was sent to all whose names were thus booked, inviting them to pledge themselves to join a proposed League with the above-named objects, to agree to pay a certain fee (in this case $5) when 100 names had thus been pledged, and with the understanding that no articles of incorporation would be procured or organization effected until the 100 names were pledged. The same circular requested each recipient to send in names of eligible members. Frequently the same names were sent in by several sportsmen in one community, showing the desirability of keeping an alphabetical index of all eligibles to avoid repetition in sending out circulars and to have as complete a record of eligibles throughout the State as possible. In response to the second circular 111 names were pledged, and articles of incorporation immediately procured, and organization was effected. A meeting of charter members was called, a constitution and by-laws (previously prepared) were adopted, and officers were elected. Of the 111 charter members, all but one redeemed his pledge by paying into the treasury $5. From the date of organization, in 1890, to the present time the membership has constantly increased, until the present membership is 563. After the first year the membership fee was reduced from $5 to $3, and the annual dues from $3 to $2. Town and county protective associations were admitted as branch clubs, and permitted to send one delegate as a voter in all business meetings. Regular meetings are held annually, and special meetings from once to twice per year. At the annual meeting a dinner is given after the business is transacted, followed by post-prandial exercises. The last three years a so-called midsummer meeting has been held on an island in Lake Champlain. At these meetings many notable men are gathered. On the occasion of the last meeting President McKinley was present as a guest. Politics are not allowed to enter into the work of the League or to be discussed in the meetings, nor to enter into the post-prandial exercises.

The subjects in which the League is interested are kept constantly before the people by means of cloth posters giving a synopsis of the laws, pamphlets containing the chapter of game laws in full, by frequent circular letters to the members scattered throughout the State, and by the voluntary aid of all the newspapers published in the State.

The people must know the reasons for the fish and game laws, and that they are not designed for the especial benefit of the fishermen, but for all the people. There would be no protective law, no close season on fish and game, without a good reason for it. When the people are convinced that as a matter of political economy fish and game must be protected, they should understand that the laws are framed with especial reference to the habits of each species thus protected. Take by way of illustration the statutory limit on fish which can be legally caught—the 6in. law on trout, for example. All the people should know that trout will not reproduce in our streams until they have arrived at an age when they will have attained a growth of 6in. or more. They would then understand that, if allowed to be caught before they are 6in. long, reproduction ceases, and, with the excessive fishing now prevalent, all trout will be killed before arriving at the stage of reproduction, and total extermination follows. Artificial propagation and stocking cannot replenish the waste. The same applies to the statutory limit on salmon, lobsters, etc. The statutory limit for each species to be legally caught should be one which will permit natural reproduction at least once before capture, or there is little argument for the law.

When the League was organized eight years ago public sentiment was at a low ebb so far as fish and game interests were concerned. With its inception an appropriation for a State hatchery was secured, and liberal appropriations for its maintenance and extension have followed. Through the interest awakened by the League a national hatchery was located in Vermont. The game laws, which were in a wretched condition, were codified and revised by a committee from members of the League, presented to the Legislature in the form of a bill which at the same time repealed all existing legislation of the same nature, and became a law almost without a dissenting vote. Our legislators are beginning to consider fish a matter of political economy that these interests should be fostered, and the League loses no opportunity to present to the public and to the sceptic the arguments which will appeal to their pockets.

I would not have you think that our laws are perfect, or that what has been accomplished was attained without hard work on the part of the administrative force of the League. We have asked of our Legislature what we thought we could obtain. As public sentiment increases, more desirable legislation will be asked for.

The poacher, like the poor, is always with us. He is only kept in check by rigid enforcement of the law whenever opportunity offers. When necessary, we do not hesitate to send to the city for a good detective and pay the costs out of the League treasury. In Vermont the League is the strong right arm of the Fish and Game Commission.

If any one is led by the arguments in this paper to organize a similar society, let him consider well two important features. The work connected with its promotion and future success is tremendous. No salaried officers exist, although in a State of such important fishery interests as, for example, Florida or Louisiana, there should be enough of support to pay the salary of a stenographer.

Work of this nature, once successfully undertaken by one or two actively interested persons, cannot be dropped by them after the organization has been put into working condition. One man does the most of the work. He should be familiar with the fisheries of his State and not be prejudiced in favor of either sportsmen or commercial fishermen.

We believe in the social side of the organization as contributing largely to its success, but our membership is too scattered to meet socially more than twice a year.

My First Chicken Shoot.

Editor Forest and Stream:

I was much interested in reading Mr. Hough's notes on chicken shooting in your issue of Aug. 13, and they brought vividly to mind my first chicken shoot, which was thirty-two years ago this August while I was visiting friends in Milwaukee, Wis. The opening day for chicken shooting was the 15th, a few days after my arrival, and I was invited to be one of a party of five. The only names of the parties that I can now recall are of the late Rev. C. D. Helmer and a Mr. Matson, a prominet jeweler.

We took the evening train of Aug. 14 for some small place west of Watertown, Jefferson county, Wis. I remember that it was about as far beyond as Theresa, my old home, is from Watertown, Jefferson county, N. Y., after which the Wisconsin county and town were named. A Jefferson county, N. Y., man turned this name to good advantage during the fifties by starting a wildcat bank, the bills of which were a facsimile of the Jefferson County Bank, of Watertown, N. Y., excepting the "State of Wisconsin," which was so small as not to be noticed; these were sent East and put in circulation, and for some time passed readily for the New York money, until the crash of '57. But this is not chicken shooting. I think we had got as far as the small town where we stopped over night, and the next morning took conveyances five miles north, where we were met by two men with two pointer dogs only eight months old. Here the party divided, three with one dog, four with the other, myself with the latter.

The first field was a wild grass meadow, with a small stream running through it. We had not gone far when the dog came to a point, and the four shooters closed up around him. No bird flushed, and we thought the dog had made a false point; but when told to "hie on" he did so and caught the chicken. He did the same thing twice afterward during the day. They were well-grown birds, but had never been hunted and did not propose to leave their native heath. Sometimes three or four birds would get up at a time, and all four guns would crack, and part of the birds would drop; but it was impossible to tell which gun had secured them. Again only one bird would get up, and as all would shoot no one could claim it. At noon we went to a farmhouse, where some of the birds had been taken for dinner, and such a chicken potpie as we had I had never eaten. Helmer asked, "Well, Davison, how many chickens did you shoot?" I answered, "Not any." "Can't you shoot chickens?" he asked. I told him that where there were four shooters over one dog and all shot at the same bird I did not claim any. I do not remember how many birds were taken during the day; the party of four returned to Milwaukee that evening, while I took the train west to Sun Prairie, where I stopped over night, and the next morning tried to combine business with pleasure by buying a lot of 20,000lbs. of wool, but the owners and I could not get together by a cent and a half per pound, and the deal did not come off.

A friend drove me to Madison before noon, where I met a German groceryman whom I had known in Little Falls, N. Y., in 1885. Almost the first question he asked was, "Do you want to go shoot chickens?" I told him that was just what I wanted. I had dinner with him, and he hitched up his horse to his grocery wagon and we drove about ten miles back toward Sun Prairie. Here we put the horse under a stone fence, and had not gone more than fifty rods when the dog came to a stand. A chicken got up, which Oppel shot; another which I got; then another for Oppel; another for me, by which time Oppel had reloaded, when the fifth bird got up only to go down before his 20-gauge gun. In an hour we had so many birds that his bag (I had no bag) was getting too heavy to carry, and we left them beside the stone fence and then started out again. While going through a wheat stubble a single bird got up and flew straight away from us; I was behind Oppel, when he shot both barrels and missed. I had stepped to his side and raised my gun, when he shouted, "Don't shoot—too far." But it came too late; I shot and the bird dropped. He said it was the biggest shot he had ever seen on a chicken, and I have always been proud of that shot. Well, all good times must have an end. We stopped shooting when it began to grow dark, and when we got to where we had left the other birds we found we had twenty-two chickens. Oppel declared that I had shot as many as he. It was nearly 9 o'clock when we reached Madison, and thus ended my first and also my last chicken shoot.

J. L. Davison.

Lockport, N. Y.

Reminiscences of an Old Sportsman.—XV.

One incident of this day we greatly enjoyed and have often laughed over since. We were crossing some open ground, when we came to a cornfield through which we were passing, when we were met by the owner, who anxiously inquired if we were hunting snipe—this name was quite often given the woodcock in those days. When we told him that we were in pursuit of them, his face lighted up and as he pointed to quite an area of the field that had been devastated by crows, he exclaimed: "Drat the snipe, they have eaten more than ten bushel of corn, and I hope you will just clean 'em out." Then pointing to the bit of stony ground covered with thorns and briers that I have previously described, he told us that the birds lived there through the day, and came at night and feasted on his corn. He then offered to go and show us where they were, and we started for the place, the old man anathematizing the birds at nearly every step. When we came to the cover the dog pointed just at the edge near a large thorn, and when I went around the bush the bird rose and Eaton dropped it. No sooner did the old man see it fall than he started for it, shouting: "Give it to him; that's one of the condemned varmin; give it to him." The bird was only winged and made an effort to escape, but Nemesis was after him, a big boot swung back, and then launched itself at the luckless bird with a swish and vim that would not be denied, and the next instant every bone in its body was smashed and the battered remains went sailing through the air, while the old man fairly danced in ecstacy as he exclaimed: "Take that, you condemned thief. Steal my corn, will you?"

Eaton very nearly had a fit, and I was not much behind him, and it was some time before we recovered; in fact, we never did get over it, for the mirth-provoking incident still works its spell, and I can still—through the mist and haze of more than four decades—see the expressive working of the old fellow's countenance as he dances in glee at the death of the long-billed thief that had stolen his corn. This is the only time that I have heard so serious a charge preferred against the gentle woodcock, although farmers have often come to me with a request that I would shoot the doves, grouse or quail that were eating their corn. I was ever very sensitive to the cry of distress, and am pleased to say that in every instance I did my best to rid my farmer friends of the destroyers of their peace. Not that the crows did not suffer at my hands all the same whenever they came near enough, for I have long had a deep-seated antipathy to the sleek-looking rascals, and seldom lose an opportunity to thin their ranks. When a boy, I was shooting them in a neighbor's cornfield, where one old campaigner seemed to take delight in fooling me, until I became quite interested, and I determined to have her at all events; but it was of no use, I could not get near her. Finally I followed in the direction she usually went, into a grove of pines, hoping to find her nest. After a short search I discovered it full of nearly grown young ones, so I took a position within easy shot and waited for her. When she came I saw that she had something in her bill, and as I cut loose and brought her down I found that she had a young ruffed grouse. Now these birds have always been especial favorites of mine, and as I gazed upon the poor little murdered fledgeling I made a solemn promise to myself that this foul crime should be avenged, and this is why my gun swings into position and my finger presses the trigger whenever one of the sleek-coated marauders comes within range. But I am wandering from the Willington covers.

The third day we took leave of our friend Dolly and his good wife, and drove north nearly to the Stafford line, when we turned west and crossed the river into the town of Ellington; then, after exploring some good looking covers we turned south and drove nearly the length of the town of Tolland, finding a number of capital woodcock covers as well as grouse resorts. Night found us within a few miles of the hotel, and turning in the proper direction we were soon there, and found that our stopping place was the jail as well as the tavern. We thought this rather a queer combination, but as the landlord appeared to be the right sort we paid no further attention to the matter until about midnight, when I was awakened from a sound sleep by the tramp of feet passing my door, and a buzz of something that was going on, so I arose and went to the door to learn what was up. It appeared that one of the prisoners—a horse thief, if I rightly remember—had escaped, and the racket that had disturbed me was caused by the muster of all hands to go in pursuit, and I soon heard the different parties leaving and the whir of the wheels as our landlord—who was also the sheriff—took his departure, and soon all was quiet and I again closed my eyes. We had been informed in the evening that there was an abundance of quail in the vicinity, so at daybreak I dressed myself and went down for the purpose of going outdoors to see—or rather hear—if the report was true, for quail can nearly always be heard and located at this hour while giving their morning call. When I entered the sitting room I found two of the men, who had just returned from searching for the runaway, hovering over a blazing fire, and learned that the morning was decidedly frosty and that there was little chance to recapture the convict; for the country had been well searched, and not the slightest trace of him could be found. As I drew the bolt and opened the back door, the runaway prisoner stood before me shivering in the frosty air, and as I bade him a cordial good morning he ducked his head in acknowledgment, then with a sheepish look he said that he had come back, almost frozen; and he shambled into the house. Just as he was passing me I was seized with an inspiration, and in response to the call I grabbed him by the collar and yanked him into the sitting room, and with the most important air that I could assume I handed him over to the fragment of the *posse comitatus* seated by the fire. You should have seen them when, with a tightened grip on his collar, I shoved my captive toward them. With wide open eyes they both jumped as one man, and grabbing each an arm and a firm hold of his collar, they hustled the shivering wretch away to the strong room. The next season I again

visited the place, and as I sat by the fire in the evening I was greatly amused to overhear a man say to his companion: "No, he don't look it, but they say he found the thief stealing his horse, when he grabbed him and brought him into the house by main strength, and gave him up to the officers." In after years I found that I was known to about every one in the vicinity as the boy who captured the thief single-handed. Now I had done this just to see how the two men would act, with no thought as to ulterior results, but like many another who has unthinkingly performed some act that he thought of little importance and awakened to find himself famous, I found myself a hero, and the more my innate modesty prompted me to disclaim any merit for the performance, the more did my admirers appear to think me deserving; in fact, this greatness was thrust upon me, for I do not believe that I was a born thief-taker and most certainly I had achieved nothing of the kind, so I just wore my honors meekly and received the adulation of my admirers with my accustomed modesty.

There was one resultant feature of this episode that afforded me abundant pleasure and satisfaction: every farmer in the whole region appeared to be pleased to have me shoot over his grounds, and many a sweet spot for birds did my good friends point out to me during the years that I frequented the dear old town. While there were no extensive covers that were well stocked throughout, there were little runs where grouse loved to stay, and many nooks and corners in the extensive alder covers where woodcock could nearly always be found in proper season, while quail were fairly abundant all through this section.

For several years the grounds in both Ellington and Tolland, together with those of Willington, were known to our set as the Willington grounds, but after the old chaparral and some of the other noted places near it were discovered and laid waste by the market shooters we sorrowfully abandoned those covers, and for a few years this section of country was known to us as the Tolland grounds, although many of our best covers were in the adjoining towns of Ellington, Coventry and Mansfield, for we had thoroughly explored a vast amount of good looking country in this section, and discovered quite a number of "favorite covers," so many, in fact, that we could not visit nearly all of them during the three or four days usually allotted to a visit to this section, but within a few years after we had been crowded out of the Willington grounds the town of Tolland became too densely populated with shooters to suit us, and, much to our regret, we were obliged to abandon many of the dearly loved covers that we had worked so hard to find and that had afforded us so many happy days of royal sport. Of course we did not begrudge any one the pleasure of shooting over our premises, but we did blame some of them for the persistent manner in which they haunted a favorite cover until not a feather remained, for utter desolation will surely follow when this course is pursued for a season or two. Take, for instance, the old chaparral. In all the years that our set shot there, two to four visits were all that were made in any season, and upon every occasion, year after year, birds were found there in abundance; but after two seasons, during which the market shooters shot it out nearly every day, scarcely a bird could be found within its borders, and it has remained barren ground to the present time. But the little patch previously described as the home of the corn stealers has not been found by these destroyers, and among its rocks and brambles a goodly number of birds may yet be found, at least this has been the case up to a few years ago, since when I have not visited the place.

SHADOW.

[TO BE CONTINUED.]

Mongolian Pheasants in Virginia.

LEXINGTON, Va., Aug. 1.—*Editor Forest and Stream:* Complying with your request, I write you of my experience in introducing the Mongolian pheasant into Rockbridge county, Va. In March, 1897, I secured two pair of young birds, through my friend, Col. Jno. D. Letcher, who was at that time located at Eugene, Oregon. The box or coop, in which they were shipped, was about 20in. square, the sides and ends were of woven wire which was covered with gunny sack, and a tin trough was fastened in one end. The birds were thirteen days en route, but were strong and healthy when received.

They were placed, a pair each, on two secluded farms in a bend of North River, in woven wire coops 8×20×3ft., with a small house at one end to afford shelter and seclusion. One pair was located some distance from the farm buildings in a grove, and no one was allowed to approach them except a little girl, who attended to feeding and watering them. This pair became reconciled to their situation in a few weeks, and occasionally an egg would be found in the coop. The irregularity in finding the eggs excited some interest and closer observation, when it was discovered that snakes were feeding on the eggs. After a number of snakes had been killed in close proximity to the coop, the eggs were gathered with more regularity. We saved one setting of eggs, and in the absence of something better placed them under an ordinary barnyard hen. My information is that the pheasant here will not sit in captivity. Only two of these eggs were hatched, and the young birds were trampled upon and killed by the hen.

The other pair was placed nearer the house, in a more public place, and they were, if possible, wilder at the end of three months than when first received. They were then removed, their coop being placed beside the other pair. Instead of enjoying each other's company, as was supposed would be the case, the male birds quarreled incessantly, and neither pair did any good. Since then I have heard that the males are desperate fighters, that when two or more are confined together there will soon be but one left. In November one of the hens escaped; after unsuccessful efforts to trap her, six weeks later her mate was turned loose, and nothing further was heard from them until May, 1898, when they were seen together.

In May of this year the hen in captivity built a nest and began to lay. The first thirteen eggs gathered were set under a bantam hen, and there were hatched out nine birds; one died, and the other eight are now as large as full-grown partridges, and perfectly healthy.

It was very difficult at first to find something the young birds would eat; flies constituted their article of diet the first two weeks; then they would take cooked eggs; this was followed later by grits, bread, etc., and now they will eat anything other fowls will. I shall turn out several pairs as soon as they are fully grown, the others I shall keep in captivity, so as to be better able to distribute them.

The young birds were gentle when first hatched, but are growing wilder; the old birds are the wildest I have ever seen. They are about the size of our native pheasant, but are a much prettier bird.

F. W. HOUSTON.

Buffalo in Colorado.

DENVER, Colo., Aug. 5.—*Editor Forest and Stream:* I send you a little buffalo information, which may interest if it is second hand. If the number reported is true, it probably entitles Colorado to the credit of having the largest band of buffalo in the United States. If the "62" were "cows and calves," it also follows that there were bulls not far away in one or more small bands; probably altogether from fifteen to thirty of them.

A cow belonging to the Lost Park herd was killed recently, and our game warden has two "prominent citizens" of Leadville under $500 bonds each to stand trial for the offense.

We have a splendid buffalo bull in our city park here.

WM. N. BYERS.

The Republican of Aug. 2 says: Some of the early inhabitants of the northwestern part of the State have returned to view their former hunting grounds. Henry Schaffnitt, a reliable citizen living at Steamboat Springs, has written to the game warden stating that a herd of sixty-two buffalo cows have been discovered grazing within thirty-five miles of Steamboat Springs. Game Commissioner Swan cannot account for the appearance of the herd, as it was not seen previous to the present time, and buffalo are becoming so scarce that an actual count of the number in the country is possible.

The reports of the discovery of a large herd of buffalo near Steamboat Springs in the northwestern part of the State, whose appearance cannot be accounted for, have made interesting reading for old residents of Colorado, who remember when great herds of these animals roamed the State. W. N. Byers, who has followed the history of the few remaining herds of the State, says positively that the buffalo discovered are Colorado animals, and that he has known of them for the past thirty years.

Besides the herd near Steamboat Springs, there is only one other herd of wild buffalo in the State, and that is the Lost Park herd. Mr. Byers has known of and followed the history of this herd for the past thirty-nine years. He is very much interested in the remaining buffalo in the State, and urges strongly that the State Government give them the best possible protection from hunters. In speaking of the buffalo near Steamboat Springs, Mr. Byers said:

"I can give you positive information regarding those buffalo, which will show you that they did not come from any other section of the country than that which they are now in. These buffalo are the remnant of a herd that ranged in Middle Park as long ago as thirty-five years, to my knowledge. At that time they frequented the open part of the Park and occasionally one or more of them were killed by white men or Indians.

"About 1865 or 1866 they were ranging about the mouth of the Troublesome River, ten miles below Hot Sulphur Springs. At that time settlers were gradually moving into the Park and their advent drove the buffalo back into the hills, and toward the western rim of the Park. The winter of 1875 was an exceedingly severe one in the Park, and large quantities of snow fell, covering the country to a great depth. The buffalo were at that time on the headwaters of the Muddy River, which Fremont called the Milk River, about thirty miles north of Grand River.

"In the latter part of this winter, when the snow was still very deep, the herd was discovered by a band of Ute Indians. The Indians attacked them in the deep snow and killed nearly the entire herd, a few only escaping into the underbrush, and in this way avoiding slaughter. In the spring of 1876 three or four men who had settled at Hot Sulphur Springs went up to where the buffalo had been killed and brought back several loads of tallow from the carcasses of the dead animals. The men reported that the Indians had apparently surrounded the buffalo in the deep snow and had killed seventy or eighty on three or four acres of ground. The men thought that only a few of the herd had escaped.

"The buffalo were next seen on the headwaters of the Troublesome, fifteen or twenty miles from the place of the slaughter by the Indians. The Porter brothers, who had been buffalo hunters on the plains until the buffalo were exterminated, went into Middle Park, and turned their attention to killing game for the market. This was in 1877 or 1878. They found the little band of buffalo on the Troublesome, and killed four or five of them. They brought the meat to Hot Sulphur Springs and attempted to sell it. Information was filed against them for killing the buffalo, and a constable was sent to their camp to arrest them. They resisted arrest and drove the constable away at the point of their revolvers. Soon after this they left the country, apparently from fear of prosecution under the game laws of the State, in the district court, which was to convene thereafter at Hot Sulphur Springs.

"After the episode with the Porter brothers the buffalo continued to range on the headwaters of the Troublesome, and some of them crossed the mountain range into North Park. Some of these were seen on the North Park slope by Judge Spicer in the summer of 1883. He went up to capture some elk calves, and while there saw about ten buffalo, but supposed that there were more in the neighborhood.

"Soon after that prospectors invaded that section of the country in considerable numbers, and their presence drove the buffalo west along the crest of the main range to the neighborhood of where these buffalo are reported to have been seen a few days ago. The last definite report that I have had of the herd was from a young man who was hunting there four years ago this coming fall. He reported having seen, I think, ten buffalo, and he also thought that there were others in the vicinity. That is the last definite report that I have had of them, but I have been given to understand that they are still in the same section of the country.

"It is very gratifying, if true, to learn that the herd has increased to sixty-two, and if it continues to be protected it is probable that it will continue to increase. It is not natural for small, isolated herds to grow much in numbers, the tendency being usually the other way. People who have had knowledge of this herd have not been inclined to publish the fact, but since the announcement has been made by the newspapers I am willing to give this brief history of one of the two small buffalo herds roaming in a wild state in Colorado. They are being closely watched, and if any one is found hunting them, or reported to have done so, they will be prosecuted and punished to the full extent of the law."

CHICAGO AND THE WEST.

Illinois Prairie Chickens.

CHICAGO, Ill., Aug. 13.—Last week I had occasion to write something about the early and illegal shooting of prairie chickens in this and other Western States. It is still the same story. Each week brings out more indications that the sooner is at work and will continue at work, so that by the opening of the season we shall have once more the same story of broken coveys and wild birds. By this no reproach is cast upon the wardens, for they have a colossal task before them, and deserve credit for the bare fact that we have any chickens at all left in the West.

I refer more especially just now to the State of Illinois, which is notoriously bad this year, and very much worse than ordinary, for reasons already set forth in the matter of a (pretended) confusion of chicken dates. I get word this week that around Kewanee birds have been shot in considerable numbers, more than thirty days ahead of the law. At Kankakee, only about fifty-five miles south of Chicago, a restaurant is suspected of serving the illegal game as a regular thing, though this is not yet proved. At Rochelle, last Saturday, Deputy Hizer arrested John Oleson and Gus Williamson for shooting prairie chickens. Trial continued. At Quincy it is stated that the disregard for the law was "never so great as it is this year." Judge Ramsey, of Whiteside county, has done one of our noblest game birds more damage which a thousand Judge Ramseys can never repair.

Passing of the Chicken in the Nations.

Every shooter of the West knows what a paradise for small game the Indian Nations once were, and can recall the stories of the enormous bags once made by any shooter who cared to make them in that prolific land. It seemed indeed that the chickens "never could be shot out." It was the common story that there would "always be chickens away down in there, it was so far away." Perhaps there are some shooters who think the old abundance is still in that region, and that on some lucky day they may be able to get a trip down there and have a "real good old chicken hunt" where the "birds have not been shot out." To all such I would refer the clipping from the Denison, Texas, Gazetteer, which I append. Denison is near the northern end of Texas and not so very far from what was once a grand game country in the Nations. The writer of the article in the Gazetteer does not seem to be a crank or a particular rabid sportsman, but makes the statements in a cool and matter of fact way, as a piece of news. It will be unwelcome news to those who have not already learned it.

"A few years ago," says the paper, "prairie chickens were plentiful within a day's drive of Denison, but that time is past. With the rapid settlement of the country the birds have disappeared. The best chicken shooting used to be at the Cale and Caddo prairies. There is fair shooting there yet. While in the Choctaw Nation last spring, the writer learned from settlers that a great many birds were in the Jones' pastures, which are about fifteen miles east of Caddo. Carriage Point was another favorite resort, and thousands of birds have been killed there. It is now said that there is not a covey in the entire section. The best hunting country in the territory was on the prairies in the Creek Nation, at Checotah, Honey Spring, Summit and Muskogee. A few years ago hundreds of Denison sportsmen visited annually the chicken grounds of the Creek and Choctaw Nations and made enormous bags, but the birds have been 'shot out,' and good sport in that section is a thing of the past."

Minnesota Chickens.

The chickens of Minnesota this year are a fair crop, the weather conditions over a good part of their natural breeding grounds having been more than ordinarily favorable for them. The district wardens have been vigilant, and the gradual education of the people of Minnesota by the able game commission is slowly beginning to be felt, so that the violations of the chicken law are nothing like what they formerly were. It is confidently stated that the crop of chickens will be a great one, and that sportsmen may count upon good shooting. This, I am sure, is true, as true as any such statement can be for any chicken country. Yet this does not mean that all shooters will have good shooting, nor that all shooters will find country where the birds have not been shot into before the opening day. I know there are chickens still in Minnesota, for I had a very nice little shoot last fall with one of the local deputies and we found plenty of birds to satisfy us. But what we need in Minnesota, as we do in every Western State, is more law, more wardens, more popular respect for the chicken law, less of this old-time thievery of the State's property. It was said that the safety of the frontier required the killing off of the buffalo. Is it the belief of the man with a gun that a like extermination should be meted out to the big grouse, lest it give aid and comfort to sportsmen?

Gokey, of Dawson.

My friend Gokey, of Dawson, N. D., has got him

new typewriter, and we correspond that way now. Gokey writes to me: "It has been some time since I heard from you, and I thought I would write to see if you are going to have on your shooting clothes this fall. Hunt them up and come on out here. The lakes are full of ducks, and lots of them are tagged for Gokey & Co. I hope to see you and Mr. Waters here again, so I can wipe your eyes. [He didn't do it. He was under the wagon!] Chickens are more plentiful than for several years, and the lakes and sloughs are full of ducks and geese. I have a number of engagements with parties booked from Boston and New York, but if you will come I will find time to care of you."

I hardly think it likely I will see the wonderful shooting country around Dawson again this fall, but I know I should like nothing better were it possible, and I shall never forget the afternoon that Mr. Waters and I had with State Warden Bowers and Gokey, of Dawson. It's a bit far-offish to sit in an office and write about sport; but that was the real thing.

The Bannocks are Out.

Telegraphic advices of Aug. 12 state that some forty Bannock Indians have appeared in the Jackson's Hole country, and have been slaughtering elk. Deputy Warden Pyle has wired Gov. Richards that the Indians have successfully resisted arrest. Secretary of the Interior Bliss has advised Gov. Richards to call out troops from Ft. Washakie to drive back the Bannocks.

Michigan July Grist.

State Warden Osborne, of Michigan, reports that in the month of July just past he made twenty-six arrests and secured fifteen convictions for violations of the game and fish laws.

A North Dakota Game Region.

Mr. J. E. Galehouse, Jr., deputy warden at Carrington, N. D., writes me that he is in one of the best goose, duck and chicken regions of the State, and adjacent to canvasback waters which are as good as any. "The young of the above birds," he says, "are in plenty this year, and the year promises to surpass former years in their numbers, especially of chickens and grouse." Mr. Galehouse will answer inquiries for chicken country.

Mr. Charles Stewart Stobie will leave about Sept. 1 to join his friend, Major James B. Thompson, of Denver, Colo., they two outfitting at Glenwood and going north into the country about the middle fork of the White River.

The item last above given is simple enough in the statement, but it is well worth more than the statement. Mr. Stobie is going back to the West because he loves the West, and has known it for very many years. In the old, old days, when the old Crawford Opera House, of Chicago, was headquarters for the artists of this community, Mr. Stobie was an appreciated member of that Latin quarter. He was an associate of Earle, Elkins and others of the Chicago artists, who have made a name or gone over the range. Away back in the early days there was a real West, and Mr. Stobie was drawn to it, as many men would be to-day if such a country existed. He has to-day the real right to the title of old timer, although he carries his years so lightly that he does not seem to date back to the early days.

Yet he was ten years among the Ute Indians, living with them and studying them, and learning them as few men have ever done. He knows the old-timer's chart of the West, and was on the buffalo range at the time the first skin-hunting parties began to come in and to kill the buffalo for their robes alone. He saw the passing of the buffalo, and saw the changed conditions which have hedged in the hunting of the Indians and of the white men. He has gone back to the West from time to time, though latterly his home has been in Chicago. He ought to be satisfied to dwell in the cities, but someway the fascination of the old days comes along once in awhile and takes him back into the mountains, which are still peopled, at least with the ghosts of the past. In the old days Mr. Stobie's frequent associate and hunting companion was Major Thompson, and the two are going back for a look at their old country. They will have some good bear dogs along, and expect to get a lion or two, and perhaps have some fun with a bear.

Speaking of mountain lions, Mr. Stobie relates to me the third instance I have known where a mountain lion has really been known to attack a man. Of course, a great many such stories have been printed, but I mean the authentic stories, describing real incidents. Mr. Stobie says that one time, when he was riding horseback along a rocky trail, he heard the swish of a lion's tail in the leaves, and looked up barely in time to lean forward as the lion sprang at him. The animal missed its aim and fell beyond the horse, Mr. Stobie firing at it with his revolver as it fell, but not hitting it, as the horse sprang away. The creature seemed to have the idea that it could eat up a whole horse, and incidentally a man. A great many rather vivid things used to happen in those days, and Mr. Stobie tells me of one little bear fight in which he saw some mounted Indians mixed up with a grizzly, or rather a silver tip, which Mr. Stobie does not consider to be a grizzly. The young braves crowded in about the bear, trying to do the bow and arrow act with it, and one of them got too close. The bear made a swipe with its arm, and struck the pony of one unlucky Indian upon the haunch, stripping all the flesh off the hip of the horse clean to the bone, and knocking both horse and rider in a heap. At least one observer of the incident came away impressed with the strength of an able-bodied bear.

I should be depriving myself of a pleasure if I did not speak of the visit of Mr. Stobie to the art rooms where some of his paintings are on exhibition. Here I saw the cowboy of the West, as he was and still is in some parts of the West. I saw the Indians of the old days, the chiefs painted and decorated in their war shirts and bonnets, the latter as they used to be made in the days before the white men came, not as they are made now for sale in curiosity shops. Here you saw the real color and the atmosphere of the West, and its former people stood before you, so that the first thought was one of thankfulness to Mr. Stobie, as to a very few other men of this country, that they are securing to future generations the opportunity of seeing what this country once was and what were its inhabitants. A great many men are now doing that sort of thing in one way or other, but Mr. Stobie can tell some of them, very calmly, about how such and such things used to be before they were born! It always sort of cools me down to have anyone tell me about things that happened before I was born. Of course, the first impression of a human being is that what happened before he was born, or which will happen after he is dead, cannot be of much real importance to the world, but there were happenings in the old West of which people will some day read on the printed page, or on the pictured canvas, with an interest more absorbing than that which they now accord.

A Real Hot Lynx Story.

In the columns of the daily press you get a great many stories of terrific encounters between men and wild beasts. I have had occasion to say that I have heard of three cases where a mountain lion has attacked a man. In one of these cases the beast thought the man was a deer. In the Sunday papers I have read of many cases where "panthers" have had awful fights with men, the men always coming out victorious, and with their dialect uninjured. In the Sunday papers you read of bear fights happening in Maine and Pennsylvania, or elsewhere within the natural range of the New York Sunday papers, in country where there never was any bear but a black bear, which latter animal never did have as much fight to him as a healthy hog. You read also of horrible fights with immense lynxes, which latter usually weigh at least "80lbs." In the lynx fight there is always a great deal of blood shed, and the hero goes to Congress, or something of that sort.

I wonder how it would seem to readers of the fakes of the daily press on such matters to read an actual lynx story, just as it really happened, without any coloring? I have such a story before me now, from the hand of Fay L. Buck, a young man who lives at Manitowish, Wis., where I met him and went out trapping with him one winter. Fay Buck is a powerful young fellow, a fine woodsman and guide, and the best about him is that he tells the truth. He is about as much afraid of a lynx as he is of a woodchuck, and it appears that when he wants any young cats of that kind he doesn't mind the mother of the litter very much. This is his story:

"I had a little experience with some lynxes the other day which may be interesting to some of the readers of FOREST AND STREAM. I went out to pick some raspberries for my guests, when about half-past ten in the morning I heard a peculiar noise a short distance away, and being rather inquisitive, I went over to see what was going on. To my surprise I found an old lynx and two young ones. As soon as they saw me the two young lynxes started to climb trees, each one a different tree, and the old one ran off.

"Now, how was I to capture the young ones alive? I had a string or piece of heavy fish line about 2ft. long, and I made a slip knot in one end and tied a stick about 3ft. long on the other end, in the middle. I took off my shoes and proceeded to climb the tree. The first lynx was up a little dead maple tree, close to a birch stub. The limbs on the tree were dead and would break off when I touched them, which made climbing very difficult, but, of course, the little fellow went to the top, and so did I. He appeared to be very much annoyed, but by a long struggle I got the slip noose of my string on his hind foot. He then jumped over on the birch stub, and I let go of the stick which was at the other end of the string, and the weight of the stick on his hind foot slowly took him to the ground. I managed to be at the bottom of the tree as soon as he was, and to my surprise the old lynx was hid and I did not see her until she sprang. She struck me in the back just before I let go of the tree, and she tore my shirt half off. I whirled and struck her with my fist, and picked up a club, and she jumped one side. I then picked up the young one that was fastened to the string, and carried him off about ten rods, where I left him. This drew the attention of the old lynx while I went back after the other young one, which was at the top of a large burnt hemlock.

"This was not a very encouraging job, as my shirt was about half gone, but anyway I proceeded as before. I got to the top, and the limb the little fellow was on broke and he fell to the ground and hid under some brush. I got down carefully, threw a stick across him and stepped on the stick until I slipnoosed his hind foot. Then I had the two young fellows safe.

"There was an old burnt lumber camp close by, where I found an old tin boiler with a cover to it. I put the two lynxes in it and carried them home. My berry picking was quite successful, I thought. The old lynx followed me for about a mile. I have the two young ones, which are about two months old, in a cage about 8ft. square, and they are doing well. I was a pretty sight when I got home."

This is a real lynx story, written by a man who has not gone to Congress, and who is not the oldest inhabitant. It's a pretty good story, and it is true.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Deer in Vermont.

ST. JOHNSBURY, Vt., Aug. 11.—The rumored complaints of farmers whose crops were being destroyed by deer, and the stories of deer being herded with cattle and hanging around the mowing lots to pick up the hay left by the rakes, and of locomotive engineers who were compelled to slow down to avoid breaking the law regarding killing deer out of season, would lead a stranger to suppose that the State of Vermont had become one great deer park, and that an amateur sportsman could kill all the deer he wanted anywhere during the open season. The facts are that deer are plenty, and good sport may be had by experienced gunners, who seek them in the territory where they abound, but in many parts of the State deer are as scarce as they are in New York city. I saw Mr. John W. Titcomb, State Game Commissioner, and he said: "The increase in deer is due to the natural increase of wild animals when protected by the State for a reasonable number of years, and the turning out of a number of deer by private sportsmen a number of years ago. Last year there were perhaps 150 deer killed in the State, 104 of which were reported to me. The largest number, thirty-one, were killed in Windsor county; twenty-six in Rutland county, and four were reported from Essex county, and three from Orleans county. This would lead to the conclusion that the deer were bunched in the region west of Rutland in the southern part of the State. I believe there are more deer, and that there will be better sport in this State this fall than anywhere within the same distance of New York city."

Many experienced gunners say that while Rutland county may contain more deer than Essex, Orleans or Franklin counties, yet they would advise amateur sportsmen to go into the extreme northern part of the State and start in say at Hyde Park, Barton, or some smaller towns in those counties. It is always advisable, and in some places absolutely necessary, to employ a guide.

EXEGISIS.

The Distinction is Merely Technical.

Editor Forest and Stream:

I have read every copy of the FOREST AND STREAM from its first number and (while I may be easily pleased) I have never read an editorial that I could take any exceptions to, on the contrary, have been able to endorse them most heartily.

Yours this week, "Essentially a Thief," is all right with one exception, it should be a thief. No man has a right to shoot or fish until the day of the open season, and any man who does it is a thief pure and simple. I can't understand how a man can steal game or fish and excuse himself. I know men who would not think of breaking any other law, would not steal anything, but do not hesitate to violate the game laws and steal game and fish.

I hope the time will come when men will not sneak into a cover two or three days before the open season any more than they would into your barn and take your horse.

The good work has been going on in your office for years, trying to bring men up to the high standard which all sportsmen should occupy, and as we all know your efforts have not been in vain. Let the good work go on. Pound the game thieves, stick to the old plank, stop the sale of game, go for the market shooters and go for the violators of the game laws as you have in the past, and you will have your reward. H.

HUDSON, N. Y., Aug. 11.

California Game.

REDLANDS, Cal., Aug. 1.—The writer, with two others, has just returned from a burro trip to Bluff Lake, Bear Valley, etc. We took along two cameras, and got a lot of views. We saw lots of gray squirrels and mountain quail. I saw one brood of quail that were fully grown and another just large enough to fly. There were three deer killed in the mountains south of Gus. Knight's Bear Valley resort last week. One of our party saw a deer and also a mountain lion. We did not fish any, as the trout are all about caught out. We only killed a few doves and squirrels, the former before we left the valley at home. Several parties here have been out for deer, but no deer have as yet been killed by any of them. There is a warden in the mountains, and he keeps pretty close watch over the game. There are lots of valley quail and rabbits, and there has also been some dove shooting. The band-tail pigeons have come down out of the mountains, and some shooting may be had in the elder brush around Yucaipe.

REELFOOT.

To Study the Yellowstone Park.

WASHINGTON, Aug. 13.—Commissioner Binger Hermann, of the General Land Office, will leave Washington to-day for his home in Oregon. Before returning he will visit the Yellowstone National Park and reservations in California, with a view to studying the needs of those parts of the public domain.

Honesty the Best Policy.

I.

Amateur Sportsman—"Confound it all! Been out all day and haven't shot a thing. But I'm not going home empty-handed, and here comes just the boy I'm looking for.

II.

"Say, boy! I'll give you twenty-five cents each for those birds. You'll take it? Good! You have eight. Here are two dollars.

III.

"Oh, say! Talk about being proud when I walk back through the city with this string of birds! Of course I will have to do some tall lying, but that doesn't count. Put them in my bag? Nit!"

IV.

Stranger—"Good aft'noon, neighbor! Had putty good luck to-day, eh?"

Amateur Sportsman (loftily)—"Oh, fair!"

Stranger—"Shoot 'em all yourself?"

Amateur Sportsman (tartly)—"Certainly I did. Do you think I hire a man to do my shooting when I go gunning?"

V.

Stranger—"Well, I'm glad to hear it! I'm game warden of this county, and them birds is out of season. It will cost you just five dollars each fer shootin' 'em. Come along with me to the 'squire's office and settle up."

VI.

Amateur Sportsman (making for the train to the city)—"Confound it all! This sporting business isn't what it is cracked up to be. Forty dollars, besides my expenses! And they confiscated the birds, too!"—Puck.

Sea and River Fishing.

roprietors of fishing resorts will find it profitable to advertise in Forest and Stream.

Where to go.

One important, useful and considerable part of the Forest and Stream's service to the sportsmen's community is the information given inquirers for shooting and fishing resorts. We make it our business to know where to send the sportsman for large or small game, or in quest of his favorite fish, and this knowledge is freely imparted on request.

On the other hand, we are constantly seeking information of this character for the benefit of our patrons, and we invite sportsmen, hotel proprietors and others to communicate to us whatever may be of advantage to the sportsman tourist.

The Canadian Salmon Rivers.

As is explained in another column, the following letter has been sent to us for publication, in order that being here printed and thus coming to the attention of those whose interests are concerned, other salmon anglers may be prompted to communicate to Mr. Davison facts and opinions which may corroborate or correct the statements and views set forth. Mr. Davison's address is No. 56 Wall street, New York.

New York, July 22, 1898.

Hon. E. E. Tache,
Ass't Com. of Crown Lands, Forests and Fisheries,
Quebec, Canada.

My dear Sir: Complying with your request, I put in writing the matters concerning salmon fishing in Canada, the future preservation of salmon, and the comments on existing influences tending to diminish the supply, which I laid before you orally a few days since.

I am the more pleased to do this as I understand that recent decisions concerning the jurisdiction of the Province place the control of these matters in the hands of the Provincial rather than the Federal Government; and that the opportunity afforded is to be availed of to initiate measures looking toward continued and increasing activity in the care of this valuable asset of the Province of Quebec.

As you know, the westerly limit of salmon in Canada has been steadily receding. The conditions which affect the question are constant, nor have they as yet been successfully met. The result must be a continued diminution in the supply, with the ultimate disappearance of salmon as a game and food fish from your waters, if indeed not from the entire Atlantic coast.

The evil has now reached a point which brings the end in sight, and the situation is at the critical period—so much so indeed that further temporizing will result in the near future in a serious loss both of revenue and food supply, which it will be difficult to replace.

A Review of the Past.

The natural history of the fish justifies this conclusion. Before going into it I call to your attention the paper prepared for the Canadian Institute by the Rev. W. A. Adamson in 1856 on "The Decrease, Restoration and Preservation of Salmon in Canada," the interesting character of which essay it would be difficult to overestimate.

In speaking of then attendant conditions he says: "It is unnecessary to magnify the importance of this fish as an economic production or as an article of commerce. As a food it is beyond comparison the most valuable fresh-water fish, both on account of the delicacy of its flavor and the numbers in which it can be supplied. By prudence, a little exertion, and a very small expense now (1856) it may not only be rendered cheap and accessible to almost every family in Canada, but also an article of no small commercial importance as an export to the United States, *in which country, by pursuing the course which Canada has hitherto imitated, this noble fish has been almost exterminated.*"

Continuing, he points out that twenty-five or thirty years before every stream from Niagara Falls to Labrador and Gaspé Basin abounded with salmon, while at the time of his writing none are to be found west of Quebec except a few in the Jacques Cartier. He points out the natural disposition of man to destroy at all times and seasons that which has life and is fit for food, refers to the neglect to construct fishways in the dams; and points out how (at that time) the St. Marguerite and Petit Saguenay, the Escoumain, Port Neuf, Rimouski, Metis and others rivers were blocked by dams.

A somewhat earlier paper by W. Henry, Esq., inspector general of hospitals, on the habits of the salmon family, also contains much of interest and warning. He speaks of the fish as being then still found in the Kennebec and the Connecticut, and of an occasional stray fish in the Hudson and the Delaware. He refers to the fact that at the time of his writing many thousands ascended the Ottawa, while a large body pushed up the main river all the way to Lake Ontario, and following the north shore of the lake, were often speared in the Bay of Quinte and at the mouth of the Trent, and caught in considerable numbers about Toronto in the streams running into the northwest extremity of Lake Ontario. He speaks of seeing a salmon leap in 1833 in the Niagara River, when crossing the ferry just below the Falls, though it was then already a rare occurrence, and he begs for "some legislative protection for salmon" as being "much required in Canada," stating that their numbers are "sensibly diminishing." This diminution he places at a loss of a quarter of the whole within the ten years preceding his writing.

In a valuable paper on fishing in New Brunswick, by Col. Sir J. E. Alexander, F. R. G. S. and A. R. S., written in the fifties, the author, speaking of the Miramichi, says it should be "better protected and not poached, as we observed it was." Also that it has always seemed to him that "there was wonderful shortsightedness or remissness in many quarters as to the preservation of fish, particularly of the best of all, the salmon." Says they are "now sensibly diminishing yearly." Mentions mill dams which lack fish ways, nets set across the stream barring the fish from the rivers, and the spear and torch completing the work of destruction "at a time too when the fish were quite unfit for food"—on the spawning beds and after spawning.

The same author, speaking of the St. Johns in New Brunswick, then an excellent salmon river, says that not a fish was caught above the dam of the Nashwaak, "where for forty-six miles they used to be in abundance"; and mentions that on the Nerepis, another tributary, there was no dam, with the result that a large number were barreled at the mouth of the river annually. Speaking of the Salmon River, another tributary of the St. Johns, he records the destruction of its fish also, by a mill dam.

Also I call your attention to the report of the Commissioners of Crown Lands of Canada for the year 1860, when the protection and regulating of the salmon fisheries in lower Canada was for the first time undertaken. It mentions an immediate "increasing run of salmon into the principal breeding rivers," and "hopes for a vigorous persistence in the policy approved as beneficial."

Finally in the interesting volume (edited by Col. Alexander, published in 1860), "Salmon Fishing in Canada" (by a resident), which deals with the author's angling experiences from about 1840 to about 1860, the author says on this general subject: "It is, however, a regretable fact that the extermination of this noble fish has been commensurate with the civilization and settlement of the country * * * and it is no small reflection upon the legislatures of the country that they have suffered such a valuable article of commerce to be so wantonly and recklessly destroyed."

Speaking of the Godbout in the year 1853, this author mentions that during the whole of that season "the Hudson Bay Company had twelve barrier nets across different parts of this beautiful stream. Some were actually in the very best of the pools. A suicidal policy," etc.

Results of the Policy of Conservation.

This being then the record and warning of those times, let us consider how far the policy initiated in 1860 of conservation has been effectively applied, and with what results.

The record to-day is not an encouraging one. Salmon have disappeared since then substantially from every river west of the Saguenay (there is an occasional salmon still in the Malbaie [Murray], but the exception may prove the rule, I suppose), and there are, moreover, at least several rivers which can be named between Tadousac and the Atlantic on both the north and south shores which are no longer much, if at all, frequented by them.

The next batch of your rivers from which the salmon will now very soon disappear are the six tributaries of the Saguenay (or seven, counting the little Riviere Rouge, which, as I mentioned to you, salmon appear to run into). These six, the à Mars, Eternity, St. Jean (Chicoutimi), Petit Saguenay, and the North and East St. Marguerites, are exposed as to their salmon supply to an extreme of peril by reason of the fish being compelled on leaving the St. Lawrence to pass through the waters of the Saguenay before reaching their respective rivers. During the past three years the poaching evil has increased enormously in this vicinity. As was said to me by a well-informed habitant of the locality. *"Ils se sont enrages a rayee."* This has been attributed, I regret to say, to a local slackness in relation to the enforcement of the Government regulations, while prosecutions of detected offenders have been substantially valueless. For example, I might cite a well-known case a couple of years or so ago of eighteen individuals summoned before a magistrate, and who upon conviction were fined $2 each, they having taken (in that instance by netting a pool) thirty-two salmon.

One of the troubles in the main Saguenay arises from the fact that there are a number of small sailing vessels (goellettes, schaloupes, etc.) regularly engaged in the trade of carrying cord wood to Quebec from the Saguenay. Habitants in the adjoining townships cut and stack the cord wood at convenient places on either bank of the river, and these small vessels, taking considerable time to the trip, often anchoring at night, proceed down the river collecting the wood at one place and another, and transporting it to Quebec for sale. It is hardly exaggeration to say that during the past three years it has become almost a matter of course for many of these boats (as also for other schaloupes belonging in the Saguenay villages) to carry a net as part of their equipment. In the early morning, as they progress down the river, the embouchures of the tributaries and other likely spots are investigated; if salmon be found a net approximately closing the mouth of the river is promptly set from a convenient point, and in a few hours a substantial return in salmon is the result, especially if there be a spring tide.

To give you actual example. This present season (1898) the mouth of the river next to the one I fished was netted the day before the lessee arrived; while as for our own river we were much interested to learn (ten days after arrival) that it had been netted on the morning of Monday, June 27 (we arrived somewhat after midnight on the 25th). Indeed on passing down to the mouth of the river in a canoe after midnight on the 25th I saw in the distance the anchor light of the goellette, which there is every reason to believe was the boat which netted the embouchure twenty-four hours afterward.

Habits of the Fish.

Were it not for the natural history of the salmon, one might look with a little more equanimity on the destruction of the fish in a particular river, but the facts relating to salmon have become, by long and patient study of this now best understood of fish, too clear and too well established to admit of doubt. It is not too much to say that the closing of a river by a barrier net or mill dam for five years will definitely exterminate the fish in that river for all time until the particular river is restocked, and that it will take four years of rigid protection from the time of thorough restocking before the river is restored to any productiveness.

Assume, as is now more or less conceded, that each river has substantially a "double supply" of fish—by reason of a portion of the smolts not going to sea until the second year (in the third year of their existence), as also from the probable fact of the non-return until the next year of a certain proportion of the grilse of each year; even with this allowance, five years of either closing by a mill dam or barrier net, or five years of thorough extermination by netting on the coast and in the main river, with subsequent netting in the pools and ultimate spearing on the spawning beds, must necessarily exterminate the fish of that river.

The salmon, while a sea-going fish, nevertheless has as a distinguishing characteristic the instinct of returning each to its own river.

Spawning occurring during the autumn, the young of the early spring pass a period of at least a year as fry and parr, a second period of about a year as parr and smolts, and visit the sea for the first time at the end of the second or during the third year of their existence, returning from their first visit as grilse, and from their second visit as full-grown salmon, to spawn in their turn in the river of their birth.

Assuming that there are at any given time not in excess of two years' supply for the particular river at sea, and three years' supply in the river (in the various stages of development mentioned above), it would follow that persistent netting and spearing or exclusion for five years will definitely remove any given river from the category of a salmon river; and since, except for the accidental wandering of an occasional fish, no other salmon will enter the river, it is apparent, as said above, that a river once despoiled cannot be reinstated without restocking, nor until the fourth year thereafter will it produce full-grown fish.

Results of Poaching.

It may be asked, however, whether poaching can be so persistent as to take all the fish. Consideration of the facts answers the inquiry substantially in the affirmative. Salmon, in the spring as the water warms, come in from the sea. Reaching shallow water, they coast along the shores until they reach the river in which they belong. Ordinarily they wait at its mouth for a day or two, sometimes even till a spring tide aids or induces their entering. On entering their own river they mount a rapid or two and reaching a pool select each a spot at its foot—often in front of some submerged rock, which will divide the current for them—awaiting some rise in the river, from local rain or other cause, to impel them to mount again to upper pools. As the summer progresses they drift to the spawning beds and lie more or less inactive. The majority (probably) return late in the fall to the sea. A certain proportion, however, remain in the river, and return to the sea only in the early spring (another evidence of the probability of there being a two years' supply of salmon for each river at sea at any given time).

All this is well understood, and in it is found the opportunity for the destruction of the fish by improper taking which has now become so serious an evil.

Poaching Methods.

Salmon poaching in Canada may be subdivided roughly into four classes: (a) the illegal setting of nets under Government fishery licenses—i. e., keeping them set longer than permissible and at forbidden times; (b) illegal netting from points on the coast and at the embouchures; (c) netting the pools in the river themselves; and (d) spearing.

The first two classes are substantially the same. The fish coasting along the shore of the Gulf or the St. Lawrence run the gauntlet at numberless projecting points of either a licensed fishery net or of an unauthorized net, extending from the shore. These fisheries are often or generally situated, and the illegal netting is done principally at the mouths of rivers, where the fish belonging to the particular river naturally trend still closer inshore and turn into the embouchure. If a salmon has fortunately been too far a-stream to be taken, or has succeeded in freeing himself from the net and doubling the end of it (and fish are not infrequently taken on the fly bearing the net marks on their necks), and has been fortunate enough to pass each net of the many between the point where he first reached the Atlantic coast and the mouth of his own river, he then becomes exposed to the further perils mentioned.

Necessarily the further to the westward a given salmon must proceed before reaching the river in which he belongs, the more nets he must dodge. The westward stream of fish steadily diminishes as it proceeds. The salmon belonging in the Esquimaux may lose but a very small percentage of their number before they reach that river, while but an inconsiderable fragment of those destined for a river well to the westward can hope to elude the dangers of the ever recurring net.

Assuming, however, that a fish has escaped; has reached his river; has not been taken (while sporting at its mouth or attempting to enter) by the poacher's hastily dropped barrier net, or the illegally constructed or improperly set "licensed" net; has mounted to a pool; and with his companions is lying at its foot. It hardly takes ten minutes to stretch a net across the upper end of the pool, allowing it to drop throughout its length to the bottom of the river and with its top level with the surface. Under even unfavorable circumstances the most that need be done in the way of preparation for stretching the net would be to fell a tree on each side of the river so that their trunks will extend down into the water, that the ends of the net may be attached to them. The poachers, passing then down to the foot of the pool on either side, by beating the water with saplings and throwing stones into the center of the stream, start every fish up stream in alarm. A few seconds afterward all the salmon in the pool are fast in the net. To draw the net takes but a few minutes. Indeed I am credibly informed that the entire operation of netting a pool can be thoroughly performed with ease in half an hour, substantially without noise and without lights.

This routine may be a little varied by the local circumstances of a particular pool, but is substantially the same in most cases, and it is apparent that it is wholly

beyond any such remedy as has been attempted in one river, i. e., the sinking in the pools of casks filled with stones, with spikes driven through from the inside, in the hope that the nets would be torn and destroyed and netting the pool made ineffective. This would be of some use were the nets literally "drawn" in the pools.

If in giving these details I were telling any secrets or giving any information not known to hundreds of poachers in the Province of Quebec, I might be reluctant to furnish the particulars, but the information is common to all, these methods are practiced by many, and a recognition on the part of the department of the methods of poaching followed in the Province is a condition precedent to exercising restraint thereon.

The final tragedy for the salmon—spearing—is more largely practiced to the eastward, where there are still some considerable number of fish left. As to the more westerly rivers, they shrug their shoulders and say it is too much trouble and hardly pays any more—the fish have become too scarce to make it worth while.

The manner of taking fish by spearing is of course well understood by all. The outfit is simple. Five cents worth of iron will make a spear-head; a sapling answers for a shaft; a roll of birch bark makes a flambeau, and a canoe (or even two logs lashed together on a still-water) completes the outfit. It is perhaps more generally practiced later in the season, when the fish are lying on the spawning beds or are in the still-waters, and many of the fish taken by spearing are therefore unfit for food.

As for any diminution in the supply of salmon through the legitimate rod and line catch, it is sufficient to say that the number of salmon taken on the fly throughout the Province of Quebec (which realizes substantial revenues from the lessees of waters for that purpose) is so utterly inconsiderable as to be of no importance whatever. Were this catch multiplied by ten and continued for a thousand years it would make no impression upon the number of salmon.

The facts which I have given can be easily confirmed. For example, I had no difficulty in ascertaining that netting in the Saguenay began this year on May 20, the fish taken being believed to be those which had remained in the rivers through the winter and were drifting down to the sea. On one day this spring in passing some twenty miles along the Saguenay a local habitant tells me he passed seven nets set. Another habitant dwelling on a river told me this spring that last year, being aroused about 10:30 at night by his dogs barking, he went out of the house and found seven individuals with canoes, spears and other paraphernalia (N. B.—He told me also the town they came from) mounting the bank of the river to proceed to the upper pools.

No ordinary preventives possible to lessees can, lacking the active assistance of the Government, improve this state of affairs. A guardian's house at every pool, necessitating anywhere from four to a dozen or more permanent guardians on each river, will not suffice, if prosecutions are adjourned until lessees, being absent, must journey many hundred miles to attend a trial, and if the results of successful prosecutions are nominal fines or discharges. Nor can a guardian be on watch both day and night continuously, even if there be one at every pool; nor can a single guardian successfully oppose a number of (let us say armed) men encouraged to persevere by a lax administration of the laws regulating the improper taking of fish.

In saying what I have I would add that I have been actuated more by the consideration of the importance to the public of the preservation of the fish than by any personal interest; for I have, as you know, given up any idea of fishing any longer in rivers to the westward, and a sufficient supply still exists in some of the extreme easterly rivers to afford tolerable fishing for some years to come.

Practicable Remedies.

As to remedies, they are, if earnestly followed, simple and easy of application. There should be:

First. (a) Comparatively few Government licenses.

(b) No license to set a net within 400yds. of the embouchere of any river should be granted (for the reason that nets at the mouth of a river take substantially that river's supply instead of taking toll from the general supply for all rivers); in other words, netting within an estuary should not be allowed.

(c) Licensed nets should not be allowed to be kept set for more than three appointed days in each week, and the days should be uniform throughout the province.

(d) There should be absolute forfeiture of any fishing license for infringement of these rules.

(e) The extinguishment (by capitalization or purchase) of seigniory rights—if the same are not subject to Government rules—would in the end be a profitable investment of Government funds.

Second. Two small and (even moderately) speedy steamers should be employed from May 1 to at least July 15 patrolling the shores. These steamers should have no appointed time for visiting localities, nor should they follow any regular order of visit; and they should not limit their patrolling wholly to the daytime. Those in charge of them should be properly authorized to search without a warrant any suspicious vessel for nets or salmon (I refer you to this year's amendments of the New York game laws, and the discussions which led thereto as to the necessity of authorizing game constables to search on suspicion).

Third. The sale of salmon should be regulated. There would be but little difficulty in establishing a Government depot in Quebec, Montreal and other points where salmon are sold as a commercial product, or in allowing their sale or exportation only by licensed merchants, who should be under bonds not to purchase from unauthorized vendors.

Fourth. There should be, of course, forfeiture of any salmon illegally taken, and forfeiture of any nets illegally possessed or improperly set or constructed or found illegally in use.

Fifth. A rapidly ascending scale of fines, and in the case of a persistent offender imprisonment.

Sixth. The department itself should undertake the prosecution of offenders upon information from lessees and others. (This is a matter of very considerable importance.)

Seventh. Guardians of rivers should be authorized to seize and destroy nets, spears, canoes and other implements illegally being made use of, and should be authorized to arrest without warrant and convey before the nearest magistrate anyone found actually offending or on the leased land under suspicious circumstances, and such magistrate should be required to hold the accused to bail in a sufficient sum to secure his attendance.

Eighth. Fishways and sawdust:

(a) No mill or other dam should be allowed to be erected in any river below the lowest impassable falls (the location of which should be established for each river by your department) without an approved fishway being constructed therein.

(b) The detailed plan of the proposed fishway for any proposed dam should be filed with your department, and the dam should not be permitted to be constructed until the proposed fishway was approved.

(c) The owner of every dam containing a fishway should be required to certify on oath to the department between the first day of April and the first day of May in each year that the fishway was unobstructed and still remained passable for fish, and that the same had not been obstructed or impassable since his last previous certificate.

(d) All fishways should be at least once in three years inspected by your department.

(e) As to all dams now existent below the first impassable falls, the owners or those benefited by the existence thereof should be compelled to construct proper fishways on plans approved by the department by the first day of May, 1899. Penalty for failure should be heavy and rigorously exacted. (All such dams now abandoned should be blown up.)

(f) The discharge of sawdust into any river is wholly unnecessary, and should be more rigorously prohibited than it is at present (substantially all your rivers are at least potentially salmon rivers, and are certainly trout rivers). No statement that a river is not a salmon river should excuse the discharge of sawdust into the stream—by the way, one often sees considerable amounts of floating sawdust in the main Saguenay, which hardly adds to its picturesqueness or attractiveness for the tourist.

Restocking.

There remains now the further subject of restocking depleted rivers (which ought to be wholly unnecessary).

I call to your attention that the restocking conducted under your department is, as I understand, wholly by means of placing fry in the rivers or their tributaries. This, while an earnest and desirable effort, is largely useless, taking into account the necessary trouble and expense, as compared with restocking with in the case of trout, fingerlings, and in the case of salmon, parr. A hundred fingerling trout or a hundred parr are probably worth more in a river than 5,000 fry. Even if the loss at the hatcheries of raising them from fry should be 50 per cent., the gain from stocking with parr would be enormous. This is well known, and indeed any experienced fish commissioner would gladly give you figures and details. I believe that Mr. Cheney here in New York State, to whom the angling fraternity owe so much, has conducted some interesting and I think successful experiments in this direction, which, if I remember rightly, he looks on as dictating by their results in what direction future effort in restocking should be made; and the director of the hatchery at Tadousac, with whom I had the pleasure of speaking on the subject a year or more ago, I think agrees with these views, and it is only the lack of facilities for raising parr at the establishment that prevents the idea being put into effective operation.

Another point of importance in this respect is studying the local conditions in relation to the placing of fry in particular rivers. For example, as to one river it appears that for lack of full knowledge of local conditions the stocking has been done by depositing fry annually for some years in a certain lake. This lake I happen to know. It is a dark, narrow tarn among the mountains, perhaps a mile long and a quarter of a mile wide. It produces an active, robust and dusky, though small trout. It connects with the particular river by a little stream perhaps five or six miles in length, with several very steep descents. The conditions are such as to make it improbable that any perceptible percentage of the fry, if they survive to make as smolts the attempt (and I doubt if one in a thousand of the fry has escaped the trout), could reach the main river alive. The outlet of the lake is very small, is at one extremity, and but a few feet of water per hour flows through it. Upon inquiry, I learned that it had been believed or reported that there were no trout in the lake; also, that the road did not continue beyond it, but unfortunately neither supposition is the fact.

It may be said that it has not been demonstratively as yet established that parr placed in a river (instead of fry) would acquire as to it the "animus revertendi," but it is at least sufficiently probable to make it a neglect of expediency not to make the experiment; and a three years' experiment in a single, now wholly depleted, river would establish the fact definitely one way or the other. Moreover, as to restocking, no river not literally "poached to death" needs stocking. Natural increase will much more than keep up the supply of salmon so far as rod and line fishing and legitimate netting on the coasts under proper regulations are concerned, while as for rivers which are thoroughly poached, it seems mere waste of money and of effort to restock them without dealing with the poaching question, and without regulating the excessive and illegal netting. Moreover, unfortunately the existence of hatcheries and the earnest effort now made toward restocking produces necessarily a feeling that the salmon industry is being fully cared for, and almost discourages further or more practical effort.

It would be far better for the future of this valuable asset of the Dominion to abandon the hatcheries and regulate the poaching, than to continue the hatcheries and do no more in the future than has been done in the past to protect the natural supply of fish. I doubt if the Province of Quebec will appreciate—until the moose have been slaughtered in their yards, the caribou killed off for their hides, the smaller animals snared and trapped at all times and seasons, and the salmon exterminated by poachers—how many visitors are brought annually and how much money expended within her borders by those attracted by the game in her forests and rivers. When that time comes the expense and difficulty of rehabilitation and the loss of revenue in the meantime will afford a lesson.

In closing, I venture to direct your department's attention to the excellent results of the system of comparatively uniform protection to game produced in so short a time in Maine; one of the most interesting features of which is the hearty concurrence of the guides and others, who, it had been supposed, would think their interests lay in the opposite direction, and the ease with which the people of that State have been educated to a better appreciation of what policy was the best for their material interests.

I remain with great respect yours, etc.,

CHAS. STEWART DAVISON.

English and American Anglers.

BY FRED MATHER.

THAT the American inherited his love of angling from his English, or rather British, ancestors is true, for angling in other countries is in a crude state, and is regarded rather as a means of getting fish than as a sport. Yet there is quite a difference in the anglers of the two countries, in temperament more than in methods, and I will try to sketch the differences.

The Scholarly Angler.

England has held a majority of this class since, and even before, the days of Walton. Under this term may be included men of literary tastes to whom their own fishing experiences only serve to whet an appetite for the subject outside of books which merely treat of baits and tackle—men who are familiar with the works of Oppian, Berners, Walton, Dennys, Badham and the host of English writers who delved in the literature of early Greek, Latin and other writers, and dug up mislaid gems for the delectation of latter day anglers.

The late Thomas Westwood published a little monthly brochure called "The Angler's Note Book and Naturalist's Record," in which he embalmed all the strange happenings to anglers, as well as other things which he found in old publications. In 1884 Mr. Westwood said:

"There has been much talk of late of the scholarly angler. Where, we should like to know, is the scholarly angler's habitat? What manner of man is he? What are his ways and doings? We had an ideal of our own on the subject—the scholarly angler, we decided, must be a man of parts and learning, of course. He must be instinct with fine enthusiasms and many-sided aspirations—not an angler merely, but a naturalist, a philosopher and a 'bibliophile' as well. He must be open-eyed, stalwart-limbed, cheerful-minded—an athletic Christian, and such an Admirable Crichton as we find described for us in the 'Pleasures of Princes' and John Denny's 'Secrets.'

"With this ideal before our eyes, we set out in search of our scholarly angler—in the towns, under the trees of Academe, by the rivers that anglers love. We sought for him as pertinaciously as Diogenes sought for his honest man, and with no better result. He eluded us. Then we inquired of comers—we buttonholed some of our friends and acquaintances. Some of them smiled, some were sarcastic, all insisted that our ideal was misleading us—that we were on a wild goose chase, that if scholarly angler there were he must be of a totally different type—old and decrepit, the dust lying heavy on his erudition and in his heart, infirm of limb and feeble of vision—that, in short, he must be the man Shakespeare has described as a 'lean and slippered pantaloon, sans eyes, sans teeth, sans taste, sans everything.' * * *

"And thereupon we dropped into a dream—a dream of old days; and in this dream we came suddenly face to face with our ideal in the flesh, and his name was Charles Kingsley, the name, my readers, of a man of men. Here was our Admirable Crichton, who verily saw 'books in the running brooks,' and wrote them. Here was the athletic Christian who would rise before the lark to fish the streams of Devon with a soul as fresh as the morning—who was neither, to his last hour, old and decrepit, nor an 'Okinetos the Unmoved,' nor a pillar of salt in a Sahara of sand—who had all those fine enthusiasms and many-sided aspirations we spoke of, and who has left us his 'Chalk-stream Studies,' with many another piscatorial page that the world will not willingly let die. Is the race of Charles Kingsleys utterly extinct among us? Have we sunk so low that not a remnant is left? Methinks our paper blushes at having to record the question.

"Anglers of England! your name is legion—you throng the water-courses—your clubs and associations are past counting—are you satisfied with the mere gross, material pleasure of the sport? You have all read Izaak Walton—have you not discovered how much of good and great there is in him apart from such questions as bottom fishing and ground bait? Will you not raise yourselves to a higher level and become 'Gentlemen Anglers' in a fuller and more intellectual sense than heretofore? * * *"

This ground was so well covered by Mr. Westwood that I preferred to quote his words instead of giving his ideas in my own way. But mark what he says in a postscript: "We have cited, by name, a splendid angler, *par excellence*, but we confess we could have added severals others, had we not feared to offend their modesty. * * *"

Let me add: First among the scholarly anglers of England was the late Thomas Westwood, who wrote the above, and who, with Marston, Davies, Francis and others, formed a galaxy of English scholarly anglers. In our own land I share Westwood's fear of offending the modesty of many who may be classed under this same head, but the names of Endicott, Lanman, Prime and Hallock loom up at once, while every issue of FOREST AND STREAM seems to extend the line.

English Anglers.

While I have fished on the continent of Europe, my lines have never fallen in waters covered by the Union Jack, save in Canada, and that is too near home to count for much, but I have talked and corresponded with prominent anglers in England, and, what gives one a better knowledge of such things, I have for years read the angling journals of England.

The English angler is more gregarious than the American; and here arises the necessity of defining the term "gregarious" as applied to anglers. The English angler, as a rule, belongs to a club which has a lot of officers, and meets at stated times to have a dinner, sing songs, listen to after-dinner speeches and have a good time. In his club he meets men whom he knows, but has never fished with, but he looks around the club room and see trophies on the walls; "head of a 26lb. pike taken by Mr. ——," etc., and mentally hopes to record one some day that will go Mr. —— a pound or two better; a laudable ambition which may, or may not, according to the individual temperament, be actuated by friendly rivalry or by the meaner spirit of jealousy.

Taking up the English Fishing Gazette of May 14, 1898, I find over four columns of "Reports from Clubs," which include fifty-four clubs. As a sample I will quote a few at random, but the fact that "prizes were distributed" must be borne in mind:

Alma Angling Society, Coach and Horses, Portsmouth-place, Lincoln's-inn-fields.—On May 10 the ninth annual dinner and distribution of prizes took place. Much credit is due to Mr. Wilson for the splendid spread put on by him. Mr. Pailes, with his well-known ability, presided. After the tables were cleared several toasts were given: "The Queen," "Alma," "Prize Donors," etc. Mr. Pailes presented the prizes, to the value of £40. The chief recipients were Messrs. Hopping, Utting, Drew, Guittard, Dyer, J. Seymour, Black, Tomkinson and Hall. A good list of prizes was booked for the ensuing season. Harmony followed, and a very pleasant evening was brought to a close with "Auld Lang Syne."—J. Chambers.

Blackfriars Angling Society, Rose and Crown, Commercial-road, Lambeth.—We take our twelfth annual supper and distribution of prizes on Monday, May 23, at the above address, when all are cordially invited. I should thank all gentlemen that have promised prizes to send them on to me before the above date.—J. Foster.

Eagle Angling Society, Red Lion, High-road, Tottenham.—On May 7 Mr. J. Collier had three fine trout, scaling 5lbs. 5oz., 3lbs. 8oz., and 2lbs. respectively. On 10th inst. we had our annual general meeting, when the officers for the ensuing season were elected: Mr. E. T. Elder re-elected as president.—W. L. Price.

This shows that the English angler is more gregarious than his American cousin. They love to congregate when not fishing, have dinners at which angling songs are sometimes sung in the true Waltonian style. I doubt if any American-born angler ever heard an angling song, or could sing one if he had heard it. As in America, there are thousands of anglers in the British Isles who do not belong to clubs, but clubs are more common in England than here.

The Fly-Fishers' Club.

This London club is the only one of its kind in the world. There is nothing that approaches it in any way. It is not a fishing club, owns no waters, and does not meddle with laws nor the stocking of streams. Its objects are purely social, and it is largely composed of "scholarly anglers."*

The club is about fourteen years old, and has the elegant rooms at 10 Adelphi Terrace, Strand, which were formerly occupied by the Savage Club. The constitution and purposes of the Fly-Fishers' Club may be briefly stated to be:

To bring together gentlemen devoted to fly-fishing.

To afford a ready means of communication between those interested in the delightful art.

To provide in the reading room, in addition to the usual newspapers, periodicals, etc., catalogues and books, foreign as well as English, having reference to fishing, particularly to fly-fishing, so as to render the club a means of obtaining knowledge about new fishing places and vacancies for rods, and a medium of information on all points relating to the art.

I have before me the last annual report of the committee and of the annual dinner. Mr. William Senior, well known under the pen name of Red Spinner, is the president for 1898-9. The annual subscription for London members is two guineas, and for country members half that sum. There are 275 members, and the following items appear in the treasurer's account for 1897:

Rent for one year	$1,375
Printing, books, periodicals, etc	542
Expenses of annual dinner	185
Total expenses	$2,102

There is a balance in the bank of $1,115, which shows that the club is on a solid financial basis. The report of the dinner, at which the retiring president, Mr. R. B. Marston, presided, is given in full, except the *menu*, and the speeches must have kept the table in a roar.

The last pages of the report give the tariff in the club room and hotel dining room, for members and their guests; and it is both appetizing and cheap.

I have talked with several New York gentlemen in bygone years about forming such a club in New York. Many favored it and promised to join—if I would do all the work of organizing. Selah!

Frank Buckland.

In July, 1880, this well-known English naturalist and fishculturist met me on board a German ship at Southampton. I was returning from the International Fisheries Exposition at Berlin, too ill to go ashore, and Buckland came to see me. He was a very popular writer who put scientific facts in a way that they could be read, but he was superficial, tried to cover too much ground and never made the mark in the scientific world that his father, the Rev. William Buckland, did.

Buckland had a grudge against me. Two years before I had taken some quinnat salmon eggs to Germany by order of Prof. Spencer F. Baird, the U. S. Fish Commissioner, and my instructions were to leave a package of 50,000 for Buckland at Southampton, if he met them at the ship on my cablegram, otherwise to take them to Germany and leave them. I obeyed orders, and as Mr. Buckland did not appear at Southampton, the eggs went to Germany. He cabled me at Bremerhaven to return the eggs, but I had no authority to do it, and that was the cause of the grievance. Under other circumstances I might have liked Buckland, but on this occasion his tone and bearing did not strike my fancy. After my explanation he said:

"I had hoped to get these eggs, and had telegraphed to Seth Green for them, and he answered that they were on the way; I don't understand it."

"Mr. Green," I replied, "sent your request to Prof. Baird, and he ordered me to bring you a lot to be left at Southampton, provided you met them, or had an agent to receive them; otherwise they were to go to Germany."

"Well, but, Seth Green"—

"Has nothing to do with the case. The eggs were sent by Prof. Baird, and my orders came from him."

"But," said Mr. Buckland, "as Green is at the head of fishcultural affairs in America, I don't understand the case; he told me that you would deliver the eggs to me. Who is this man Baird?"

I was reclining on a lounge, but this question brought me up and I said: "Mr. Green is merely the superintendent of a hatching station of the State of New York; a man whose intense egotism has caused him to work the newspapers to blow him off as far as he can work them; Prof. Baird is the secretary of the Smithsonian Institution and the Commissioner of Fisheries of the United States, and is so well known among the men of science of the present day that not to know him argues yourself unknown."

That answer angered Mr. Buckland, and he left. Doubtless he looked up Prof. Baird's record after that, but his ignorance of American fishculture was surprising in a man who had dabbled in the science in England.

Buckland was an abler man than Green, and had greater advantages in the matter of education, for Green, while he could barely read and write, possessed an original capacity in the matter of grammar and spelling. Yet Buckland and he had one thing in common, the inordinate desire for newspaper notoriety.

Buckland had been a strong man physically, but did not appear so when I saw him; he died a few months later, Dec. 19, 1880.

Thomas Satchell.

Here was a scholarly angler of the first water. Associated with Westwood in the publication of that splendid work, "Bibliotheca Piscatoria," which not only gives the title, date and place of printing of every book on fishing, angling and fishculture that they could find any record of had been published, in any language, with comments on their value, and brought up to date, the *vade mecum* of the scholarly angler.

A response to a letter, and the sending of some titles of American fishing and angling books, was the flirtation that led to acquaintance, and when I was sent to Germany in 1880, as recorded, he came over to see me. If Buckland was brusque, Satchell was his foil, for a more pleasant gentleman I never met; but embarrassment followed his assumption that I was familiar with the piscine lore of the Greeks, and I was forced to tell him that the little Latin and less Greek I had learned at school had passed into oblivion, except as it had been revived in the nomenclature of fishes, and the Ojibwa was more familiar, because later acquired.

Then we came down to plain everyday angling, and I opened all the cases of American exhibitors, and let him handle the rods, inspect the flies, lines and all that comprised our great exhibit. I put lines on reels and reels on rods, and assumed the rôle of "fish" while his severely critical eye followed the bend of the rod and noted the resistance of the reel. As I was not working for any dealer in rods, I put up trout rods of all the makers who had sent them in our care. Mr. Satchell went from one to the other, and back again, and finally said: "If I was on the jury, I would hesitate to decide which was best, but it is the best display of fine tackle that I ever saw."

The Hotel Bauer, corner Friedrich Strasse and Unter den Linden, was my camp, and I asked Mr. Satchell to a fish dinner there. Of all the things which a man may eat in Berlin, outside of game birds, fish is the most expensive diet. Of course, England has all the fishes that Germany has, and the only novelty was in the cooking, and Mr. Satchell had expressed curiosity in that line. The fried soles and the boiled salmon were in no way different from the manner in which those fishes are usually served, but, on the advice of the *chef* of Hotel Bauer, the *piece de resistance* was a 2lb. carp, boiled in beer and served with a thick, semi-sweet black sauce in which some dark beer, like Culmbacher, was said to give zest to an otherwise flavorless fish. I saw that my guest was nibbling after I had quit, and I said: "Satchell, you are trying to eat that mess out of compliment to me; you don't like it, but hesitate to say so. Drop your fork and we will have the next course." The kellner removed the fish almost intact.

When the squabs and the Burgundy came on my friend's eyes brightened, for he knew that the worst, if not the *wurst*, was over, and amid the coffee and cigars he asked: "Are you fond of carp served in that manner?"

"Never struck it before, and am not in a hurry to run up against it again; the *chef* recommended it, and I was curious, as you were. No doubt a man can acquire a taste for carp in beer, as he acquires other tastes, but I am content with the experiment."

"Will you believe," queried Mr. Satchell, "that after I had landed at Bremerhaven and walked over to Geestemünde to see the fishing boats from the North Sea come in, and saw fine live cod, and bought a small one, that I could not find a café in the place where they could broil me a cod steak?"

"I would be surprised if they could. The Germans fry steaks and chops, and in the whole land there are not a thousand grills, or gridirons, as we Yankees call them. Some time I'll tell you how Prof. Goode and I tried to have an American shad broiled in Berlin, but it's a long story."

Mr. Satchell met me again at the ship at Southampton, and if I would only stop a fortnight, or even a week, he would show me [illegible] ish trout streams, and all the grills that I cared to have brought into our service. I reflected: The savage man does what he wishes to do, and is the only free and independent man. If I were a savage I would spend months on English angling waters, if my host would stand it, but there was a demand for my services some 3,000 miles across a damp spot called "Atlantic," and on this occasion my visit to Albion was limited by the stay of the ship.

American Anglers.

The American angler is not gregarious, that is, not in his angling character. Individually he may be an enthusiastic member of some secret order; or may belong to the Fat Men's Club, the Hoboken Turtle Club, the Thirteen Club, or any other organization except a social club. Not that many anglers do not belong to clubs and pay their dues promptly, but that ends it. Their interest in a club is usually to get fishing in protected waters, and in a club of several hundred the angler has a few friends who arrange to fish when he does, and he does not know many other members.

In order to make this statement specific, let me instance the case of a New York city man who is a member of the Restigouche Salmon Club, of Canada. He fishes every year, takes a friend or two, and with his Indian guides spends some time on the river, sends his salmon to the club to be packed for friends, and goes home. I have mentioned this angler's name to many members of the club who live in New York city, they "have heard the name, but do not remember meeting him."

The American angler, if not solitary, rushes off with a friend, time-table in hand, and fishes with one eye on his rod and the other on the time-table, and gets back on schedule time. He may, if he is in the railroad car and sees an angler with rod and creel, approach him and enter into conversation in order to learn of new grounds, or what lines are successful there, but he is not "gregarious" in the sense that means "brotherly."

Of course, I am speaking in a general way, for I know a club or two which have fishing privileges, and in the winter have a dinner in the city, when there is a genuine angler's greeting and a good time; it has been my good fortune to be a guest on several of these occasions, but their rarity only emphasizes the fact which I have stated. The exception proves the rule. After many attempts the officers of the defunct Rod and Reel Association managed to have a dinner follow the tournament, and a jolly affair it was, but the attendance was small, most of the members had some reason for hurrying off at sundown, but then that association was not properly organized.

America has no Fly-Fishers' Club.

America has no such institution as the Fly-Fishers' Club, of London, yet it has plenty of material for it in several great cities. A city club where meetings would be held in the winter months, a great angling library, an annual dinner, and an occasional smoking concert. In such a club friendships would be cemented, new waters would be discussed, and summer trips planned. There would be no question of children and servants occupying choice rooms at the fishing grounds, and all complaints regarding the cuisine and service would be made to the house committee, who would straighten out all kinks.

Once I broached this subject to half a dozen "scholarly anglers" and they approved the scheme, but killed it at once by suggesting that I go to work and organize such a club. As this would have been a large contract for a man who had both time and money to spend on it, the scheme went no further. I said that if each of the six would get five eligible men for charter members, I would do the same, and we would make a modest start, but that was more than they were willing to do. Those same men would toil all day under a June sun with feet in cold water for what sport could be got from a score of trout, and were also jolly, companionable men who heartily approved of my scheme, but had not interest enough in it to get a few charter members.

We all accept the axiom that "it is not all of fishing to fish," but somehow interpret that saying to mean that there are other pleasures on the stream, such as scenery, the fauna and flora, and the bull which drives the angler over the fence. But all these things the angler finds only in the few angling months. How about the winter? The intelligent and "scholarly" British angler has provided for this. He cannot angle in winter, but he does not forget that he is an angler. His fishing waters may be in any portion of the United Kingdom, and he may never fish with any member of "The Fly-Fishers' Club," but he is "a brother of the angle," and enjoys companionship with those who have been voted to be eligible, and he loves to attend the meetings and take part in the discussions, or to withdraw into a corner and discuss the tying of flies with a crony or two.

The average American angler is not convivial, and by this I mean that he lacks that element, so pronounced in the Germans, of cordial goodfellowship, and of what the French call *cameraderie*. Outside of angling the American has hundreds of social clubs, but in all our land there is no great angling club, which gathers in anglers because they are anglers, and does not ask them where they fish, nor try to influence legislation. There are plenty of organizations which are formed to regulate the laws and to fight the battles of game protection. Their existence is one of continual warfare, and they may be trusted to carry it on. I would like to see an angler's club organized which would accept and obey all the laws, absurd or wise, and when the fishing season was over resort to the library of the club, or at least attend its dinners and listen to the fishing stories, duly attested by a responsible notary public, without comment; a club largely composed of "scholarly anglers," and there are enough of them to form such a club. They are men who fish and read, but seldom write, but whose minds are stored with both ancient and modern piscine lore.

If I am right in the statements herein made, and there are really and truly enough scholarly anglers to form such a club in New York, on the lines of the London club, then by all means let such a club be formed. Fifty gentlemen anglers as charter members would start a club that within a year would number as many as the London club, 275, and by carefully guarding the mem-

* I could never resist using this phrase in this connection, for, with several other Americans—Cheney, Harris, Henshall, Poey and Wells—I am on the list of honorary members. The fly goes round with the wheel.

bership might exceed that number and become one of the most popular of clubs, where the angler could always find a congenial companion, either in human or book form, and where he would meet congenial companions, which, after all, is the essence not only of club life, but of life itself.

A Water Pollution Nuisance.

THE residents of New Jersey in the vicinity of the polluted Arthur Kill, on Staten Island Sound, have petitioned the New Jersey Fish Commission for relief:

Gentlemen: We, the undersigned, have to bring to your attention the fact that an intolerable nuisance exists at present on the shore of that part of Staten Island Sound known as the Arthur Kill. This nuisance is destructive, in the highest degree, of the fish and crustacea which come into these waters; it has made crabs and fish caught there unfit for food and detrimental to health; and it is ruining what was for many years one of the famous waterways of the State.

This nuisance is being created by the Liebig Manufacturing Company, a concern which operates works on the shore in Carteret, New Jersey. This concern uses phosphates and permits refuse to run into the waterways in clear violation of the law. The result of this illegal practice is that the water is often tainted to so great a degree that it is foul and nauseating to those who navigate it either for business or pleasure.

We therefore petition you to cause such action by your officers intrusted with the duty as will cause this great, harmful and deadly nuisance to cease and determine.

Commenting on this, Protector Shriner writes: "This is not the first time that attention has been called to this matter, but the fish and game laws do not provide any remedy. The petitioners are mistaken in their statement that the law is being violated. There are several laws on the statute books prohibiting the pollution of water. The most important is a statute making it a misdemeanor to pollute any stream used for a water supply for any municipality; this law does not apply in the present case, and if it did it would not be within the purview of the duties of fish and game wardens to enforce it. There are two laws among the fish and game enactments which prohibit pollution of waters. One applies only to certain waters of Staten Island Sound; it prohibits the refuse from fish guano factories from being discharged into the sound. Investigation shows that the Liebig company uses no fish, but that it manufactures its fertilizers from rock. The general fish and game act prohibits the discharge into the waters of the State of any deleterious or poisonous matter in quantities sufficient to interfere with the habits of fish, but this same law defines that waters of the State shall be all waters where the tide does not ebb and flow. Consequently this law is not applicable in the present case. I am convinced from interviews had with officers of the Liebig Company that they have done everything possible to reduce to a minimum the objectionable features of their industries, and they have assured me that they are willing to listen to any reasonable suggestion and to carry it out. They have established a large industry and employ several hundred hands. Whether the damage they do to fish is not more than counterbalanced by the benefit accruing to the State by the establishment of a large industry is a matter which the Legislature may be called upon to determine, as I have been given to understand that the next Legislature will be petitioned to pass an act prohibiting all pollution of the waters of the sound.

CHICAGO AND THE WEST.

Improving.

CHICAGO, Ill., Aug. 13.—From now on fishing should be improving, as the worst of the angling season usually ends with us about the middle or close of August. Word from the Kabekona Camp, Minnesota, says the 'lunge are again beginning operations to some extent. On Aug. 4 Mr. Scott Bentley caught a 21lb. muscallunge in Baby Lake, and two days later, in the same lake, Mr. Nick Young, of Burlington, Iowa, caught another, also weighing 21lbs. On Aug. 5 Messrs. Wm. G. Newby, of Ft. Worth, Texas, and R. H. Foat, of Weatherford, Texas, caught eight bass weighing 26lbs., and one bass that weighed 6lbs. Mr. H. G. McCartney, of Chicago, owner of Kabekona Camp, with Mrs. McCartney, start to-morrow evening for a stay of some weeks there. Mr. and Mrs. W. P. Mussey are at present making their second visit of the season at that point. Mr. Mussey's health is poor, and he may not return before September.

Casting Records Again Broken.

Last week, at the club contest of the Fly-Casting Club of San Francisco, Mr. W. D. Mansfield cast 130ft. 6in., and Mr. H. C. Golcher 115ft. Mr. Golcher is credited with 130ft. on more than one earlier occasion. This is out-of-door casting, and it is apparently about the limit of single hand rod work.

Can't Ship Trout out of Michigan.

Mr. John Libby, of Greenwood, Mich., got together a nice lot of brook trout, which he shipped to the Palmer House, a hotel in Chicago. Mr. Libby had heard of the Paris Exposition in 1900, and he wanted to go, so he needed the money. The fish wardens seized his trout and shattered his plans for the exposition. Jury trial, at Cadillac; $10 and costs.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Boston Fishermen.

BOSTON, Aug. 12.—The fishing parties are not all over, though it is late in the season. Mr. W. Jones, wife and children, with Dr. Webber, wife and family, have gone to Camp Leatherstocking, Richardson Lake, Maine, for two or three weeks' fishing and camping. They are the guests of Mr. N. G. Manson, owner of Camp Leatherstocking, who is to join them on Monday. They do not expect great fishing, but Mr. Manson and his head man, Oscar W. Cutting, are seldom without a fine mess of trout when they are wanted. Nights and mornings, on the right locations, are almost always rewarded with a few good rises, even in midsummer, in that location. Mr. Manson will doubtless remain for the first of the hunting season at least.

Bass and pickerel fishing parties are still in order, but the extremely wet weather has deferred several camping parties. A number of students had Lake Maranacook in mind for a camping party this week, but the rain every day has put it off for another week. Mr. Frank N. Ganong, of the Boston Herald business corps, with Mrs. Ganong, Mr. and Mrs. Mortimer Fawcett, and Mr. and Mrs. George N. Richards, all of Boston, are off to-morrow for Win Pope's camp, Emery's Grove, Lake Cobbosseecontee, Me. They will stay for a couple of weeks, camping and fishing. They expect to be well settled in camp on Sunday, Aug. 14. Great bass fishing is expected. Mr. and Mrs. C. L. Ellsworth have returned from a couple of weeks' outing on the ponds of Winthrop and Monmouth, Me. They report good bass fishing, though the fish generally run small. Norway Lake, Me., is giving out some good catches of pickerel and bass.

SPECIAL.

Weakfish on Trout Hooks.

ARVERNE, L. I., Aug. 13.—Weakfish have been biting freely in the bay, and some fine strings are reported. Jack Williams recently made an extraordinary catch before breakfast. He was rowed by Capt. Jencks, and used a spoon with No. 5, 0, trout hooks. He had fifteen strikes and landed fourteen weakfish. The largest weighed 8½lbs. and the smallest 4¼lbs., the total catch weighing about 100lbs. The fish were caught in the runway near the trestles of the New York and Rockaway Beach Railroad.

EXEGESIS.

Trout for New Jersey.

PROTECTOR CHAS. A. SHRINER, of Paterson, requests that applications for consignments from the 50,000 trout fingerling distribution be sent in to him at once. The distribution will be made about the middle of October.

The Kennel.

Fixtures.

Sept. 7.—Manitoba Field Trials Club trials. William C. Lee, Sec'y, Winnipeg, Man.

Sept. 12.—Northwestern Field Trials Club's Champion Stake, near Winnipeg. Thos. Johnson, Sec'y.

Nov. 1-5.—Fourth annual field trials of the Monongahela Valley Game and Fish Protective Association, Greene county, Pa. S. B. Cummings, Sec'y, Pittsburg.

Nov. 7.—Indiana Field Trials Club's trials, Bicknell, Ind. S. H. Socwell, Sec'y.

Nov. 11.—Eastern Field Trials Club's trials, Newton, N. C. S. C. Bradley, Sec'y.

Nov. 15.—International Field Trial Club's trials, Chatham, Ont. W. B. Wells, Sec'y.

Nov. 15-17.—Central Beagle Club's annual trials. L. O. Seidel, Sec'y.

Dec. 5-6.—Missouri Valley Field Trial Club's trials. C. H. Werner, Sec'y.

Dec. 5.—Continental Field Trial Club's trials, Lexington, N. C. W. B. Meares, Sec'y.

Manitoba Field Trial Matters.

THE subjoined clipping from the Free Press shows a most pleasing improvement in Northwest field trial matters. It treats of the matter as follows:

"The interest in field trials now displayed by the general public is most gratifying to the different clubs of the Province. Possibly never before have the entries for the different events in September been as large. A glance over the list published recently by the Free Press of the Manitoba club tells the tale of how local fanciers are awakening to the fact that they can produce as good and as successful stock as their neighbors across the line, their entries this time far outnumbering those of the latter. True, the Americans have shown indomitable pluck in coming so many hundred miles the past years to do battle with the pick of Manitoba dogs, but have often too proved the victors. However, Manitoba dogs have been steadily improving and without doubt this year a different tale will be told, last year the championship only being wrested from us after a hard fight. Sept. 5 (Labor Day) the Western Canada Kennel Club start their third annual amateur trials, and from present indications it promises to surpass its predecessors. Their trials are strictly amateur, competing dogs having to be owned and handled by amateurs solely. Wednesday, Sept. 7, begins the Manitoba club's twelfth annual international trials, extending the balance of the week. American handlers now have their charges in active training at different points in the Province, Manitoba handlers being located nearer Winnipeg, where the birds are reported just as plentiful as in the outlying districts. As a fitting finale the Northwestern Club will hold the competition for the handsome championship cup, now on exhibition in Messrs. Robinson & Co.'s store window, in as close proximity to Winnipeg as the sufficiency of the necessary game will allow, thus giving the citizens an opportunity of witnessing how this grand sport is conducted. As only first and second prize dogs of the continent are allowed to compete, the merit of competitors should be of a very high order."

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Rifle Range and Gallery.

Cincinnati Rifle Association.

THE following scores were made Aug. 7 by members of the Cincinnati Rifle Association. Conditions, 200yds., any rifle, at the German ring target. Strickmeier was declared king with a score of 224. He also wins the Uckotter trophy with the same score. Hasenzahl was high on the honor target with a score of 67. Weather warm, and a 3 to 5 o'clock gusty wind:

King scores:

"Resting on his Laurels."

UNDER the above heading the Sussex Daily News, England, has the following to say of Mr. Walter Winans:

"Bisley this year misses, for the second year in succession, the presence in active competition of the most remarkable competitor of the whole 2,000 now present. Last year the death of his father kept Mr. Walter Winans from appearing in the revolver matches and the running man and running deer sporting rifle contests, while at the present meeting he is resting on his laurels, though daily driving over from his summer home in Surrey, behind the fine black animal which, harnessed to an American buggy, is so much admired in and around Brighton. At Bisley Mr. W. Winans gains distinction in a manner which would be miraculous in the case of a Service rifle marksman; that is to say, he maintains his supremacy year after year with the revolver. Although he has fired a few rounds with six-shooters, he is not competing, and while other revolver shots may not be displeased at his temporary retirement, the loss in entrance fees will be considerable to the Association. Trotting and driving contests are chiefly occupying Mr. Winans' attention this summer, and he contemplated appearing at the forthcoming agricultural show at Brighton had the rules allowed the use of the buggy vehicle."

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter-century.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

Aug. 17-18.—Waterville, Me.—Tournament of the Interstate Association, under the auspices of the Waterville Gun Club. E. T. Wyman, Sec'y.

Aug. 17-18.—Warsaw, Ind.—Lake City Gun Club's tournament. J. S. Campfield, Sec'y.

Aug. 17-18.—Canton, Ill.—Nineteenth annual tournament of the Canton Gun Club. J. C. Thompson, Jr., Sec'y.

Aug. 23.—Lyndhurst, N. J.—Live-bird handicap, 25 birds, $10. T. W. Morfey, Sec'y.

Aug. 23-26.—Detroit, Mich.—Tournament of Michigan Trap-Shooters' League. W. H. Brady, Sec'y.

Aug. 24.—Warwick, N. Y.—Special shoot, Hudson River Trap-Shooters' League, on grounds of Warwick Gun Club. J. B. Rogers, Manager.

Aug. 24-25.—Minneapolis, Minn.—Tournament of the Minneapolis Gun Club. G. J. McGraw, Sec'y.

Aug. 25.—Bristol, Conn.—Fourth annual tournament of the Connecticut State League. H. J. Mills, Pres.

Aug. 25-26.—Mt. Kisco, N. Y.—Tenth annual target tournament of the Mount Kisco Rod and Gun Club. F. E. Wood, Sec'y.

Aug. 27.—Hingham, Mass.—Hingham Gun Club's one-day tournament.

Aug. 27.—Philadelphia.—Philadelphia Trap-Shooters' League, on grounds of Silver Lake Gun Club, Point House Road. J. O. Schutz, Sec'y.

Aug. 29-31.—Union City, Oklahoma.—Union City Gun Club's tournament. F. M. Johnson, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication n hese columns, also any news notes they may care to have printed. Tiee in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

Mr. John M. Lilly, secretary of the Limited Gun Club, of Indianapolis, Ind., made a pleasant call in FOREST AND STREAM office on Tuesday of this week. He was homeward bound on that day. He reports trap matters somewhat dull at present, as is to be expected at this season of the year, but the forthcoming winter tournament of the Limited Gun Club is expected to be very successful.

Mr. Platt Adams used some of the Laflin & Rand new smokeless powder at the Brooklyn Gun Club's shoot last Saturday, and expressed himself as being delighted with it, both for its absence of smoke and thoroughly good execution. He also has discovered a remedy which has counteracted his flinching, which he has promised to reveal to the readers of FOREST AND STREAM in the near future.

Mr. M. F. Lindsley, of the King Smokeless Powder Co., is one of the hardest-worked men in the powder business at present, though the other ballistic experts are by no means idle. Neither Mr. Lindsley nor Mrs. Lindsley (Wanda) have been shooting much this year, though we learn that Mrs. Lindsley intends to begin practice in earnest in the near future.

A very closely contested match was that between Messrs. Heikes and Gilbert, at Watson's Park, Chicago, last Saturday. No conditions could more thoroughly try out the skill of the contestants than those at 50 unknown, 50 expert and 25 pairs. Heikes won by a margin of 3 targets, 140 to 137. The whole story is told in realistic detail by Mr. Hough in "Western Traps."

Mr. J. O. Schutz, secretary of the Silver Lake Gun Club, Philadelphia, writes us that the programme of the next shoot of the Philadelphia Trap-Shooters' League, fixed to take place Aug. 27, under the auspices of the Silver Lake Gun Club, are ready for distribution and can be obtained of him. The grounds of the club are on the Point House road, Pennsylvania R. R. Coaches from Second and Mifflen streets.

Nearly every writer would be tempted to call attention to the wide circulation of his journal if he received communications from foreign countries, but we are so accustomed to such things in this office that we accept them as a matter of course. The following is from a correspondent who dates his communication June 21, at Penhalonga, Rhodesia, South Africa: "The issue of FOREST AND STREAM dated May 7 has just been received, and I notice under the head of 'Drivers and Twisters,' page 377, first article, a call for some remedy for flinching, or 'fudging,' as the sudden shrinking at the moment of firing is called. Perhaps the following plan, modified to suit, would prove effective in shotgun shooting, as it is in rifle shooting at targets. An old Wimbledon man has given it to me as the plan he used in training his Irish team for competitions, and his team was successful in their tours: In every packet of ten rounds of ammunition were put three dummies, and these packets were served out on practice days. The dummies were made by first extracting the bullet, and the powder was then removed and treated with a solution of saltpeter to destroy its explosive power, the powder was replaced and the bullet refitted and the dummy put in the packet. No one could then tell a dummy from a good round until the trigger was pulled. The advantages are many over the sighting drill. The most prominent being that the shooter was prepared for the recoil concussion, and shrunk, shut his eyes, etc., etc., with the dummy as with the real, and could then see what error he made, and knowing his error the correcting could follow. If this will serve to help any of my fellow shooters of the rifle or brethren of the shotgun I will be greatly pleased."

Jack Fanning's score of 98 out of 100, made at Centredale, R. I., Aug. 9, is pretty near to getting them all. Gold Dust, with Jack Fanning's eye to guide it, is doing great things at the traps of late. Since the Meriden shoot Jack has been moving about lively and shooting industriously. His first shooting thereafter was on the grounds of the Providence Gun Club, at Olneyville, R. I., where he scored 90 out of 100 notwithstanding that the day was very windy. Next at the Pascoag Gun Club's grounds he scored 96 out of 100. After breaking 98 out of 100 before an enthusiastic audience of ladies and gentlemen at Centredale, as above mentioned, he scored 96 out of 100 on the grounds of the Pawtuxet Gun Club, Aug. 13. After the single target events, Fanning gave an exhibition of double target shooting, which pleased the shooters and spectators greatly. Fanning's work has added a new impetus to trap-shooting in the places where he visited. He will be in attendance at the Interstate at Waterville, Me.

Mr. Carl von Lengerke has devised a new system of shooting to try out to the utmost the skill of those who believe that they are thoroughly good shots, whether the belief is founded on fancy or fact. His system requires that two sets of traps be placed before the shooter, one set of five being for targets, expert system; the other being a set of five traps for live birds. The shooter standing at the score does not know whether he is to shoot at a target or live bird until the trap is pulled, when he must shoot at whichever is offered. The shooter has an equal number of targets and live birds, but as they necessarily do not come alternately he is never certain before the trap is pulled which he will have to shoot at. Any one who feels that he would like to try a match after the manner of this system will hear something to his advantage by challenging Mr. Carl von Lengerke, care Von Lengerke & Detmold, 318 Broadway, New York.

The programme of the Interstate Association's trap-shooting tournament, given for the Haverhill Gun Club, Haverhill, Mass., Sept. 7 and 8, can be obtained of the club's secretary, Mr. Geo. F. Stevens, P. O. Box 245, Haverhill, Mass. Guns and ammunition forwarded to Mr. Chas. A. Griggs, No. 8 Main street, will be delivered at the shooting grounds free of charge. A first-class lunch will be served each day at a reasonable price. Shooters may enter for the price of targets, 2 cents, in any of the events. To reach the shooting grounds take the Main street electric cars to Dustin Square. The headquarters for the sportsmen during the tournament will be the Eagle House and Hotel Thorndike, each $2 per day. There are ten events on the programme for each day—six at 15 targets, entrance $1.50; four at 20 targets, $2 entrance.

Mr. C. C. Beveridge, known to his shooting friends by the endearing sobriquet "the Dominie," has not been heard of for many weeks, till recently a letter from him informs his friends that he is in Pittsburg, Pa., which city has so much smoke that it is difficult to see the targets clearly within any reasonable distance of its suburbs. The Dominie says that if his watch holds out as a good timepiece, he will arrive in New York on Nov. 10, and thereat we all rejoice.

Programmes of the Worcester Sportsmen's Club Labor Day shoot, Sept. 5, can be obtained of the secretary, Mr. A. W. Walls, 6 Woodbine street, Worcester, Mass. Guns and ammunition sent in care of Mr. A. B. F. Kinney, 44 Front street, will be delivered at the grounds free. All purses will be divided 40, 30, 20 and 10 per cent. The programme has 150 targets at a total of $11 entrance for the day. Shooting commences at 9 o'clock. Dinner will be served on the grounds.

Mr. R. E. Rust, in a communication dated Aug. 11, writes us that "The Eau Claire Gun Club has arranged for the match between Rolla Heikes and Fred Gilbert for the iron medal, to take place here at their park on Aug. 27. The match to be at 100 live birds each." We are further informed that there will be sweepstake events also.

Mr. W. L. Gardiner, of San Antonio, Texas, has been shooting in the East recently. At Ocean City he was among the leaders in the race for highest average. At the Brooklyn Gun Club last Saturday he made some excellent scores, notwithstanding that he was shooting an entirely new gun, a Greener, most of the time.

A Labor Day shoot will be held by the Schenectady Gun Club, Schenectady, N. Y., Sept. 5. Shooting commences at 10 o'clock sharp. There are twelve events of 15 targets each, entrance $1.25. Targets 25 cents for fifteen. Money divided 30, 25, 20, 15 and 10 per cent. Take cars for Belleview.

Mr. Justus von Lengerke, of the firm of Von Lengerke & Detmold, returned last week from a trip to Europe, where he spent some weeks. He looks hale and hearty, as if the climate, water and eatables abroad agreed with him perfectly.

The Forester Gun Club will give a merchandise handicap shoot on Sept. 5. All professionals will be barred from merchandise or money events. The captain, Mr. John Fleming, 59 Milford avenue, Newark, N. J., informs us that programmes can be obtained of him.

At the fourth attempt the Sherbrooke Gun Club, of Sherbrooke, Province of Quebec, succeeded in winning the Provincial League trophy, on Aug. 11, from Montreal. The signs indicate that there will be a return match for it again soon.

At Fort Smith, Ark., on Aug. 12, Mr. Joe Matthews defeated Mr. J. J. Sumpter, Jr., of Hot Springs, Ark., for the State individual medal, by a score of 42 to 41, at 50 singles, unknown angles.

Mr. Harry J. Sternberg, secretary of the Rain Makers' Gun Club, Corning, N. Y., writes us that his club will give its first Labor Day shoot in Corning on Sept. 5, at targets, in East Side Park.

The Mount Penn Gun Club's tournament, Sept. 5 and 6, promises to be an extraordinary success, twenty-five or more clubs having signified their intention to participate.

On Saturday of this week, at Elkwood Park, the Pennsylvania Club cup is the main event; handicaps, 25 to 30yds., $25 entrance, cup and 40 per cent. to the winner.

The Pawling Rod and Gun Club, Pawling, N. Y., will hold an all-day shoot at targets on Labor Day, Sept. 5.

Ocean City Midsummer Tournament.

OUR shoot, Aug. 4, 5 and 6, was very nice, everyone being pleased with it. It was run off without a hitch during the three days. We expect to make it an annual, and it no doubt will increase each year. It was started last year late in the season, and had only twelve shooters. There were thirty this year. Ocean City is an ideal place to hold the shoot; those who were here no doubt will say that the arrangements were perfect. There were 7,840 targets thrown, and 530 live birds trapped. The birds were furnished by Mr. J. R. Malone, and were a rare good lot of summer birds.

All moneys in target events were divided 40, 30, 20 and 10. The amateurs stood at 14yds.; semi-experts 16yds.; experts 18yds. Targets 2 cents. Live birds 25 cents.

The target events were alike for each day: two 10-target events, $1 entrance; three 15-target events, $1.25; four 20-target events, $1.50; and one three-men team race, 25 targets, $6 per team.

THURSDAY, AUG. 4. FIRST DAY.

The ten events were shot smoothly through. Shooting commenced at 9:30. Mr. Hood Waters added a new pleasure to the event by rejoining his old friends, he having returned from Seattle. He made a good beginning, breaking 131 out of 145, an average of .903 per cent. Wagner and Hawkins were each .855, Floyd .848, Fulford, Gardner and Gent .827, Trego .811, Dr. Lupus 786.

The weather was clear, a strong wind blowing in the afternoon. Nos. 11, 12, 13 and 14 were extra events at doubles. The scores:

Events:	1	2	3	4	5	7	8	9	10	11	12	13	14

FRIDAY, AUG. 5, SECOND DAY.

There were twenty-five participants in the competition on this day. The wind was milder, and scores improved in consequence. Floyd was high average with .931; Hawkins, of Baltimore, was second with .924; Storr third, .903; Marten fourth, .833. The scores:

Events:	1	2	3	4	5	7	8	9	10	11	12	13

This day concluded the target events.

SATURDAY, AUG. 6, THIRD DAY.

In the Ocean City Handicap Messrs. Marten, Quimby and Malone made straight scores, Fulford taking second money alone on a score of 19. Events Nos. 1 and 2 were at 5 and 7 birds respectively, $5 and $7 entrance, high guns, birds included. All stood at 30yds.; No. 3 was the Ocean City Handicap, 20 birds, $15 entrance, class shooting, moneys divided 50, 30 and 20 per cent., birds extra, handicaps 24 to 32yds.:

The Sherbrooke Gun Club.

SHERBROOKE, P. Q., Aug. 6.—A match for the Province of Quebec championship cup was shot between J. B. Goodhue and T. M. Craig, at Stanstead, Quebec, on Aug. 6, resulting in a win for Craig. Scores were:

Craig.

Known angles	1111011011111111110101—16
Unknown angles	1101110111001111111—16
Pairs	11 10 01 11 11— 8—40

Goodhue.

Known angles	0011101100111010111—13
Unknown angles	1110011110111111111—17
Pairs	10 11 10 10 11— 7—37

The cup was instituted at Sherbrooke's annual of 1897. Winner to defend it successfully five times before owning it. Craig won it then, and afterward defeated Walton, Thompson and Goodhue, losing it to W. L. Cameron, of Montreal, at Sherbrooke's annual this year. Goodhue went to Montreal and got it, and has since defeated Eaton, of Montreal, and Thompson, of Sherbrooke, losing it to Craig, as above. Craig now has three defenses to his credit and Goodhue two, and it looks as though the struggle would be between those two. They were to try it again at Sherbrooke on the 13th, the event adding much to the interest of the club's usual fortnightly badge shoot.

C. H. Foss, Sec'y.

Sherbrooke won the Provincial League trophy from Montreal on Thursday, Aug. 11. It was their fourth attempt to get it since Montreal won it on Dominion Day, 1896, at Sherbrooke's annual. The day was fine for shooting, and at the preliminary sweeps, which were shot just previous to the match, nearly everybody appeared to be in pretty good form; but, as the scores show, when the match was on one or two dropped, as somebody or other most always does. Montreal does not intend to let Sherbrooke's guns get very cold though, for they are coming right out after the cup, and it will probably be up again in September.

After the shoot was over Montreal entertained Sherbrooke at dinner at the Balmoral Hotel. Shooting is a good appetizer, and the excellent menu was thoroughly appreciated. Below are the scores:

Conditions: 20 targets, known angles:

Montreal.

C Aubin	1111101101011101110—15
R B Hutcheson	1111111101110110101—16
D W Caudlish	1100000110000101010— 8
E C Eaton	0001111001011110111—12
W L Cameron	0111011111011101111—16—67

Sherbrooke.

C G Thompson	1111101111101111111101—17
T M Craig	1011111111101001001O—13
J B Goodhue	0111111111001111011111—16
J G Walton	0111001110101111101—14
N G Bray	1101011101111101111111—16—76

Capt. Thompson, of the Sherbrookes, felt very much elated over the victory, and on the way home couldn't keep his hands off the other members of the team. Craig downed him in a scuffle which followed one of his pranks though, and the featherweight from Rock Island went through his pockets and relieved him of what little he had won in the sweeps and divided it with one of the others. Thompson claimed to have lost $1.75, but there's no evidence to show that he had over 65 cents when he left Montreal, and nobody's going to do anything about it.

Now the boys are talking about trying to get the trophy held by Montreal for 15 targets, unknown traps, gun below the armpit, but they've got to practice some, for in a friendly race on those conditions Thursday Montreal beat them by 10 birds.

Marlborough Tournament.

THE tournament of the Hudson River Trap-Shooters' League, on the grounds of the Marlborough Gun Club, Marlborough, N. Y., was a very pleasant and successful gathering of shooters. Ogden and Dain tied for high average. Halstead was second; Von der Bosch third; Mason fourth; E. Hill fifth. Von der Bosch won the King Smokeless Powder trophy.

There were only two teams present, that of the home club and the Peekskill Gun Club. A protest was entered against Van der Bosch as a team contestant, on the ground that he was not a member long enough to qualify according to Rule 11 of the by-laws, which requires that each member of a team shall have been a bona fide member of his club at least six months prior to the first annual tournament of the league.

There were manufacturers' agents present. The scores:

Events:	1	2	3	4	5	6	7	8	9	10

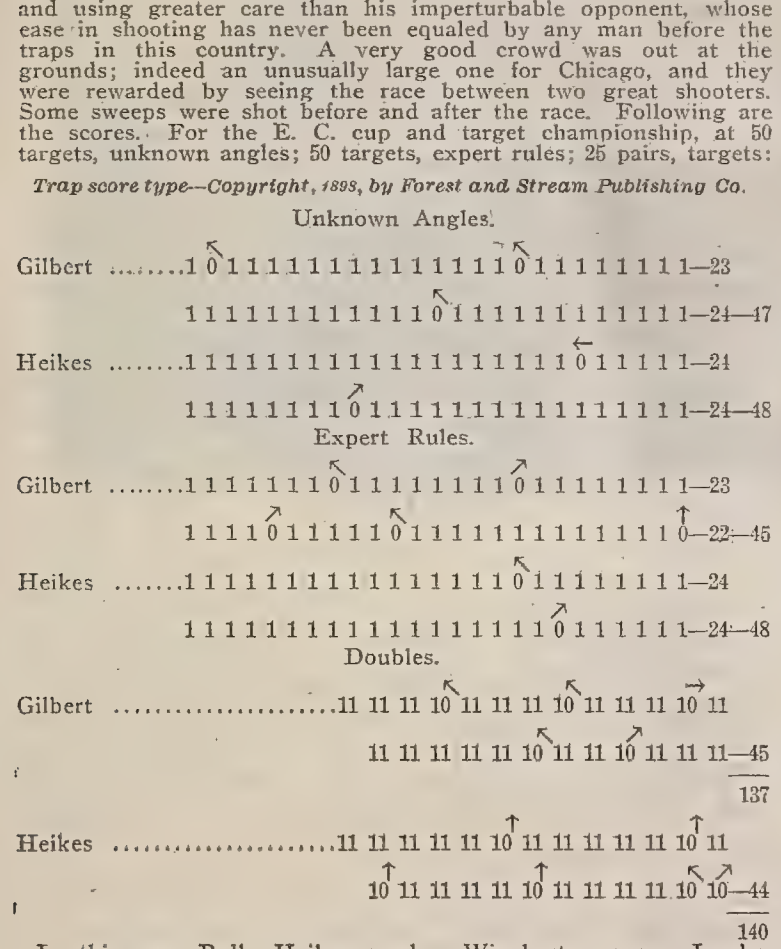
The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

WESTERN TRAPS.

HEIKES WINS BACK THE E. C. CUP.

CHICAGO, Ill., Aug. 13.—Rolla Heikes, the Daddy of them All, to-day defeated Fred Gilbert and won back the E. C. cup, which once he took from Gilbert, and which the latter took from him at Dayton. Score to-day, 140 to 137.

Earlier in the week both men met more than once in practice at Watson's Park, and the results of those days were carefully watched by the knowing. Heikes has been loafing and fishing, and privately said to a friend that he was as fit as he ever was in his life, and was going to make a good race. On last Wednesday he shot through the conditions of this race at the park in practice, but evidently did not try at a stage in the game, for he only scored 132. Gilbert, on the other hand, was doing great work in practice. He once ran 121 out of 125 of the match rules targets, and one day broke 15 pairs straight, following that on the next day with 25 pairs straight, or in all 40 pairs or 80 birds, broken straight. His friends thought him a cinch.



On Thursday a few of us were out at the park to see Heikes and Gilbert warm up a bit again. Dr. Shaw, of Chicago, and Mr. Henry Lyons, of Louisville, Ky. (who won the State championship of his State this year, and who is now visiting at Chicago and shooting a little at Watson's Park), shot in with the two cracks through the conditions of the E. C. cup race, 50 unknown angles, 50 expert rules, 25 pairs. Dr. Shaw scored in the above sets 45, 38, 40, total 123. Mr. Lyons scored 43 unknown angles and 32 expert rules, withdrawing. Gilbert was on that day evidently not up to the form of the day previous. At the known angles he scored 47, at the expert rules 43, and in the doubles 44, or a total of 134. Upon the other hand the Daddy of them All was never in better shape, and seemed bound to break Fred's heart right then and there. He ran his 50 unknown angles without a skip or a miss, and at the expert rules he did the same thing over again, 50 straight, breaking well over 100 targets as though in a trance. In the doubles he lost 4 birds, but went out smiling with 146 broken out of 150. Those who knew of this performance could not see how such a man could be defeated, for this score, albeit made in practice, was authentic, and was the highest ever reached on these mixed championship rules at targets.

To-day it is possible Gilbert was popular choice to win, among those who had not heard of Heikes' performance of Thursday, and who remembered the Iowa boy's long run of live-bird victories. Indeed he shot a magnificent race, and his score is a superb one for any shooter. He broke 47 in the unknown angles, 45 at the expert rules, and 45 in the doubles, 137 in all. Heikes led him 1 bird in the unknown angles, and 3 birds in the expert rules, going into the doubles almost a certain winner, with 4 birds to the good, though Gilbert's chances were thought best in the doubles. The latter picked up one bird on the Dayton man in the doubles, scoring 45 to Heikes' 44, but this left the gap unclosed by 3 birds, and the cup was boxed for Dayton, O.

In the shooting of Thursday last it was observed that Gilbert's hoodoo bird was a left-quarterer, which he missed repeatedly. This was the case in the match to-day. I have indicated the flights of the targets missed by means of the FOREST AND STREAM live-bird graphic type, so that readers may see just what flights were missed. Gilbert missed 8 of these quartering birds well to the left, 4 right-quarterers and 1 straightaway. Heikes was less particular what he missed. His first lost bird was a sharp left-quarterer, almost right to left across the score. He missed 2 more left-hand birds, and 2 which quartered to the right. On four different times he missed a straightaway bird which sailed off directly to the front, but a shade lower than that bird had been averaging. Gilbert smoked his 38th bird hard, but did not crack it. He dusted his 86th bird also hard. On his 95th he got a piece, but accepted and broke it. His 99th was also a piece, and was broken. In the doubles Gilbert could not land a straight set, but always lost at least one out of his 10, giving Heikes a leeway every time he stepped to the score—for Gilbert won the toss and shot first. Heikes shot at a piece on his 63d bird, not knowing it was a piece, but it was scored to him, broken by a very faint majority. His 94th bird was smoked hard, and so in the doubles were his 12th, 23d, 28th and 38th birds. So far as could be told as between such experts, Heikes used the better and smarter time in his shooting, Gilbert as usual working hard, and using greater care than his imperturbable opponent, whose ease in shooting has never been equaled by any man before the traps in this country. A very good crowd was out at the grounds; indeed an unusually large one for Chicago, and they were rewarded by seeing the race between two great shooters. Some sweeps were shot before and after the race. Following are the scores. For the E. C. cup and target championship, at 50 targets, unknown angles; 50 targets, expert rules; 25 pairs, targets:

Trap score type—Copyright, 1898, by Forest and Stream Publishing Co.

Unknown Angles.

In this race Rolla Heikes used a Winchester pump, Leader shells and Schultze powder. Gilbert used an L. C. Smith, Leader shells, Du Pont powder. Judges were A. C. Paterson and A. W. Adams; Ike Watson referee.

Fred Gilbert will be in Chicago for a day or so yet, and so will Rolla Heikes. They will both be at Minneapolis shoot, Aug. 24-26, and on their way back from that shoot will meet at Eau Claire, Wis., Aug. 27, and shoot off at that city their race for the cast-iron badge, 100 live birds. The Eau Claire men have urged Rolla to come up to their town and show them a race, and this he has agreed to do.

MONTGOMERY WARD TROPHY.

A very notable local interest is forming about the coming contests for the Montgomery Ward & Co. live-bird handicap trophy, the initial contest for which emblem will come off at Watson's Park Wednesday next, Aug. 17. The medal is a beautiful affair and well worth winning. It will not be subject to challenge, but will be wide open every time, the one winning it the greatest number of times to take it. John Watson handicaps, and that is enough to say.

DULUTH.

About fifty shooters appeared at the tournament this week of Central Gun Club, of Duluth, Minn., and reports would show the shoot a success. The programme was liberal, and the shooters from over a large area gathered to reap the benefit thereof. Tom Graham, of Sault Ste. Marie, was in good form, and broke 142 out of 150 the first day, high average. Catamaran, of St. Paul, broke 136, and Trent, of Wadena, scored 135. Several ties on 133 showed up, and the scores were of the current high class. An ugly accident with a runaway team prevented the attendance at the grounds of Dr. Spratley, of St. Cloud, who was on his way out to the grounds when disabled.

VALLEY CITY, OF GRAND RAPIDS.

The contest for the trophy of the Valley City Gun Club, of Grand Rapids, Mich., includes three more shoots for the season. Ralph Widdicomb, the very brilliant young shot of that city, has won this trophy five times, and C. B. Kelsey three times. A. L. Holcomb has won it four times and landed it last week. Widdicomb is favorite. The trophy will be called in Aug. 26, on which date the nineteenth shoot for its possession will have been completed.

WASHINGTON PARK, OF K. C.

At the last monthly shoot of Washington Park Gun Club, of Kansas Sity, Mo., Aug. 10, Newton Beach won the club trophy with 15 straight kills alone. Score:

N Beach	112121211111111—15	J Dickinson	221112220210122—13
W S Allen	222022221222112—14	Newton	021200212111221—12

KEOKUK.

At the regular monthly shoot of the Keokuk Gun Club, Iowa, last week, Burger won the club medal for the third time, and it became his property. A fair attendance was on hand. Score: At 20 live birds: Burger 18, Ross 11, Weiler 11, Griffey 12, Thomas 12, Boquet 8, Ackerman 13, Leisy 8, Meister 14, Woodbury 13, Raber 7.

MINNEAPOLIS.

At the last weekly shoot of the Minneapolis Gun Club, Minnesota, Stokes won the senior badge, Neely amateur badge, Mrs. Parker amateur badge, Catamaran the Val Blatz badge, Hays the Paegle badge, Lawrence the Schlitz badge. About thirty present.

EMPORIA SHOOT.

The Kansas Association shoot at Emporia last week was a very nice affair. Among others on hand from out of town were Jap, of Leavenworth; Courtney, of Kansas City; Lou Erhardt, of Atchison; J. Heer, of Ottawa; Bert Bennett, of Wichita; J. R. Jones, of White City; J. H. Cox and John J. Corbett, of Kansas City; James Plumb, of Lang, and H. W. Kooler, of Leavenworth. Courtney and the tall, slim Corbett, of Kansas City, were among the top-notch winners.

COMING.

Salina, Kan., Gun Club will revive interest and begin regular shoots this week, keeping up weekly contests for the rest of the fall.

Crystal Lake Gun Club, of Urbana, Ill., will give a rattling good shoot Sept. 13-14, on the new and improved grounds. Targets only.

Eau Claire Gun Club, of Wisconsin, will have a little sweepstake for the boys Aug. 27, the day of the Heikes-Gilbert race for the cast-iron badge.

The hard shooting and pleasant young Iowa shooter, H. C. Mortensen, jocularly named on the circuit the Terrible Swede, will give a tournament this coming week at his home, Britt, Ia., Aug. 17-18. The first day will schedule ten 15-target events, repeated on the second day, and on the second day at 10 o'clock A. M. Mr. Mortensen and Dr. Kibbey, of Marshalltown, Ia., will shoot another one of their many hotly contested live-bird races at 50 live birds per man, for a silver cup and $100. Mr. Mortensen has hung up a nice lot of average money, and his programme will bring out a goodly number of shooters from among the neighboring towns, where shooters are abundant.

M. J. Breindenbend, secretary of Mt. Sterling, Ill., Gun Club, writes that the Mt. Sterling Club claims date of Oct. 12 for their third annual tournament. The programme will be an attractive one, and a good stiff attendance is anticipated.

NEW.

Baraboo Gun Club, of Baraboo, Wis., was organized last week with the following officers: M. H. Mould, President; L. M. Jacobs, Secretary; H. Schoenfeld, Treasurer. Membership of twenty-five.

Kenosha Gun Club, of Kenosha, Wis., was organized last week; officers as follows: H. E. Tanner, President; Dr. Ripley, Vice-President, and Will Yule, Captain.

LAY COMMENT.

The Grafton, N. D., Record states that the Crookston Gun Club is going to hold a "sweepsteak" shoot ere long. The Green Bay, Wis., Gazette remarks that "clay rock" birds will be used in a contest soon to be shot at that city.

HOBART NEW GROUNDS.

Hobart Gun Club, of Indiana, has arranged new grounds near the bank of Lake George, and on Aug. 9 opened them with a little shoot. There were fourteen target numbers. Among the visitors were R. Simmonetti, James Barto and John Boa, of Chicago; Andrew Lockie, of Manteno, Ill.; Geo. J. Roll, of Blue Island, and G. A. Elliott, of Rochester, Ind. The best average was made by Barto.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

EUREKA GUN CLUB.

On Aug. 13 the Eureka Gun Club, of Chicago, held its regular weekly target contest. The attendance was fairly good. Those shooting in classes B and C were high over Class A in the medal contest. A. C. Borroff most distinguished himself with a score of 24 out of a possible 25.

The sky was overcast, without a ray of sunlight, mingled with an occasional shower of rain. There was little or no wind during the contests. All events were shot from the magautrap, except No. 9, which was at 25yds. rise. The scores:

Events:	1	2	3	4	7	8	9

Dr Morton	01111111000101111010110001—15
Cunnyngham	11111111011101101010111111—20
A W Morton	11111101101111111110111011—21

Class C.

Neta	01100111001110111110111101—18
Borroff	11111111111111111111111101—24
Porter	11011111101111011011110010—18
Stanley	11111011101111101110111111—21

Following the trophy event was a team shoot of seven men per team, 25 targets per man, and was won by Morton's team:

A. C. Borroff 18, V. L. Cunnyngham 20, W. D. Stannard 22, Porter 17, Dr. Morton 18, C. C. Hess 17, F. P. Stannard 19—131.

A. W. Morton 20, Stanley 17, Doc Carson 18, Neta 18, H. Vetter 22, E. M. Steck 23, H. F. Carson 22—142.

GARFIELD GUN CLUB.

The attendance at the Garfield Gun Club's weekly contest was only fair. Many of its regulars were absent on account of the Heikes-Gilbert contest at Watson's Park, which they attended. The scores made were considered fairly good, considering the elements existing. Practice events:

Events:	1	2	3	5	6	7	8
Targets:	15	10	15	10	10	15	20
Dr Shaw	14	6	..	8	9	11	15
De Maris	11	7	..	4	7	..	..
R Kuss	14	6	15	7	..	..	..
Pollard	9	1	12	6	8	5	..
Nusley	10	4	13	6	8	2	..

Events:	1	2	3	5	6	7	8
Targets:	15	10	15	10	10	15	20

THE CHICAGO CHALLENGE TROPHY.

It was expected that an acceptance of V. L. Cunnyngham's challenge for the Chicago challenge trophy would have shown itself this week. It is learned that the wife of the holder, Thos. P. Hicks, has been seriously ill for the past two weeks, but is now on the road to recovery; hence a race can be looked for at an early date.

LELAND, ILL.

Some of our Chicago shooters were entertained at Mount Pleasant Villa by our worthy fellow sportsman and shooter J. H. Amberg. Some few days' outing was made most pleasant by the host. Target and rifle shooting were freely indulged in by Dr. J. B. Murphy and family, A. L. Smith, J. H. Amberg and family, Capt. J. Bourke, M. Clapsaddle, A. C. Paterson and several others. The targets were thrown from one trap, unknown angles, each taking turns in trapping, and giving room for the trapper to make the game difficult. Messrs. Amberg and Clapsaddle did the best of the shooting during the first day, Amberg tieing with Paterson on the second day. Mount Pleasant Villa is the summer home of Mr. Amberg, and he delights in entertaining his friends on the farm during his stay there. The house contains twenty sleeping rooms, with additions consisting of dining room, kitchen, laundry, store room and ice box of large capacity. A bountiful supply of provisions and other things were on hand for the entertainment of the guests, and it is needless to say that all were well provided for, and the time spent was most enjoyable.

A. C. PATERSON.

ON LONG ISLAND.

BROOKLYN GUN CLUB.

Brooklyn, L. I., Aug. 13.—The bargain day shoot of the Brooklyn Gun Club, held to-day, was a pronounced success. John Wright was in one of his happiest moods, and if it could have been done within the limits of good arithmetic, he would have been pleased to have given all the shooters double handicaps and prizes. The novelty of the programme entitles it to a reproduction.

Mr. Patterson acted as cashier, while John Wright fingered the electric trap pulls with the grace and precision of a Paderewski.

Mr. W. L. Gardiner, of San Antonio, Texas, who is spending the summer in the North, participated in the shoot, and was a pretty warm visitor, as a reference to his scores will show.

Mr. B. Amend defeated Waters in shooting off their tie of the previous cup shoot. Floyd and Waters tied in the prize shoot, Floyd finally winning first prize, the gun case; Waters won second, a beautiful watch charm, containing a genuine trout fly within its interior.

The programme was as follows:

Aug. 13, 1898.

BARGAIN DAY AT JACK WRIGHT'S BON MARCHE.

No. 1....Ten Japanese teacups	.10
No. 2....Fifteen china saucers	.50
No. 3....Ten hand-painted soup tureens	.50
No. 4....Fifteen cut-glass finger bowls	.75
No. 5....Fifty filagree punch pitchers (regular club shoot)	1.00
No. 6....Twenty chamber sets (prize shoot)	1.00
No. 7....Ten nickel-plated cuspidors	.50
No. 8....Twenty coffee pots (10 singles and 5 pairs)	1.00

Note.—In event No. 4 finger bowls will be thrown at 1 cent each.

Event No. 6 will be a prize shoot, handicap of misses as breaks. To the shooter breaking the greatest number of chamber sets in this event the proprietor of this store, old Jack Wright, will donate a handsome prize. All surplus added. Yer get's yer money's worth.

Buffalo Audubon Gun Club.

BUFFALO, N. Y., Aug. 6.—The badge shoot of the Buffalo Audubon Gun Club, held to-day, resulted in a tie between C. S. Burkhardt and A. Forrester, each scoring 24 out of 25. Forrester broke 25 straight in the shoot-off and won. J. J. O'Brien was the winner in Class B, D. Carew in Class C. The scores were:

Events:	1	2	3	4	5	6	7
Targets:	15	15	25	15	15	5p	*
J J Reid	11	11	21	4	11	9	..

On Aug. 25 and 26 the Mount Kisco Rod and Gun Club, Mount Kisco, N. Y., will hold its tenth annual target tournament, and are now completing arrangements for it. Concerning the event Mr. F. E. Wood, the secretary, writes us as follows: "The club is on the increase yearly, and has a fine club house, and the best club grounds in the county. The members promise all visiting sportsmen a good time, and all the shooting they want." Programmes and all necessary information can be obtained of Mr. Wood.

IN NEW JERSEY.

TRAP AT ELKWOOD PARK.

Long Branch, N. J., Aug. 10.—The main event was the Daly cup, 15 birds, $15 entrance, all standing at 30yds. Culbertson and White divided in No. 1, miss-and-out. Morfey and White divided in No. 2; Daly and White in No. 3:

Culbertson	12200212210	—11
Morfey	021122202220	—12
Daly	222222022222222	—15
Murphy	22110122222222022112220	—24
Ivins	22120112202122222221122	—24

Nos. 1, 2 and 3, $5 miss-and-out:

FORESTER GUN CLUB.

Newark, N. J., Aug. 13.—The Forester Gun Club members met on their grounds Aug. 13 to enjoy the regular monthly shoot at targets. Although a capital day for shooting only five shooters showed up, but these kept the trappers busy. There were nine events shot at unknown angles, 10-bird events. The score was:

J Fleming	5	5	9	7	8	7	8	6	10
J H Cummings	6	6	4	3	..	4	..	..	..
C Ripley	2	6	3	5	6	..	..	..	..
C Smith	..	..	..	..	9	9	6	9	7
D Fleming	..	..	..	..	4	9	7	4	10

We are getting ready to hold an all-day merchandise handicap shoot on Labor Day, Sept. 5, with all professionals barred from taking part in prize or money events.

John Fleming.

TRAP AT ELKWOOD PARK.

Long Branch, N. J., Aug. 13.—The main event was the Elberon handicap, 15 live birds, $20 entrance;

Barker, 28	111010120
Daly, 30	202221211222212
Murphy, 28	121112121121122

Ten birds, $10 entrance:

Barker, 28	1221121212111112120
Daly, 30	2222122122222122222
Murphy, 28	112222222212111120
Patten, 27	222222222222222222

Daly and Patten divided.

HACKENSACK RIVER GUN CLUB.

Below are the scores of two events shot on H. R. G. C. grounds on Aug. 5. But few shooters put in an appearance, possibly on account of the warm weather. No. 1 was at 10 live birds; No. 2 at 5:

Event No. 1:

Centredale Gun Club.

Centredale, R. I., Aug. 10.—We had the pleasure of having Jack Fanning, of California, with us at our special shoot yesterday. The day was a perfect one for shooting, and the score which Jack made, 98 out of 100, over the magautrap was the best score ever made in this State, and I think will stand so for a long time. There was a large crowd present to see the expert break targets, as Rhode Island is generally overlooked by most of the experts. Jack shot in fine time, and made a great many friends for Gold Dust powder. The rest of the shooting was away below the average, whether it was because Jack was present or not I don't know, but I suppose we all have off days, and this was surely an off day for all except Jack.

We were all glad to have him with us, as a more plesaant and agreeable person it would be hard to find. We are always glad to have shooters of his caliber with us, as it creates new interest in shooting.

We hope that he will soon visit us again, and all other experts, as the club stands ready to throw targets free as long as they want to shoot, because we think it makes new shooters, and that more than repays us for the targets:

Targets:	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5

Brockton Gun Club.

Brockton, Mass., Aug. 6.—The scores of the Brockton Gun Club, held to-day, are given below. The targets were thrown swiftly, but nevertheless Leroy broke 93 out of 100. Grant leads in the season's merchandise event; Worthing second, Allen third, Stork, Stanley and Barrett fourth, and close to the leaders. Leonard and Donaghue close to fourth. With three more shoots ahead, this order may be changed. Barrett was lucky in winning the watch charm after shooting off with Worthing. Next shoot Aug. 20.

Merchandise match, 25 targets, handicap:

Barrett	11111011111111111011101001	—20	—4—24
Leonard	11111111110111111100100000	—17	—9—25
Le Roy	11011111111011111111011111	—22	
Stanley	00111111111111011110011101	—19	—8—25
Grant	11011110110011001001011101	—16	—4—20

Annual dues, $1; initiation fee, $1.

American Canoe Association.

Nineteenth Annual Meet.

Stave Island—St. Lawrence River.

Aug. 5-19.

For the third successive time in late years the American Canoe Association has camped among the Thousand Islands of the St. Lawrence, the scene of many of the most successful of the early meets. As it has happened by mere chance, last year, with the meet held under the management of the Northern Division, with a Canadian commodore, the camp was held on Grindstone Island, just on the American side of the boundary. This year, with the Atlantic Division taking the meet in turn, and a commodore from New York, the camp site selected for various reasons is just on the Canadian side of the imaginary line through the channel of the St. Lawrence River.

It is quite possible that the A. C. A. has pitched its tents for the last time on old Grindstone, at least on the site endeared to the older men by so many recollections, as the entire northeast point has within the year been purchased by the State of New York for a park. Under what conditions the land will be open to the public is not yet known, but it is hardly probable that it will be available again to the A. C. A. At present it is guarded by big sign boards, "State Land."

THE POINT.

Though so close together, facing each other across a mile of water, Grindstone and Stave islands are very different, the latter being decidedly the more picturesque. The east slope of the big hill at Grindstone is an ideal camp ground for a comparatively large camp, beautifully leveled, with its broad outlook over Ell Bay, and sloping naturally and gradually to the pebbly beach. Its one defect, as proved by experience, is the lack of shade, there being no trees on it, though there is a fine grove adjoining on the north shore. Apart from the lack of shade, the disposition of the ground is such as could not be improved on for camping purposes.

At Stave Island the conditions are very different. The land is broken and rocky, and quite thickly wooded, less convenient for camping, but very much more picturesque. The shores are very irregular, jutting out in several rocky points with beautiful little bays between, instead of the long, straight line of beach at Grindstone. The ground adjacent to the water is much higher, some of the tents being 10 to 15ft. above the water, and yet very close to it. The ground is rough and rocky in places, and much more difficult to navigate after dark.

The outlook from the camp is quite different from that of Grindstone, it is more circumscribed, and in spite of the view to the west, over the many small islands, to the roofs and spires of Gananoque, there is nothing to compare with the magnificent panorama from old Grindstone Hill. The situation, however, has a special beauty of its own; just across from the camp, the passage being barely a hundred yards, is another island, McDonald, or Little Stave, making a beautiful picture, with its rocky points and the little Gananoque light on the edge of the channel between it and Stave. Going from the camp in any direction, one comes upon picturesque points and bays, and snug secluded nooks. For the lounging paddler, the artist and the photographer, Stave Island has many more charms than Grindstone Point. Within the camp the same characteristics are found, the appearance of the camp from a distance is far less striking than the many white tents and gay flags in full view at Grindstone; but each separate part of the camp, each charming in itself, is discovered in turn.

When Stave Island was first selected as an A. C. A. camp, nine years ago, one important consideration was the expense of a suitable wharf. It was decided to utilize the existing wharf, on the southwest side, and the entire camp was located with reference to this one consideration. The result was a large, straggling camp, with a long distance between the wharf and both the main and ladies' camps, the mess tent being in an inconvenient location. In returning to Stave Island this year, the officers had in mind the faults of the old camp, and decided on an entirely new arrangement. The old wharf was ignored, and a new one was built on the little bay just north of the old main camp, between it and the old ladies' camp. This bay, formed by two rocky points, is a pretty bit of water, and back of it is a little open space of level ground, between the two ridges of land which form the points. Here the headquarters is located, close to the wharf, with the semicircle of officers' tents, as usual, the camp-fire, etc. A very good camp store is located near the wharf, and a little back from the headquarters tents is the big mess tent, under the charge of Mr. McElveney, who has catered for the meets for the past three years. The meals, at the regular price of $1 per day, are very good indeed, and well served. Back of the main mess tent is the kitchen and the quarters for Mr. McElveney's staff.

This year, after several seasons of absence without leave, the official entertainer of the A. C. A., L. W. Seavey, is again present, with Mrs. and Miss Seavey. A big tent has been specially provided for him, and on Aug. 15 he will attempt a repetition of the circus of 1889, famous in A. C. A. annals. It is too much to expect that the great success of that year will be duplicated, as such an "aggregation" was never brought together before, and probably never will again be seen under canvas. Vaux is married and settled, and no longer seen at the meets. Warder is somewhere on the Pacific Coast, still busy in growing up with the country. Paul Butler has not kept up his practice in Roman chariot driving, and in fact none of the stars of the 1889 circus still illuminate the meets. At the same time Seavey is at work with all of his old-time energy and mystery, and it is not safe to say that the master mind that hatched a veritable sea serpent on a hill top on Willsborough Point, and fairly rivaled the professional display at Manhattan Beach with his impromptu storming of Sebastopol on Indian Bay, may not make a new record.

Near the mess tent is a tiny dark room, 4×5, built by Mr. A. A. Lewis, who secured such fine views of last year's meet. He is already at work about the camp, and his dark room is a great convenience to the amateurs.

In relocating the camp the officers moved the ladies' camp (Squaw Point) a little further to the north, immediately north of the ridge back of headquarters, in a pretty little bay. There is open ground in patches, and also plenty of shade, and the ground is quite high in places, some of the tents being well up from the water. This part of the camp is in every way superior to the old Squaw Point of Grindstone. The ladies' camp is well patronized this year, many members having their wives with them. It is probably larger in proportion to the main camp than ever before.

The main camp is practically on the same site as in 1889, just across the wooded ridge on the south of headquarters. The ground is very uneven and rocky, but what is lost in convenience is more than compensated for by the pleasant and picturesque aspect of the camp, the tents being scattered among the trees in irregular groups, instead of being ranged in regular lines on an open plateau, as at Jessop's Neck and Grindstone. Each plan has its advantages, and the choice is a mere matter of individual preference. For a very large camp the regular streets, with compact groups of tents each under its club burgee, is the more convenient and more sociable; but for a smaller number the other plan is as good, at the same time much less formal and conventional.

This meet promises to be about up to the average in point of numbers, a matter for general satisfaction, in view of the general experience in all lines of sport this year.

By the change of location it is possible to view the

THE CANOE CAMP AT STAVE ISLAND.

paddling and sailing courses from the point near headquarters, though at a greater distance than at Grindstone. The paddling course is marked by flags at quarter-mile intervals, running up the river with a finish off the point by the wharf. The sailing triangle is laid off out in the channel, where the wind should be truer than inside Ell Bay.

The camp is but four miles from Gananoque, easily reached by the little pioneer steamer Valeria, or by canoe. It is six or seven miles from Clayton, however, and more difficult of access, the only regular means being by the same steamer, making two trips per day, the early trip necessitating a wait of four hours after landing from the New York express. This was the only arrangement possible, however, and though the service is decidedly inferior to that of the A. C. A. launch of last year, it has the advantage of costing the Association nothing, as the steamer is a regular boat, and not under private charter by the Association. All the preliminary work of the committees has been well done this year, and every reasonable provision has been made for the comfort of members.

The camp opened on Friday, Aug. 5, Com. Dunnell, Secretary-Treasurer Schuyler, Mrs. Schuyler and quite a party coming up together. The weather for the first week was very fine, hot through the day, but with none of the humidity felt in New York, and very pleasant at night, the only rain being on one night. The Buffalo C. C. brought a good delegation, with its war canoe Quid Pro Quo, headed by Capt. Thorn. The New York C. C. has a party of eighteen in camp, including the wives of several members. Among the old members present are two from the first meet of 1880, Walter L. Palmer and W. P. Stephens; E. B. Edwards, the Seaveys, F. C. Moore, Com. Dunnell, Secretary-Treasurer Schuyler, H. C. Morse, P. F. Hogan, C. E. Archbold, H. H. Smythe, J. E. Plummer, Dr. Upham, L. B. Palmer, C. N. Towne, R. N. Cutler, J. N. MacKendrick. One of the many absentees is Thomas Hale, Jr., vice-commodore of the Atlantic Division, who resigned this spring, and is now in the naval militia, a quartermaster on the yacht Enquirer. The Mohican C. C. has but one representative, the Springfield and Vesper clubs, in fact nearly all the Eastern Division clubs are unrepresented, though Paul Butler and Mr. Appollonio are expected.

Mr. Archbold has Mab at camp for the main sailing races, but he will enter the record and other races in an open canoe. The New York C. C. has half a dozen of the old canoes, Toreador, Pioneer and others, with a new sailing canoe by Fry, of Clayton. These make up the bulk of the decked canoes.

The one prominent feature of this year's racing is the open canoe class, established by the revision of the rules last fall. While the racing machine has continued to ruin canoeing at a more rapid rate each year by the production of more extreme craft for the decked class and the trophy paddling, the number of open Canadian or "Peterborough" canoes has increased rapidly, many old canoeists from the States, who began their canoeing in the decked canoe with the double blade, finally settling down to the contented ownership of a true Canadian canoe, with a single blade as well as a double, even if not relying entirely on the former. For some time past there has been a growing inclination to race these service canoes, and last year, in addition to the paddling races, long open to them, a sailing race took place, the canoes carrying the conventional Canadian outfit, a single small sail and a pair of leeboards, with no rudder.

The Canadian canoe is one of the most useful boats ever known in America, an admirable instance of successful evolution. As built of recent years, she is strong, buoyant, seaworthy, easily propelled by a paddle, light enough for easy shore handling and portage, capable of carrying a crew of two or three with their duffle through a stiff rapid. With her proper sail and leeboards, and in skilful hands, she is fast under sail. The standard dimensions arrived at after long trials are about 16ft. over all, 30 to 31in. beam, 12in. least depth, 55lbs. weight, with ¼in. planking, or even a little thicker.

The object of including the open canoe in the racing rules was nominally to encourage the racing of legitimate service canoes such as were found at every meet, but unfortunately it was carried out in the almost universal manner. It was proposed to place the official limits of the rules at the points indicated by actual practice and existing boats, but when the amendment came up for action this proved to be impossible. In the important matter of weight the limit was cut from 55lbs., the standard of good practice in producing a serviceable and durable boat, to 50lbs., a low figure, and then a further fight was made successfully by the racing interests until it was provided that a deficiency of weight to an amount not exceeding 5lbs. might be made up by ballast. This in practice substituted a 45lb. machine for a 55lb. canoe.

In the same way the proposed minimum limit of depth, 12in., was opposed and killed after a long fight in the interest of the racing machine. A minimum depth of 12in., or even the 11in. offered as a compromise, means that the boat can carry a large load at times, and a reasonable load under all conditions in safety; while with 10in. side an open canoe must be far from safe. The latter limit, however, was more to the liking of the few who prefer racing to all-round work, and had to be accepted at the meeting. The limit of sail is a special provision relating to open canoes outside the general rules of the Association, which apply to decked and open canoes together. It was placed at a rather low figure, 40ft., as the ordinary Canadian canoe will easily carry 50sq.ft.

The result of the new rules is seen in the new canoes specially built to them and brought to the meet in goodly number, the English Canoe Company having had thirty orders this year for this model. The dimensions are 16ft. over all and 29½in. beam; the minimum, including ½in. margin each way from the standard beam of 30in., is allowed for slight variation from exact size. The paddling qualities are first considered, so the conventional Canadian model, with rockered keel, rounded ends below water, graceful sweep of bow and stern, and flat floor amidships, has been entirely abandoned. In the new canoes the keel is practically straight from end to end, with the least possible rocker and a full right angle and square corner where the keel joins the straight and vertical stem and stern. Such a canoe is fit only for a straightaway race course, and would be worse than useless in a rapid.

The bottom shows considerable deadrise, a very poor section for real use, but the thing for paddling, and at the same time all that is needed to carry but 40sq.ft. of sail. The freeboard has been cut down about to the 10in. limit, and the construction has been cut to 45lbs., at the expense of necessary strength.

In August, 1881, we watched from the camp on Lorna Island a fleet of three open canoes, each with two men, as they came up Lake George through a heavy sea, loaded with the duffle necessary for the long cruise through the Richelieu and Lake Champalin. After helping them to land, and with Bishop, Longworth and other of the then going A. C. A. men, we had the pleasure of meeting for the first time the representatives of Canada, E. B. Edwards and George Roger, J. L. and H. C. Rogers, and Mr. Beck and a friend, all of Peterborough. The canoes then came in for their share of attention, being radically different from the decked Rob Roys and larger models then used in the States. Messrs. Edwards and Roger had a typical Canadian canoe, built on the transverse rib system invented by Stephenson, she was named Verena and was then one year old. This canoe has since been seen at many meets, and she is now on the beach at Stave Island with the new racing machines. She has been in regular use ever since, for paddling, cruising, hunting and fishing, and she shows marks of both hard service and good care, as every canoe should. To all appearances, in spite of small repairs here and there, she is as good as ever, and quite fit for another eighteen years. Her planking is almost 5-16in., and she weighs about 55lbs.

The new canoes will probably last a couple of seasons, with good care, and before they are worn out they will be outbuilt by some new evasion of the letter as well as the spirit of the rules. As for the honest service canoes at the present camp, the chances are that they will have but a small show for the prizes. For the present at least, however, the new class will tend to revive the racing, though no permanent good can result from it.

The regatta committee decided this year to hold the less important races during the first week, and on Wednesday afternoon Event No. 23, ladies' tandem paddling, was called at 2:30, with two canoes, one manned by Miss Montizembert and Miss Wattles, the other by Mrs. Plummer and Miss Sands. The former won by about three lengths. Following this came a ladies' single race, Miss Montizembert defeating Mrs. Plummer. In the evening a dance was given in the mess tent, the music provided by a band from Gananoque. The camp turned out in full numbers, and the evening passed very pleasantly. An illumination of the fleet was planned for Thursday night, and a review for Saturday afternoon; while the circus was set for Monday night. The location offers every temptation for short cruises, and the attempt will be made to hold several. On Wednesday one was announced under the leadership of Mr. Edwards, but few responded. The annual meeting of the Atlantic Division was set for Saturday night, as well as the meeting of the executive committee.

W. P. Stephens.

The Forest and Stream is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

THE CANOE CAMP AT STAVE ISLAND.

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

Fixtures.

AUGUST.

19. Kingston, open, Kingston, Mass.
20. Huguenot, annual, Long Island Sound.
20. Park City, annual, Long Island Sound.
20. Duxbury, open, Duxbury, Mass.
20. Quincy, handicap, Boston Harbor.
20. Winthrop, club, Boston Harbor.
20. Woods Holl, championship, West Falmouth.
20. Beverly, seventh Corinthian, Buzzard's Bay.
20. Burgess, championship, Massachusetts Bay.
20. Royal Canadian, 27, 22 and skiff classes, Toronto.
20. Baltimore, McAllister cup, Chesapeake Bay.
21. Winthrop, cruise, Boston Harbor.
22-23-24. Quincy, challenge cup, Boston Harbor.
22. Wollaston, cup, Boston Harbor.
22. Cape Cod, open, Provincetown.
22-26. Seawanhaka-Phila. Cor., knockabout interclub match, Oyster Bay.
23. Wellfleet, open, Wellfleet, Mass.
26. Fall River, open, Mount Hope Bay.
27. Beverly, club meeting and informal race, Buzzard's Bay.
27. Queen City, 27ft. class, Toronto.
27. Huntington, annual, Long Island Sound.
27. Douglaston, special, Long Island Sound.
27. Cor. Marblehead, third championship, Massachusetts Bay.
27. Woods Holl, open, West Falmouth.
27. Shelter Island, special, Gardiner's Bay.
27. Taunton, open, Taunton, Mass.
27. American, cruise to Squam.
27-28. Corinthian San Francisco, cruise, Petaluma.
27. Canarsie, Corinthian race, Jamaica Bay.
27. Baltimore, Withers cup, Chesapeake Bay.
29. New Jersey Ath., club, Newark Bay.
30. Taunton, ladies' day, Taunton, Mass.
31. American, moonlight sail, Newburyport, Mass.

SEPTEMBER.

3. Savin Hill, open, Boston Harbor.
3-4-5. Corinthian Marblehead, cruise, Massachusetts Bay.
3. Woods Holl, championship, Sussett Harbor.
3-4-5. Wollaston, cruise, Boston Harbor.
3. Baltimore, Rear-Com. cup, Chesapeake Bay.
3. Beverly, eighth Corinthian, Buzzard's Bay.
5. Cor. Philadelphia, fall, Essington, Delaware River.
5. Larchmont, fall, Long Island Sound.
5. Norwalk, open, Long Island Sound.
5. Norwich, open, Long Island Sound.
5. Beverly, open, Buzzard's Bay.
5. Newport, club, Narragansett Bay.
5. City Point, club, New Haven, Long Island Sound.
5. American, skiff class, Newburyport, Mass.
5. Jubilee, championship, Massachusetts Bay.
5. Burgess, open, Massachusetts Bay.
5. Lynn, open, Massachusetts Bay.
5. Quincy, handicap, Boston Harbor.
5. Royal Canadian, Prince of Wales cup, Toronto.
9. Pacific, interclub regatta, San Francisco Harbor.
10. Beverly, tenth Corinthian, Buzzard's Bay.
10. Royal Canadian, skiff class, Toronto.
10. Riverside, annual, Long Island Sound.
10. Hull, open, Boston Harbor.
10. Massachusetts Y. R. A., rendezvous, Hull.
10. South Boston, handicap, Boston Harbor.
10. Winthrop, cruise to Hull.
10. Burgess, sail-off, cruise, Massachusetts Bay.
10. Woods Holl, open, Woods Holl.
10. Taunton, club, Taunton, Mass.
10. Baltimore, McAllister cup.
10. Chicago, fall, Lake Michigan.
11. Corinthian San Francisco, regatta, San Francisco Bay.
11. Massachusetts Y. R. A., review, Hull.
17-18. Corinthian San Francisco, cruise, Vallejo.
17. American, cruise to Plum Island.
17. Baltimore, Rear-Com. cup, Chesapeake Bay.
17. Queen City, 22ft. K class, Toronto.
26. Newport, ladies' day, Narragansett Bay.
29. Miramichi, Gould cup, Newcastle.
30. Taunton, ladies' day, Taunton, Mass.

OCTOBER.

14. Miramichi, Watt cup, Chatham.

Sag Harbor Y. C.

SAG HARBOR, Long Island, Aug. 6.—Open race, with twenty-six entries. Wind brisk; course twenty miles. Summary:

		Finish.	Elapsed.	Corrected.
Mascott	2 06 25	5 58 34	3 51 58	3 41 20
Sito	2 06 25	5 51 34	3 51 58	3 41 20
Neuzava	2 06 00	5 57 31	3 57 31	3 33 25
Hoodo	2 06 45	5 25 52	2 23 07	. .. ..
Turene	2 05 00	5 42 54	3 37 54	3 32 06
Bantam	2 06 57	Withdrew.		
Poco	2 06 10	Withdrew.		
Sloops.

*Winifred	2 11 00	Withdrew.		
*Curlew	2 11 00	Withdrew.		
*Snap Shot	2 11 00	Withdrew.		

* Failed to cross line at start within the proper time.

Sito carried away head stay. Started anew. Sito first prize, Turene second prize.

Wawa, first; Atlantis, second.

The Robinson Cup.

EAST MORICHES, Aug. 13.—First annual race for the Robinson cup. It was strictly a Corinthian event. The course was four times over a two-mile-and-a-half course to windward and return. The Little Hazel was sailed by Miss Lillian Vanderbilt. The starters were: Watchogue, D. E. Austin, Brooklyn; Fides, Morris B. Meade, South Orange; Pawnee, George W. Owens, Brooklyn; Sybil, Walter Gibbs, Brooklyn; Yankee, Harry B. Growtage, Brooklyn, and Little Hazel, Miss Lillian Vanderbilt, Montclair.

	Finish.	Elapsed.	Corrected.
Watchogue	4 50 00	1 19 00	1 15 20
Fides	4 46 15	1 16 45	1 13 40
Pawnee	4 45 25	1 17 03	1 17 03
Sybil	4 39 25	1 09 05	1 08 40
Yankee	4 43 20	1 14 08	1 11 58
Little Hazel	4 50 25	1 19 26	1 15 31

The Oshkosh Regatta.

OSHKOSH, Wis., Aug. 10.—All students of the history of the early West know that the Northern Fox River was the outlet from Lake Michigan for the west bound boating travel of the fur trade in the first quarter of this century. The early fathers knew well the trail running from the Great Waters up the Fox to the Grand Portage, which was to be crossed before the broad stream of the Wisconsin was reached, which latter carried the canoes to the Mississippi. All the fur traders of the West knew also the great shallow expanse of the Fox River, a body of water thirty-two miles long by an average of ten miles in width, about which the Winnebagoes dwelt and which bore their tribe name. This lake lay between the interior and the open waters of the big lake, and itself, upon occasion, could be tempestuous and rude. It was a great sporting region for the white and red men, and the fur traders were soon upon the ground with a little trading post, which was established at the mouth of the river. In the year of 1836 two families moved over from the Green Bay and began the first regular white settlement on Winnebago Lake, which was then called the "Town of Winnebago." In 1852 the name was changed to that of the chief of the Menominees, Oshkosh, and that name has been retained.

In the year of 1898 the city of Oshkosh has some 35,000 souls, and is a busy community of large business and manufacturing interests. The country round about still retains relatively its resources as a sporting region for fishing, shooting of wildfowl, and naturally for sailing. To-day, as in 1832, the majority of the inhabitants are sportsmen, interested in things out of doors. A better "sporting town," as the expression goes, it would be difficult to find. It is history to be remembered that every sporting enterprise of the city of Oshkosh has been well attended, squarely conducted and well praised by all the visitors. The men of Oshkosh are noblemen in their methods.

So much for preface, and to ground the fact that Lake Winnebago is perhaps the best of our Western inland sailing waters, big enough for steady winds and rough seas, but wide enough so that the visitor has an even chance in a sailing race with the local man, in that he need not study shore breezes and landmarks, but may hold to the open and win if he can sail.

In older times, before the pinch of hard times in the present decade, a considerable sailing interest sprang up on this water, and the cities of Oshkosh and Neenah, only fourteen miles away, had busy little fleets. Then came a decline in the sport, which also seemed to affect many of our other lakes. Yachting in Milwaukee, in Chicago, at the resort lakes of lower Wisconsin, had a setback from which it seemed slow to recover. Last year there was a decided revival, especially in the smaller classes, and many new boats came into Lake Winnebago, as well as to Oconomowoc Lake and other lakes of the Waukesha chain, much frequented by well-to-do Chicago and Milwaukee citizens during the summer season. Many Chicago yachts went into commission this summer. At Milwaukee in July a regatta was held during the Carnival week, bringing together a fleet such as has not been seen before in our waters, unheralded as they are. This week there is a big regatta for the big boats at Green Bay. Last week a very interesting race was sailed from Chicago to Mackinaw by the best of the big boats of the Chicago fleet. And all this time, even during the slump in Wisconsin and Chicago yachting, the men of White Bear and Minnetonka lakes, the wonderful little inland seas about the twin cities of Minnesota, have been going right along, building good boats, and each year designing better ones. Dr. Welch, the crack amateur designer of St. Paul; Peterson, of Minnetonka; Gus Amundson, etc., became names as well known on Winnebago and Lac La Belle as at their own homes in Minnesota. The sailormen of Wisconsin looked west and they looked east for good boats, but last year, and this year still more, they decided to have the best boats they could buy, and they resolved to sail. There was a distinct revival in small yacht sailing in this part of the country. A very good interest exists now, and it is apt to become still stronger. When one adds to the above data such facts as the forty odd boats which sail in the Fox Lake, Ill., Y. C. races, and also keeps in mind the goodly contingent of handy ones of Pistakee Y. C., near by to Fox Lake, and does not forget the twenty odd little ones of the Saddle and Cycle Club, which sail off the north division of Chicago, it surely seems that this part of the West may this season claim some station as a boating precinct.

History of the Green Lake Cup.

Last year the Green Lake Y. C., of Green Lake, Wis., put up in competition a handsome challenge cup for 21-footers, open to any organized inland lake yacht club. A good little regatta was the result, in which there were entered W. H. Dupee's Windy Watson, from Oconomowoc; Hypatia, of Green Lake; Corona, of Neenah (designed by Dr. Welch, of St. Paul, twice winner of the Felker cup on Lake Winnebago); El Capitan, winner in Delavan Lake season races, and Elk, at that time owned in Oshkosh. Elk was yet another boat designed by Dr. Welch, and such was the confidence of the Oshkosh men in his ability that some of them purchased Elk and brought her direct to Green Lake, securing Dr. Welch to sail her, for the first Green Lake cup regatta. The result is known. Elk won handily, and was hailed at Oshkosh as the last best thing. Thus the Green Lake men lost their cup the first time they put it up, it being taken to Lake Winnebago. Naturally they resolved to go after it the next year.

On Oconomowoc.

Meantime on the busy waters of the Oconomowoc lakes many things were brewing in a nautical way. The boats of the preceding season were found not good enough. Mr. Wm. Hale Thompson and Mr. W. H. Dupee both ordered boats built by Amundson, out in Minnesota. These boats were sister boats, but Mr. Thompson, who sailed her many times, said he thought his boat, Avis, was hardly so fast as Mr. Dupee's Ariel. Yet Avis proved fast enough to win five times in six starts, and incidentally annexed the Pabst cup, offered for best yacht in Waukesha county races, she defeating Arab, of Pine Lake, owned by Mr. Nunnemacher, of Milwaukee. It was rumored about that Avis would prove a hard one to beat this summer.

On Winnebago Again.

Up on Winnebago, where the victorious Elk had landed the first of the Interlake trophies for that section, matters were not allowed to rest. Mr. Gates had a desire to clean up the fleet, and he sent East for the Weymouth wonder, Gleaner, that had won, it is stated, forty-eight races out of fifty-five starts. On fresh water her lines were discovered to be changed, and no amount of lightening and altering of rigging would make her do, the other boats at least finding it not difficult to take her measure in the weekly bouts. Wasp, a Western boat, once of the first flight, now turned out dead by comparison, and Tarpon, owned at Neenah, was thought much better. Kathleen, a Dyer boat, of Minnetonka, and also owned at Neenah, was still a hopeful quantity. The Oshkosh men pinned their faith this year to Iota, Dr. Welch's last contribution to their fleet, owned by Phil Sawyer, of Oshkosh.

The Oshkosh Invitation.

This was the situation of affairs, roughly speaking, among the inland lakes hereabouts at the time of the Oshkosh invitation to come to Lake Winnebago for a big regatta, Aug. 6 and following, sailing for the Green Lake cup, the Felker cup (the older trophy, put up some years ago by Com. Felker, of Oshkosh), and the Oshkosh trophy cup, offered by Oshkosh Y. C. The club made its plans with accustomed energy and care, and the result was that in all eleven boats were entered, Elk, Iota, Gleaner and Wasp, of Oshkosh Y. C.; Avis, of Oconomowoc Y. C.; Tarpon and Kathleen, of Neenah Y. C.; Pistakee, flag boat of Pistakee Y. C., Pistakee Lake, Ill.; Cuttysark, Milwaukee Y. C.; Pleasant Point, Green Lake Y. C.; Gadfly, Fox Lake Y. C., Fox Lake, Ill. No boat came on from White Bear or Minnetonka. Now, at the conclusion of the regatta, it is in one's power to say that the whole affair was a very fortunate one, happily concluded in every respect. The visitors cannot speak highly enough of their hosts of Oshkosh, and although the Oshkosh men will have to follow one of their cups to a foreign water, and admit an alien boat next year to their own waters with the competition for another cup, and lose still a third cup to the same rival, they are too plucky to make any bemoanings, or to stop at this state of the proceedings. We may expect a new boat at Oshkosh next year, and at the big final Interlake regatta at White Bear, the close of this month, it is at least possible that Iota will again be on hand to try conclusions with the rival club which this week sent out the victor.

The Type.

Progress in these 20-footers in this part of the world has been a progress in ugliness. First one man and then the next has gained nerve enough to make his boat a little homelier than the last one, and the result has been an apparently absurd boat, which is the most deceiving object ever was. More and more shovel-nosed one after the other, the model has been evolved until in boats like Iota and Avis the lines are those of a shingle with one end rounded. Such a boat would not at first seem suited for heavy weather, yet they are found to pound less than the models of two years ago. They gain much waterline with rail under, do fairly well to windward, foot fast with wind abeam, and are lovely running free. This was the opinion after seeing the boats most ultra of all these gradually changing models, Iota and Avis, take practically all the competition into their own hands. Never were two sourer looking hulls that sailed any sweeter than they.

First Day, Aug. 6, Green Lake Cup—First Heat.

For the first heat of the Green Lake cup there were five starters, and they crossed the line in the following order: Iota, Pleasant Point, Gadfly, Avis, and Pistakee. Iota held her lead well on the windward leg, but within five minutes the hopes of the Oshkosh men fell as they saw her drifting helpless. Her stick had snapped short off, and all she could do was to wait for a tow. Gadfly was in little better luck. Her board had struck a reef so that she was wrenched and leaking, and after completing the six knots' triangle course for the first time she withdrew. Pleasant Point made it out badly, and finished so late she was not timed. Commodore Henry Hertz, of Pistakee Y. C., sent his boat around pluckily for the full course, but it was clearly all Avis, which won by 13m. 30s. over her only competitor.

The judges were: Com. H. L. Hertz, W. H. Dupee, E. Rosing, C. A. Barnum, L. M. Mann; starter, A. B. Hooper; timer, G. M. Hasbrouck.

Capt. L. M. Mann, U. S. Engineers, is the officer in charge of the Government navigation improvements on the Fox River, and is an ardent sailorman. He was appointed chairman of the judges, and his accuracy kept all things in order. Thoroughly acquainted with all the soundings of this lake, it was he who laid out the course. The excellent synopsis of the races which FOREST AND STREAM is able to give were prepared by Capt. Mann for the records, and very much credit should be given him for his able aid at all stages of the details in the judges' work. He received the best of assistance from his associates. Following is the record:

For the Green Lake Y. C. challenge cup; best two of three heats.

Cup subject to challenge from any organized inland lake yacht club in good standing. One entry only from each club. First two races open to all challengers. The third race open to the winners of the two previous races only.

Measurement formula: L.W.L., plus square root of sail area divided by two equals racing length.

Yachts shall not exceed 20ft. racing length.

Rules of Green Lake Y. C. for challenge cup contest to govern.

Official start, 2:30:

	Start.	Elapsed.
Iota	2 30 14	. .. ..
Pistakee	2 30 16	2 43 20
Gadfly	2 30 20	. .. ..

Avis	2 30 50	2 29 50
Pleasant Point	2 30 55	. .. ..

First Round.

First Leg.—2:30, start; wind S. by E. strong. 2:35, Iota broke spar. 2:40, wind S. by E. strong. 2:45, port tack; Pistakee, Avis, Gadfly. 2:46, port tack; Pleasant Point. 2:47, starboard tack; Pistakee. 2:52, starboard tack, Avis; 2:53, starboard tack; Pleasant Point. 2:54, in stays; Gadfly. 2:57, port tack; Avis, Pistakee.

Second Leg.—3:02:30, Avis jibed. 3:06, broke out spinaker; Pleasant Point. 3:07, broke out spinaker, Pistakee. 3:09, wind S.W. by S., strong.

Third Leg.—3:23, wind S.W. strong.

Second Round.

First Leg.—3:55, wind S. by W. ¼ W., very fresh. 3:45, starboard tack; Avis. 3:58, port tack; Gadfly and Pleasant Point. 4:00, shook out reef; Avis. 4:03, starboard tack; Gadfly and Pleasant Point. 4:04, port tack; Gadfly and Avis. 4:05, Gadfly out of race, disabled. 4:07, starboard tack; Avis. 4:13, port tack;, Pistakee. 4:14, starboard tack; Pistakee.

Second Leg.—4:18, broke out spinaker; Avis. 4:22, broke out spinaker; Pistakee. 4:26, broke out spinaker; Pleasant Point. 4:23, light wind, S. by W. ¼ W. 4:35, very light, S. by W. 4:30, Pistakee took in baby jib and put up working jib.

Third Leg.—4:39, fresh wind, S.S.W.

Second Day, Aug. 8, Green Lake Cup—Second Heat.

Avis and Iota met again, Iota having gotten on a new mast from Racine, but Iota could not foot it with the Oconomowoc wonder, which was sailed by Skipper W. G. Thompson in superior fashion. Pleasant Point but faintly upheld the Green Lake banner, and Gadfly, rigged with lofty canvas for the land breezes of Fox Lake, proved too top-heavy for the more open and heavy water. Iota was thought not to have been sailed for all there was in her, and her admirers still insisted that she could show the visitor a clean pair of heels if the wind proved stiff and there ensued no more hard luck. Pistakee was well sailed, but was in too warm company for this year's standards in her class.

The boats got away in the following order: Iota, Avis, Pistakee, Pleasant Point, and Gadfly. They were ordered to sail the free leg first, beating on the home stretch. Iota, therefore, at an early stage of the race sought to avail herself of her big spinaker, in order to draw still further ahead of her nearest rival, Avis. Iota's crew had serious trouble with the spinaker, which ballooned and swung to leeward, making an ugly hamper, which caused delay. Avis passed her, and was never again headed by any of the fleet. Running home on the first round, Iota lost in the windward work, being now 2m. behind Avis. Rounding for the second attempt at the free leg, Iota again tried the spinaker, and edged up a bit on Avis, which was content with jib. Iota now sought to take advantage of a local knowledge of air currents, and hunted for a stiffer wind, which was expected off the mouth of the river. The wind shifted on her again, and the move lost her all hope of the race, and she finished last, about 20m. behind the winner. Pleasant Point withdrew at the beginning of the third leg, second round.

The judges were: Com. Hertz, E. Rosing, W. H. Dupee, B. B. Felix, and Capt. L. M. Mann.

Avis won the Green Lake cup, two straight heats.

The record follows:

Official start, 2:32:30.

	Start.	Elapsed.
Iota	2 32 51	2 48 37
Pistakee	2 33 04	2 33 29
Avis	2 32 57	2 29 40
Pleasant Point	2 33 30	. .. ..
Gadfly	2 33 14	2 43 59

First Round.

First Leg.—2:32, wind N.W. by W., fresh; at start, broke out spinakers, Iota, Gadfly and Pistakee. 2:33, broke out spinaker; Pleasant Point. 2:45, Avis passes Iota to windward; Iota's spinaker becomes unmanageable; swings to leeward in water and is taken in. 2:46, Pistakee takes in spinaker; wind hauled to after port quarter; Pleasant Point distanced at first buoy. 2:49, wind S.W., fresh.

Second Leg.—3:00, wind S.W., fresh.

Third Leg.—3:10, wind N.W., fresh. 3:20, N.W. by W. 3:37, due W. 3:14, Pistakee port tack. 3:22, Avis starboard. 3:24, Avis port. 3:25:30, Iota starboard. 3:28:30, Avis starboard. 3:29, Gadfly starboard. 3:32, Avis port. 3:35:30, Avis starboard. 3:36:30, Iota starboard. 3:38, Avis port. 3:40, Iota port.

Second Round.

First Leg.—3:45, wind N.W., fresh. 3:42, broke out spinaker, Iota and Pistakee. 3:45, broke out spinaker, Gadfly and Pleasant Point. 3:55, took in spinaker, Pistakee and Iota.

Second Leg.—4:04, wind N.E. by E. 4:15, W. by N., light. 4:08, Iota broke spinaker, and 4:15 taken in. 4:11, Pistakee broke spinaker, and 4:17 taken in.

Third Leg.—4:35, wind N. by W., fresh. 5:00, N., light. 4:22:30, Avis on port tack. 4:25, Avis starboard. 4:29, Iota starboard. 4:30, Pleasant Point gave up. 4:35, Pistakee port. 4:36, Iota port; Pistakee starboard. 4:37, Iota port. 4:44:30, Avis port. 4:45, Iota starboard. 4:45, Gadfly port. 4:47:30, Avis starboard. 4:48:30, Avis port. 4:50, Avis starboard. 4:50, Pistakee port; Iota port. 4:53, Pistakee starboard. 4:46, Avis port. 5:01:30, Avis starboard.

Course from home buoy to buoy No. 3, E. by N., leaving all buoys to starboard.

Third Day, Aug. 9, Felker Cup Race.

The extraordinarily favorable weather continued, and as upon the previous day a large crowd attended, so that the course was crowded with many large and small pleasure craft. The local interest in the Felker cup is enthusiastic, and many Oshkosh men hoped against hope that the crack local boat, Iota, would justify the confidence placed in her, and have better luck in her handling. Her crew very well fulfilled this hope, and brought the boat to the front in form surprising after the performance of the preceding day, a fact attributable in part to an increased sail area, a larger mainsail having been secured and fitted. As she sailed to-day, Iota was apparently a sure winner, having Avis well in hand, but again fatality was against her, and she lost a fatal two minutes, disabled, and finished second by the narrow margin of 26s. Avis therefore added another and much prized trophy to her collection. Tarpon III. was well sailed, and kept up interest in her performance to the last, the racing having additional interest to the spectators through the fact that the start was by handicap, so that the finish showed the boats in their corrected relative positions.

Eight boats strated: Elk, Skipper H. L. Battis; Gleaner, Skipper Jas. Jones; Wasp, Skipper Fred Luhm; Iota, Skipper Wm. Love; Tarpon, Owner-Skipper Fred Shattuck; Kathleen, Skipper Wm. Davis; Avis, Owner-Skipper Wm. Hale Thompson; Pistakee, Skipper Nick Morris. The start was by three assembly guns, two preparatory guns, one gun to start. Iota, Avis and Pistakee were given orders to start on the same handicap, and at the gun their bunch crossed the line in the order as written, Avis to windward of Iota, which she almost at once passed, the crew of Iota taking off their caps as Avis drew by. Mr. Thompson followed his earlier tactics without variation, having learned exactly what his boat would best do, and having a plan from which he did not depart. He eased off and went freer than any boat of the fleet, dropping so far to leeward that many openly condemned his seamanship. Iota stood up more closely and held on further, showing in the lead at the first buoy. Avis reached for this buoy with her starboard tack, but to come about with a short kick to round it, Iota being first off, with everything drawing, on the second leg of the course. Either Avis or Iota turns like a wheelbarrow, and Avis wore almost under Iota's stern at the buoy.

Meanwhile Pistakee was standing off stiff as a meeting house, far to windward, and a very pretty battle was going on between Tarpon, Gleaner and Kathleen, which were going neck and neck under a stiff wind. Elk, disabled twice on the first leg, was far behind, and Wasp, delayed by a broken bobstay, was out of it.

With wind abeam, Iota seemed to outfoot the Oconomowoc boat to the second buoy. Both boats jibed. Iota again tried the risky spinaker, this time with greater success. Avis contented herself with balloon jib, and at one time closed up the gap on Iota when the latter had a bit of trouble with the spinaker boom, which did not break out fully at the top, though Iota managed to pack her canvas and gained down the free leg, her spinaker finally drawing full. Kathleen declined to jibe. Tarpon was now leading her immediate rivals, Gleaner and Kathleen, all three of these boats using spinaker. A duel between Kathleen and Gleaner now followed, and Gleaner drew ahead decisively. Wasp was now disabled and withdrew. Pistakee could not be called anything but game, and her heavyweight crew kept her pounding on the course. Pistakee bent on a storm jib, far back on the home leg, at about the time Iota was taking in spinaker to round the home stake.

At the end of the first round Iota had gained 1m. 3s. on Avis, and excitement ran high, for she was thought now on the way to retrieve some of the local prestige. Iota held her own apparently, or, so far as could be told from the judges' boat, was still gaining on Avis, when she once more met ill luck, and was disabled in the course right at the end when she seemed sure to win. The lacings of her jib tore out, and she ran up into the wind helpless, losing what was variously estimated at two to three minutes of time. Skipper Thompson, of Avis, upon the other hand, declares that at the time of the accident Avis was pulling up on Iota. He further adds that on the second leg, with wind abeam, when Iota again gained on Avis, he was himself busy bailing, in order that he might not go into the home stretch with water tumbling down into his bows, which he knew would be fatal to his best chances. Being a heavyweight, his weight to leeward in the boat would prevent her from footing her best. At any rate, Iota, after hasty repairs, began to crawl up again on Avis, and her game fight brought out much applause. She gained 1m. 27s. on the second leg, and the boats jibed with only 1m. 11s. between them at the beginning of the run home. Meantime, so distinct was the difference between these boats and those of earlier models, the best of the others of the fleet were just rounding the second buoy. Tarpon and Kathleen shrewdly tacked to starboard, standing out into the open and getting a stiffer breeze. Gleaner, well sailed, still led Kathleen. Elk now began to show a greater interest in affairs, and appeared forging up a bit.

On the run home Iota again tried the spinaker, and it showed a certain gain over the little balloon jib of Avis. It was thought that Iota would win, as she walked in so rapidly on her rival. Again Avis eased off and ran so far to leeward that her case seemed hopeless, the fact being that her skipper could not see the home flag, and had miscalculated his course. Amid great excitement Iota held on for a close shave of the home stake, and cheers greeted her as the foregone winner. All at once Avis came sharply over and rushed straight for the line, with everything drawing, wind abeam. She too laid a course which would bring within touching distance of the stake, and as the two boats converged on their courses a collision seemed certain. Yet Avis crossed just 26s. ahead of Iota. Both boats had been admirably handled, and they had given a grand exhibition, and both were cheered to the echo.

At the finish of Avis and Iota, the five other boats of the fleet showed all rounded into the home reach, and all in line, winged, a very beautiful sight. Tarpon was well in advance, fairly losing Pistakee, which had at first given her concern. Pistakee next, and then Gleaner, still leading Kathleen after a near thing for six knots. Some distance back came Elk, last, and a bad last, in this meeting of the boats of this year, whereas she was a cup winner last year.

Crew of Avis was as follows: Wm. Hale Thompson, owner and skipper; Percival Thompson, sheet; Gale Thompson, jib; Walter H. Dupee, stays. The record follows:

Felker challenge cup race. One heat.

Cup may be competed for by all yachts owned by organized yacht clubs in the United States, or by any person a citizen of the United States who shall be a member in good standing in any such club.

Yacht eligible must come within the classification of the rules of the Oshkosh Y. C., known and denominated under such rules as yachts of the first class.

Rules of the Oshkosh Y. C. to govern.

First class shall consist of all the yachts not under 22ft. and not over 26ft. racing length.

Measurement formula: L.W.L., plus one-third overhang, plus square root of sail area divided by two, equals racing length.

Time allowance shall be determined according to the Herreshoff table.

First Round.

First Leg.—2:36, Elk disabled; started 2:38:30. 2:40, Elk disabled; started 2:41. 2:50, Avis on starboard tack. 2:51, Iota on starboard tack. 2:53, Pistakee on starboard tack. 2:54, Avis port tack. 2:56:30, Pistakee port tack. 2:58, Kathleen starboard tack. 2:59, Gleaner and Tarpon starboard tack. 3:03, Elk starboard tack; wind E.S.E. strong.

Second Leg.—Wind E. by S. strong.

Third Leg.—3:12, spinaker on Avis. 3:18, spinaker Iota. 3:20, spinakers on Gleaner, Tarpon and Kathleen. 3:25, Iota took in spinaker. 3:27, Pistakee bent on storm jib. 3:28, Wasp disabled and out of race. Wind S.E. by E., strong.

L. M. Mann, E. H. Van Ostrand and Com. Hertz acted as judges.

Second Round.

First Leg.—Wind S.E. by E., strong. 3:44, Tarpon on starboard tack. 3:44:45, Iota disabled. 3:46:30, Avis on starboard tack. 3:49, Iota on starboard tack. 4:00, Tarpon on starboard tack. 4:03, Kathleen on starboard tack. 4:03, Elk on starboard tack.

Second Leg.—Wind S.E. by E., strong.

Third Leg.—Wind S.E. by E., strong. 4:10, Iota set spinaker. 4:15, Avis set spinaker.

Judges, L. M. Mann, chairman.

Fourth Day, Aug. 10, the Oshkosh Trophy Cup.

There still remained, as a local sailorman put it, one more cup for Avis to win. The Oshkosh trophy cup contest was the last race of the regatta week for Oshkosh. The weather for the first time turned unfavorable. Rain fell in the morning, and the air was still. Afternoon the prospect was still lowering, but the wind grew fresh, then strong, kicking up plenty of sea. All the boats that had entered in the Felker cup appeared to sail for the Oshkosh trophy, with the addition of Cuttysark, of Milwaukee, owned by Mr. McGregor, of Milwaukee Y. C. This boat is a past number, as things go now, being three years old. Commodore Coleman, of Milwaukee Y. C., resurrected her and brought her over with the sportsmanlike purpose of helping on the fun. She was sailed by Cyrus Williams, Commodore Coleman second in immediate command. Cuttysark was not a very dangerous quantity at any time, but her crew were popular men at the regatta.

It was a reefing breeze at 1 P. M., and white caps were rolling. Cuttysark reefed, Wasp reefed, Tarpon reefed. Avis refused to take in anything. Iota bent on a storm jib. They were sent off with flying start today, and crossed the line in the following order: Gleaner, Avis, Kathleen, Tarpon, Pistakee, Wasp, Cuttysark, Iota and Elk.

In the run to the first buoy Avis early showed ahead, following her old game of running well eased and dropping far to leeward of all the others. Tarpon made good weather of it, and led the procession back of Avis, and was thought to be sure to round the first buoy ahead of the Oconomowoc boat. Mr. Thompson stood calmly on. Tarpon made a good push for the place at this turn, the situation between Tarpon and Avis here being the same as that between Avis and Iota at the finish in the Felker cup. Avis used identical tactics, jumping into starboard tack and seeming fair to run Tarpon down as they converged. Avis crossed the bows of the judges' boat near by and made a fine spectacle, the crew all out and lying like spiders along the rail. Her speed carried her by Tarpon's bows with a wider gap than at first seemed likely, and with a short port tack she drew ahead of Tarpon and rounded ahead, with 31s. to spare, Tarpon next, Iota third. Meantime Pistakee had at once after the start gone on starboard tack to get clear of the crowd, but now showed well up with the rest, Wasp and Cuttysark far behind, the little Cuttysark making very bad weather of it.

On the second leg Avis increased her lead, and a duel between Tarpon and Iota attracted attention. Iota drew up and passed Tarpon to windward, outfooting her thence on. Gleaner now drew on and challenged Elk. Pistakee showed rough weather, but her crew had orders to sail her or sink her. At the third buoy Iota and Avis both jibed. Iota and Tarpon broke out spinakers, Avis holding on with mainsail and jib as first set. Tarpon challenged Iota gamely, and both with their big canvas and the stiff wind drew up on Avis. Next came Kathleen, Elk, Gleaner, Pistakee. Kathleen and Gleaner both broke out spinakers, the great canvas of the latter boat making a grand show as she started down the free leg. Pistakee also used spinaker, and Elk, trying also to use this trying sail, fell into evil ways and ran up into the wind disabled for a few moments. Gleaner now decided she could carry more mainsail, and sent out a man to shake out her reef. At this moment her great spinaker got the wind under it and bellied up and over to windward, her boom going under and her two men, who were busy with the reefs, being swept off into the water. The men had a lively scramble, but were hauled aboard, one having to swim a short distance. Gleaner did not entirely lose way, and did not come up into the wind at all, but rescued her crew and held her course, which cool and able seamanship brought a hearty cheer from everybody within sight, as she got her big spinaker again under control and pluckily held her own. Kathleen here drew past Gleaner.

At the home buoy, first round, Avis and Iota had another of their struggles, and again Avis rounded ahead, though by only 18s. Tarpon, Gleaner, Pistakee and Elk made a close group at the home buoy, but the weather now looked black and squally, and Elk had enough of it, so left the course and sailed to harbor. Cuttysark, with her gallant commodore and plucky crew, was well awash by this time, and the boat proved too wet for comfort. She followed Elk, cutting the last buoy and going home. Wasp also cut the course and retired. Rain fell and matters looked ugly, but the gusts of wind were not so bad as was expected, and the others of the boats held to their work.

On the first leg of the second round Avis still showed her heels to Iota, which, however, hung on grimly, Tarpon also insisting on recognition. Kathleen, Gleaner and Pistakee rounded in above order. Down the second leg this order of the boats was not changed, the leading ones being still Avis, Iota, Tarpon.

On the run home the three leaders employed the same tactics of the earlier stage of the race. Avis held on under jib and mainsail, Iota and Tarpon breaking out spinakers. Again Avis fell far off to leeward, and again Iota seemed sure to collar her at the stake, as she was picking up distance under the big spinaker. Again the skipper of Avis held on till it seemed he was lost at sea, then suddenly jibed and once more threatened to

cut down Iota as they sped toward each other at the stake, Avis with wind on her quarter sailing more free. Iota made a grand run for the finish, but Avis stubbornly pushed her nose across 10s. in advance, not needing the time allowance which, under her proper measurements, Iota now was obliged to concede to Avis. Once more the grand little Oconomowoc boat was declared winner, and she thus added a fourth cup to those she already had taken in her short career. One by one Tarpon, Kathleen, Gleaner and Pistakee took in spinakers, dropped peak to jibe and crossed the line in order as stated. Commodore Hertz took a look at Pistakee, said he presumed her crew would be glad to get out of her, and added that he was going to have a boat pretty soon with which he could make a nearer showing at the finish.

At the close of the race Tarpon and Avis took a tow for a very wet and nasty looking ride of fourteen miles over to Neenah. On the following day Nodaway Y. C., of Neenah, offered a cup for competition, and it was the expressed intention of Skipper Thompson to annex all the cups left at large on Winnebago waters. Certainly Mr. Thompson has set a very good example for plucky sportsmanship, and he is himself very much of a sportsman. He is vice-president of the Chicago Athletic Association, captain of the football team upon occasion, has lived five years as a cowpuncher, and is an all-round outdoor man, who does not know anything about quitting. He has done about all for the Oconomowoc Y. C. that could be asked this week. At White Bear regatta, later this month, he will stand back and allow Walt. Dupee to try his boat Ariel, and the club will have hope of the latter boat also giving good account of herself.

By the terms of the Felker cup all races in its competition must be sailed on Lake Winnebago, so the Oshkosh men may count upon Avis or some successor coming to their lake again next summer to give them a chance for revenge. In the meantime Oshkosh may have on another new boat or two, and the result is not yet in sight for next year.

In view of the very plucky races sailed by Iota, it is by no means sure that Avis can forever beat her, and many friends urged Mr. Sawyer to take Iota to White Bear week after next and give her fuller trial with Ariel and the others who may be on hand. At last accounts, Mr. Sawyer did not know whether or not he would make the trip. Commodore Hertz will take Pistakee to White Bear. Milwaukee has nothing which she cares to send, I am advised, but some of her men will very likely be on hand. The American navy, both upon the high seas and upon the inland lakes, seems to be having a very busy year. Following is the record of the Oshkosh cup race:

Trophy cup race. One heat.

Open to any and all yachts owned by any organized yacht club of the United States, or by any person a citizen of the United States who shall be a member of and in good standing in any such club.

Time allowance determined according to Herreshoff table.

Racing length formula: L.W.L., plus one-third overhang, plus square root of sail area divided by two, equals racing length.

Rules of Oshkosh Y. C. to govern.

All races start at 1:30 P. M.

Official start, 2:45:15:

Pistakee	2 45 36	2 11 13	2 05 54
Cuttysark	2 45 58	Withdrew.	

First Round.

First Leg.—Wind S. by S.E., strong. 2:49, Pistakee starboard tack. 2:53, Pistakee port tack. 3:04, Avis on starboard tack. 3:07, Avis on port tack. 3:09, Tarpon starboard tack; Iota and Avis also.

Second Leg.—3:22, Iota overhauled Tarpon to windward. Wind S.E., very strong.

Third Leg.—3:29, Iota broke out spinaker. 3:29:30, Tarpon broke out spinaker. 3:33, Kathleen and Gleaner also broke out spinakers. 3:35, Elk came into wind disabled. 3:37, Gleaner in distress; two men overboard. 3:39:30, Gleaner recovered and under way on course. 3:39:35, Pistakee passed Elk. Wind S.E., strong.

Second Round.

First Leg.—4:00, squally; rain; elk quits course and sails to harbor. 4:06, Avis starboard tack; Cuttysark and Wasp now also quit course and sail home; wind E. by S., strong; rain.

Second Leg.—4:18, rain slackens; wind E. by S.

Third Leg.—4:28:30, Iota broke out spinaker; Tarpon also. 4:33, rain. 4:41, Avis jibed for run to home stake; rain falling hard at finish; wind E. by S., very fresh.

Judges, Capt. L. M. Mann, Com. H. L. Hertz.

Avis Wins Neenah Cup Also.

Friday, Aug. 12.—Avis concluded her record on Lake Winnebago by winning the last cup in sight, that of the Nodaway Y. C., of Neenah, for whose course she left Wednesday evening at the conclusion of the Oshkosh cup race. This makes the fourth cup she has won during her week of sailing in these waters, or counting the two heats of the Green Lake cup, five wins in five starts on Winnebago, or ten wins out of the eleven races she has sailed, her only defeat, as earlier stated, being that by her sister boat Ariel. Mr. Thompson may certainly return home with the feeling that he has not overlooked anything which was loose.

The race of Thursday (yesterday), for the Nodaway cup, was won by Avis on her time allowance, her stubborn rival Iota coming in second, though Tarpon and Gleaner finished ahead of both, sailing time. At the start, 2:40 P. M., the wind was light, but freshened. The race was not a procession, but the boats kept well bunched, and did not part company until well at the home stake. A prettier race has not been seen fought out on these waters for many a day. Gleaner, of Oshkosh, and Kathleen, of Neenah, ancient rivals, had another bout, which afforded interest second only to that between Avis and Iota. These two boats sailed neck and neck the whole course. Coming into the home stretch on the last round, Avis fouled the buoy. Protest was filed, but not allowed, it being shown that she was forced to leeward by Kathleen, who came near running her down. The record:

Official start, 2:40:

	Start.	Elapsed.	Corrected.
Gleaner, scratch	2 40 40	2 04 23	2 04 23
Tarpon 7s.	2 40 35	2 03 49	2 03 42
Kathleen, 46s.	2 40 25	2 06 19	2 05 33
Iota, 5m. 19s	2 40 30	2 07 39	2 02 20
Avis, 5m. 19s.	2 40 30	2 05 12	1 59 53

Assembly guns 2:30. Preparatory guns 2:35. Start 2:40.

First Round.

First Leg.—Wind W. by S., very mild; all spinakers out.
Second Leg.—Wind mild and W. by N., fresh.
Third Leg.—Wind W. by N., very fresh.

Second Round.

First Leg.—Wind W., fresh; all spinakers out.
Second Leg.—Wind W., fresh, and W. by N., very fresh.
Third Leg.—Wind W. by N., very fresh.

Winnebago for 1899.

There will be a determined effort made to secure the 1899 meet of the Inland Lake Yachting Association for Lake Winnebago, as indeed might very well be arranged to the pleasure of all concerned. The lake is, as has been earlier stated, big enough and open enough to afford quite as good or better sailing facilities than any of our larger inland waters. The wind averages as steady as on any Western water of equal size, and the shore line is not to be studied so much as in smaller lakes, so that the visitor has an even chance with the local boat. As to the accommodations, they are ample, and the quality of the hospitality of that region needs nothing said to add to a reputation already established.

Other Western Yachts.

In last Saturday's regatta at Oconomowoc Lake, Wis., the wind was puffy and kept the skippers guessing. Bird, owned by F. W. Noyes, of Milwaukee, was first; Meda, W. R. Newhouse, Chicago, second; Hope, G. D. Vandike, Milwaukee, third, the latter scoring a close win over Argo, also of Milwaukee. The race was for season prizes, deferred from July 23. In the afternoon of the same day the boats started again, and again Bird won, Hope second, Meda third.

On Pine Lake, Wis., another of the Waukesha lakes, the regatta of last Saturday, Aug. 6, brought out Nancris, of Milwaukee, first; Arab, Robt. Nunnemacher, second. Francis, disabled. Friar did not finish. O. C. Hanson and H. S. Fuller, judges; Wm. Grau, timekeeper. Record:

	Elapsed.	Corrected.
Nancris, F. Rietbrock	1 17 18	1 15 50
Arab, Robert Nunnemacher	1 18 24	1 16 23

The America Cup.

At a meeting of the New York Y. C. on Aug. 11, called by Commodore J. Pierpont Morgan to consider the cablegram from Secretary Hugh C. Kelly, of the Royal Ulster Y. C., relative to Sir Thomas Lipton's challenge, Secretary Oddie read the following message, dated Aug. 6:

The New York Yacht Club, 67 Madison avenue, New York:

I have to inform you that the Royal Ulster Y. C., on behalf of Sir Thomas Lipton, have the honor to challenge for the America's Cup. Kindly say if this is agreeable to you. A small committee appointed by the club will shortly sail for New York with formal challenge and to arrange details.

Hugh C. Kelly, Sec'y,
Mountpottinger road, Belfast.

The reply, which was sent the same day, was:

New York, Aug. 6.—Hugh C. Kelly, Secretary, Mountpottinger road, Belfast: I have the honor, on behalf of New York Y. C., to acknowledge receipt of cable of even date. Its purport is most agreeable and will be considered as soon as meeting can be called. Your committee will be warmly welcomed.

Oddie, Sec'y.

When the communication had been read, the following resolution, which had been prepared, was unanimously adopted:

The Royal Ulster Y. C. having communicated to this club its intention to challenge for the America's Cup,

Resolved, that the flag officers, secretary and treasurer be and they are hereby appointed a committee with power, on behalf of this club, to accept, under the deed of gift, such challenge for a match for the America's Cup; to arrange the terms thereof and select a yacht to represent this club therein; and, by mutual consent with the challenging club, to make any arrangements as to dates, courses, number of trials, rules and sailing regulations, and any and all other conditions of the match. And the said committee shall have power, in their discretion, to add to their number. Said match shall be sailed under the direction of the regatta committee, pursuant to article 10 of the constitution.

This committee, which will be known as the committee on challenge of the Royal Ulster Y. C., will consist in part, as per the resolution of Commodore J. Pierpont Morgan, of Vice-Commodore Lewis Cass Ledyard, Rear-Commodore August Belmont, Secretary J. V. S. Oddie and Treasurer F. W. J. Hurst. These members met immediately after the club meeting adjourned, and in accordance with the resolution giving to them power to add to their number appointed former Commodore E. D. Morgan and Edward M. Brown, Gen. Charles J. Paine and Herman B. Duryea to assist them in the preliminaries of arranging the details of the challenge, as well as receiving the delegation from the Royal Ulster Club, which it is reported will sail on Aug. 24. Before adjourning the committee drew up the following message, which was cabled to Secretary Kelly before midnight:

Aug. 11.—Hugh C. Kelly, secretary, Mountpottinger road, Belfast: Meeting club held this evening. Your cable presented. A challenge from your club will be most agreeable. Committee appointed with full power to act on challenge and arrange all details. Challenge to be binding and carry precedence must be accompanied by name of owner, certificate, name, rig, and dimensions of challenging yacht, as specified in deed of gift.

Your committee will be warmly welcomed. Vice-Commodore Ledyard sails Etruria, Saturday. Will gladly confer with your committee on his arrival, Liverpool, if you desire. Telegraph him your wishes Queenstown, or Long's Hotel, London.

J. Pierpont Morgan, Commodore.
J. V. S. Oddie, Secretary.

Plymouth Y. C.

Plymouth, Mass.
Saturday, Aug. 6.

The Plymouth Y. C. sailed its third club race on Aug. 6 in a strong west wind, the boats being reefed. Oidono capsized. The times were:

Remora, C. H. Cousens, the leading boat thus far in the knockabout class, was too late to start.

Fall River Y. C. Ladies' Day.

Fall River—Mount Hope Bay.
Wednesday, Aug. 3.

The Fall River Y. C. held a ladies' dav race on Aug. 3, the wind being S.W., moderate. The times were:

	Elapsed.
Columbia, Wood Bros., Fall River	1 07 00
Paprika, Thomas Bros., Newport	1 08 15
Taboo, Noyes Bros., Newport	1 12 03
Snipe, H. L. Flannigan, Fall River	1 22 30
Paradox, W. E. Dodge, Newport	1 25 20

Snipe parted her bobstay before the start and sailed as a cat.

Cape Cod Y. C. Cove Races.

Orleans—Cape Cod Bay.
Saturday, Aug. 6.

The Cape Cod Y. C. sailed the final of the series of Cove races on Aug. 6 in a strong S.W. wind, the times being:

	Length.	Elapsed.	Corrected.
Elise, Capt. Penniman	14.06	1 28 38	0 57 38
Swan, A. T. Newcomb	17.05	1 24 55	0 57 40
Dolphin, O. H. Davenport	15.03	1 27 36	0 58 20
Helen, A. Fulcher	18.01	1 25 10	0 58 39
Little Brave, Geo. Ryder	18.03	1 29 33	1 03 12

The series cup was previously won by Quahog, but as the result of this race Swan takes the first cash prize and Dolphin second.

Eastern Y. C.

An autumn regatta of the Eastern Y. C. will be sailed from Marblehead Rock on Saturday, Sept. 10, unless unfavorable weather necessitates postponement. Open to yachts of any club. All matters connected therewith, unless otherwise specified herein, will be governed by the racing rules of the club. Entries must be received in writing by the regatta committee, at the club house, before 9 P. M. of the evening before the race. "No yacht shall be entered for a race unless her ownership, rig and official measurement are on record with the secretary."—Racing Rule 2. The measurer of the club is Mr. Henry Taggard, at the club house.

Francis A. Seamans, Sec'y,
57 Oliver street, Boston.

Manchester Y. C. Midsummer Series.

Manchester, Mass.

Monday, Aug. 1.

THE Manchester Y. C. finished its midsummer series with two races on Aug. 1, that for the Crowhurst cup in the morning and the open Y. R. A. race in the afternoon. The day was clear, with a fresh E. wind, falling a little before the second race. The Crowhurst cup, a silver trophy costing $250, is given each year by Francis M. Whitehouse, open to yachts of 25ft. l.w.l. and under, Y. R. A. of Massachusetts rules, with time allowance. The course was past Martin's Rock Buoy, Little Haste Buoy, and home, a triangle of 8 miles. The start was made at 11 A. M., Hermes being over the line before the gun and having to recross. The little schooner Bud sailed at her reduced measurement, 21ft., and did very good work, though finally defeated by Duchess on the wind. The times were:

	Length.	Elapsed.	Corrected.
Duchess, Charles Hayden	17.08	1 23 10	0 49 34
Bud, S. N. Small	20.01	1 22 25	0 52 05
Snipe II., Boardman Bros.	21.03	1 23 04	0 53 45
Circe, F. L. Pigeon	16.06	1 30 58	0 55 46
Vamoose, R. M. Benner	17.11	1 29 50	0 56 28
Eleanor, D. B. Clapp	21.00	1 24 24	0 57 50
Typhoon, E. V. R. Thayer	21.00	1 28 20	0 58 45
Hermes, A. W. Chesterton	25.00	1 25 04	0 59 25
Cleopatra, H. M. Faxon	20.10	1 29 27	0 59 41
Little Peter, H. Moebs	24.07	1 25 46	0 59 44
Beatrice, J. Cavanaugh	25.00	1 25 56	1 00 17
Stiletto, R. T. Tucker	14.07	1 38 55	1 00 20
Mongoose II., J. D. Irving	21.00	1 31 57	1 02 22
No. 10, Boardman Bros.	14.07	1 44 50	1 06 15
Piccola, E. V. R. Thayer	14.07	1 48 22	1 09 49
Witch, N. Wigglesworth	14.07	1 48 23	1 09 48

The afternoon race had a larger field of starters, though only Meemer was at the line in the 30ft. class. She, with the raceabouts and the 25ft. class, sailed the same triangle as in the former race. The 21ft. and the 18ft. classes sailed a triangle marked by Baker's Island and the Haste Buoy; and the 15-footers sailed a smaller triangle, by Baker's Island and Bowditch Ledge. The wind was lighter than in the morning, but still enough to make a race, in spite of some soft spots. The start was made at 2:30 P. M. Jilt sailed a fine race, but picked up some seaweed on her rudder near the finish, which threw her into second place. The times were:

30ft. Class.

	Elapsed.
Meemer, R. C. Nickerson	1 46 02

25ft. Class.

Hermes, A. W. Chesterton	1 56 03
Beatrice, J. Cavanagh	1 58 04
Little Peter, H. Moebs	1 59 56
Eleanor, D. B. Clapp	2 02 41

Raceabout Class.

Fancy, C. F. Lyman	1 57 42
Jilt, W. O. Gay	1 58 39
Mongoose, J. D. Irving	2 00 01
Tunipoo, J. L. Brewer	2 02 57
Typhoon, E. V. R. Thayer	2 04 26
Gosling, Clark & North	2 04 36
Hazard, H. M. Sears	2 14 00

21ft. Class.

Cleopatra, H. M. Faxon	1 45 57
Bud, S. N. Small	1 46 29
Snipe II., Boardman Bros.	1 46 45
Fesit, N. R. Blaney	Withdrew.

18ft. Class.

Duchess, Charles Hayden	1 41 00
Vamoose, R. M. Benner	1 47 42
Circe, F. L. Pigeon	2 05 45

15ft. Class.

Stiletto, R. F. Tucker	1 05 45
Jag, J. S. Lawrence	1 05 48
No. 10, Boardman & Sears	1 09 20
Atom, F. L. Ames	1 11 07
Witch, N. L. Wigglesworth	1 12 51
99, Boardman Bros.	1 14 35
Freak, E. C. Fitch	Withdrew.

Some remeasurements are necessary to determine all of the winners. Cash prizes were offered in each class, with the Y. R. A. percentages. The races were managed by Messrs. G. W. Mansfield, A. H. Higginson, W. A. Tucker and James Bertram.

The Flying Proa.

THE very interesting article in FOREST AND STREAM of Aug. 6 has prompted me to quote from two early descriptions of the famous proa. The quotation from Dampier is exact, taken from first edition of his "Voyages," London, 1697.

Writing in 1686 at the island Guam, one of the Ladrone group lately taken under our flag, Dampier gives a full description of the proa and her performances:

"The natives are very ingenious beyond any people in making boats, or procs, as they are called in the East Indies, and therein they take great delight. These are built sharp at both ends, the bottom is of one piece, made like the bottom of a little canoa, very neatly dug and left of a good substance. This bottom part is instead of a keel. It is about 26 or 28ft. long; the under part of this keel is made round, but inclining to a wedge and smooth, and the upper part is almost flat, having a very gentle hollow, and is almost a foot broad. From hence both sides of the boat are carried up to about 5ft. high, with narrow planks, not above 4 or 5in. broad, and each end of the boat turns up round very prettily. But what is very singular, one side of the boat is made perpendicular, like a wall, while the other side is rounding, made as other vessels are, with a pretty full belly. Just in the middle it is 4 or 5ft. broad aloft, or more, according to the length of the boat. The mast stands exactly in the middle, with a long yard that peeps up and down like a mizzen yard." This comparison was made before the lateen mizzen yard was displaced by the spanker gaff. "One end of it reacheth down to the end or head of the boat, where it is placed in a notch that is made there purposely to receive it and keep it fast; the other end hangs over the stern. At the foot of the sail there is another small yard to keep the sail out square, and to roll up the sail on when it blows hard. It serves instead of a reef to take up the sail to what degree they please, according to the strength of the wind. Along the belly side of the boat, parallel with it, at about 6 or 7ft. distance, lies another small boat or canoa, being a log of very light wood, almost as long as the great boat, but not so wide, being not above a foot and a half wide at the upper part, and very sharp like a wedge at each end. There are two bamboas of about 8 or 10ft. long and as big as one's leg placed over the great boat's side, one near each end of it, and reaching about 6 or 7ft. from the side of the boat. By the help of which the little boat is made firm and contiguous to the other. These are generally called by the Dutch, and the English after them, outlayers." Did the word outrigger come into our language in this way? "The use of them is to keep the great boat upright from oversetting, because the wind here being in a manner constantly east, or if it were at west it would be the same thing; and the range of these Islands, where their business lies to and fro, being mostly north and south, they turn the flat side of the boat against the wind upon which they sail, and the belly side with its little boat is upon the lee. When they ply to windward and are minded to go about he that steers bears away a little from the wind, by which means the stern comes to the wind and is now become the head only by shifting the end of the yard. This boat is steered with a broad paddle instead of a rudder. I have been the more particular in describing these boats because I do believe they sail the best of any boat in the world. I did here for my own satisfaction try the swiftness of one of them. Sailing by our log we had 12 knots on our reel, and she did run it all out before the half-minute glass was half out, which, if it had been no more, is after the rate of 12 miles an hour; but I do believe she would have run 24 miles an hour. It was very pleasant to see the little boat running along so swift by the other's side."

This last sentence is worthy of Pepys, and it is a curious fact that Pepys and Dampier were friends, or at least acquaintances.

John Evelyn records in his diary, under date of Aug. 6, 1698: "I dined with Mr. Pepys, where was Capt. Dampier, who had been a famous buccaneer. He seemed a more modest man than one would imagine by the relation of the crew he had assorted with."

In the quarto edition of "Lord Anson's Voyage," London, 1749, there is a very full and clear description of a proa. When the Centurian reached Tinian, one of the Ladrone group, her people captured a proa, which Mr. Brett, one of the officers, took entirely to pieces and made accurate measurements of all her parts. A fine scale draft of this proa is in Anson, seems clear enough to build from, and ought to be reproduced in FOREST AND STREAM. From ranges taken overland while ship was at Tinian, Anson's people figured speed of proas at about 20 miles, on the wind. This account in Anson also refers to experiments made at Portsmouth, England, with a proa built there, and speaks of wonderful speed shown. Dampier places the outrigger on lee side; all other descriptions to windward.

A. C. STOTT.

STOTTVILLE, N. Y., Aug. 8.

Editor Forest and Stream:

I was deeply interested in Vieux Moustache's description of the flying proa, and therefore its confusion of terms was exasperating. He says, "The port side" (what is the port side of a double-ender?) is "bellied or rounded out, while the lee side is as flat as boards can be." Again he says that the "flat side remains always the weather one." Now which side is the flat one—lee or weather? His drawings shed no light on this darkness, and the chapter on "The Evolution of the Yacht" in Yachts and Yachtsmen of America gives no information. The outrigger side is the windward one, of course, but is this on the straight or elliptical side of the proa?

We have had catamarans here on the half-hulls principle recommended by Vieux Moustache, but they were not fast.

J. L. STEWART.

The Newport 30-Footers.

Aug. 1.—Sweepstakes, Jamestown course, 12 miles. Wind light S. E. Start 2:29:

	Finish.	Elapsed.
Hera, R. N. Ellis	4 30 20	1 31 20
Wawa, R. Brooks	4 34 58	1 35 58
Carolina, P. Jones	4 35 34	1 36 34
Dorothy II., H. P. Whitney	4 36 20	1 37 20
Vaquero III., H. B. Duryea	4 40 47	1 41 47
Puck, E. D. Morgan	4 41 30	1 42 30

Aug. 2.—Dyer's Island course, wind light S. W. Start 2:51:

	Finish.	Elapsed.
Veda, C. Vanderbilt Jr.	6 11 15	3 20 15
Hera, R. N. Ellis	6 12 02	3 21 02
Dorothy II., H. P. Whitney	6 12 37	3 21 37
Vaquero III., H. B. Duryea	6 14 05	3 23 05
Carolina, P. Jones.	Did not finish.	
Wawa, R. Brooks	Did not finish.	

Aug. 3.—Sweepstakes, Jamestown-Bishop's Rock course, 16 miles. Wind light S.

	Elapsed.
Vaquero III., H. B. Duryea	2 15 41
Carolina, P. Jones	2 17 00
Hera, R. N. Ellis	2 17 35
Veda, C. Vanderbilt, Jr.	2 18 15
Wawa, R. Brooks	2 20 42
Puck, E. D. Morgan	2 25 47

Aug. 4.—Whitney cup. Dyer's Island course. Strong S.W. wind. Start 2:56:

	Finish.	Elapsed.
Carolina, P. Jones	4 06 03	2 10 03
Hera, R. N. Ellis	4 06 25	2 10 25
Vaquero III., H. B. Duryea	4 06 37	2 10 37
Wawa, R. Brooks	4 10 46	2 14 46
Veda, C. Vanderbilt, Jr.	Did not finish.	

Veda carried away the jaws of her gaff and withdrew.

Aug. 5.—Sweepstakes, Bishop's Rock course, eight miles. Wind N.W., light and variable.

	Elapsed.
Vaquero III., H. B. Duryea	1 26 04
Dorothy II., H. P. Whitney	1 22 28
Wawa, R. Brooks	1 28 32
Hera, R. N. Ellis	Did not finish.
Carolina, P. Jones	Did not finish.

Carolina and Hera were in collision at the mark, both withdrawing.

Aug. 6.—Stillman cup. Dyer's Island course. Wind S.W., moderate.

	Elapsed.
Veda, C. Vanderbilt, Jr.	2 32 40
Dorothy II., H. P. Whitney	2 33 09
Carolina, P. Jones	2 33 21
Wawa, R. Brooks	2 36 02
Puck, E. D. Morgan	2 36 35
Vaquero III., H. B. Duryea	2 38 02
Hera, R. N. Ellis	Did not finish.

The 15-footers sailed a race for the Thomas pennant, to be held by the yacht winning it twice. The course was a triangle of 8 miles, the times being:

	Elapsed.
Paprika, Thomas Bros.	1 21 00
Taboo, E. Dodge	1 34 00
Paradox, Noyes Bros.	1 39 00
Osprey, R. Vanderbilt	Did not finish.

Aug. 8.—Sweepstakes. Bishop's Rock course. Start 3:04:

	Elapsed.
Puck, E. D. Morgan	1 59 10
Hera, R. N. Ellis	1 59 22
Vaquero III., H. B. Duryea	2 00 19
Wawa, R. Brooks	2 01 02
Carolina, P. Jones	2 02 03
Asahi, L. Warren	2 04 21
Veda, C. Vanderbilt, Jr.	2 08 28
Dorothy II., H. P. Whitney	Did not finish.

Dorothy fouled the mark and withdrew.

The record of the class for July, during which month twenty-two starts were made, only one race being abandoned on account of fog, is as follows:

	Firsts.	Seconds.	Thirds.
Vaquero III.	6	5	3
Carolina	5	4	5
Veda	4	1	1
Hera	3	3	4
Dorothy II.	2	5	1
Wawa	1	3	3
Puck	0	0	4

There were five cup races, Vaquero III. winning two, the Narada and Brooks cups; Veda and Dorothy II. the N. R. A. cups, and Carolina the sweepstake cup. The full record of the boats is as follows:

Seawanhaka Corinthian Y. C.

NEW YORK, Aug. 10.—The first prize offered by Commodore Rouse for the racing cruise to New London, and won by his yacht Mistral, was returned by him to the club, and is again offered for a race to Indian Harbor, Greenwich, Connecticut and return, on the following conditions:

Course.—From west to east across the starting line between two stake boats anchored off the club house float, to and around Center Island buoy, leaving it on the port hand, thence to and around Matinicock Point buoy, leaving it on the starboard hand, thence passing between the channel buoys at the entrance to Greenwich Harbor, across the finish line between the two stake boats anchored off the club house of the Indian Harbor Y. C.

Start.—One-gun, promptly at 10 o'clock A. M.

After the finish of the morning run an interval will be allowed for luncheon at the club house of the Indian Harbor Y. C., and the captains will then agree as to the hour of the return to Oyster Bay, which will be made over the same course.

The prize will be awarded to the yacht making the best accumulative time on the two runs.

The Indian Harbor Y. C. has courteously offered the privileges of their club house, and provided for the placing of mark boats and the taking of time at the finish of the morning run.

Entries.—Entries should be made in writing, addressed to the race committee, on or before Friday, Aug. 19.

The Corinthian Y. C., of Philadelphia, has been specially invited to participate in this race with its fleet of seven knockabouts, which will be at Oyster Bay prepared for the match between that club and the Seawanhaka Club, beginning on Monday, Aug. 22.

The race committee takes the opportunity to announce that J. Rogers Maxwell, Esq., has offered the following cash prizes for the three leading knockabouts at the finish of the inter-club match race on Aug. 22, viz.: $25 to the first boat; $15 to the second boat; $10 to the third boat.

CHARLES A. SHERMAN, Sec'y,
64 Leonard street, New York.

Manchester Y. C. 15ft. Class.

THE 15ft. class of the Manchester Y. C. sailed the second race of the Chubb cup series on Aug. 2 in a light and variable wind, the times being:

	Elapsed.
Stiletto, R. F. Tucker	1 26 05
"00," Brown & Boardman	1 26 15
Jag, J. Lawrence	1 26 24
Piccola, E. V. R. Thayer	1 26 30
No. 10, Boardman & Sears	1 30 30
99, Boardman Bros.	1 30 45
Atom, Ames Bros.	1 30 55
Freak	Withdrew.
Witch	Withdrew.

On Aug. 3 a special race was sailed in a fresh S.W wind, the times being:

	Elapsed.
Stiletto, R. F. Tucker	1 14 19
Freak, J. F. Lawrence	1 16 12
Witch, N. Wigglesworth	1 21 07
No. 10, R. Boardman & F. R. Sears	1 21 57

Judges: W. A. Tucker and R. Tudor. Prizes: $7, $5 and $3.

Hull Mosquito Y. C.

Hull—Boston Harbor.

Saturday, Aug. 6.

THE Hull Mosquito Y. C. sailed its fourth race on Aug. 6 in a strong N. W. wind, the times being:

First Class.

	Length.	Elapsed.
Idler, Noyes	20.00	1 07 25
Sheyessa, Douglas	18.06	1 12 20
Gobelin, Canterbury	17.06	1 13 50

Ripple, Charles Howard Smith	15.05	1 23 00
No Name, P. F. Folsom	16.00	1 24 20
Rita, Charles W. King	15.02	1 25 45
Esefsee, George Smith	....	1 27 30

Corinthian Y. C. of Marblehead Midsummer Series.

Marblehead—Massachusetts Bay.

Aug. 3, 4, 5, 6.

THE midsummer series of the Corinthian Y. C. of Marblehead has been one of the events of the season in Eastern waters since the infant days of the club, when the forties were in their glory and Minerva and the Burgess boats fought some hard battles over the Marblehead courses. This year the club was in luck, as the weather was good—for Marblehead. As soon as the negotiations for a cup race have progressed a little further the advantages of Marblehead will be set forth in glowing terms by some of the Boston papers, as in past years. In view of this certainty, it is interesting to consider the weather which has prevailed there this season, spoiling a number of races. On three out of four days of August, however, the weather, though far from perfect, was such as to make it possible to sail each race with no postponements and reasonably satisfactory results. There was a very good fleet, both in point of numbers and in quality, though the larger classes did not show up as large fields of starters as the occasion warranted. In the 15ft. class there was some hot rivalry and close racing between the fleets of Manchester and Squam, the honors of the sail-off going to the former. The series included three "invitation races" and an open race on Saturday.

FIRST INVITATION RACE.

Wednesday, Aug. 3.

On Wednesday the wind was from the east, light to moderate, with clear weather. The course for the 30ft., 25ft. and raceabout classes was from off the club house at Marblehead Neck past Half-Way Rock and the Pigs Bell Buoy, 10 miles naut.; for the 21 and 18ft., with the knockabouts and the 15-footers, sailed past Gooseberry Ledge and Bowditch Ledge, 6½ miles. The new 25-footer Cartoon was on the ways at Stearns' yard, where 1,100lbs., about half of her lead bulb, was removed, under the direction of Mr. Gardner, her designer, in order to get her up to the class limit of 25ft. l.w.l. The start was was made at 1 P. M. The final times were:

30ft. Class.

	Elapsed.
Ashumet, C. Fred Bache	1 44 30
Harbinger, W. F. Bache	2 02 54

25ft. Class.

Hermes, A. W. Chesterton	1 55 20
Bud, S. N. Small	1 56 05
Eleanor, D. B. Clapp	1 58 46
Nettie, W. Burgess	2 01 04
Sally IV., L. F. Percival	2 01 18
Beatrice, J. Cavanagh	2 02 12

21ft. Class.

Duchess, C. Hayden	1 15 10

18ft. Class.

99, G. E. Boardman	1 40 58
Atom, F. L. Ames	1 41 24
Imp, Oscar Perkins	1 42 09
00, Boardman & Brown	Withdrew.

Stiletto finished in fourth place, but was not seen and timed owing to a larger boat covering her on the line.

SECOND INVITATION RACE.

Thursday, Aug. 4.

On Thursday the wind played one of its mean tricks, there being little of it and what there was from all quarters, making a most unsatisfactory race. The start was made at 1 P. M. with a light east wind, but this was soon followed by a calm, broken at intervals by stray puffs. The times were:

30ft. Class.

	Elapsed.
Ashumet, C. F. Bache	3 01 44
Harbinger, W. F. Bache	3 35 02

25ft. Class.

THIRD INVITATION RACE.

Friday, Aug. 5.

Friday proved anything but an unlucky day, in spite of a dreary N.E. rainstorm in the morning, which lasted until almost 1 o'clock, when the wind shifted to N.W., blowing a reefing breeze, and the sky cleared suddenly. The start was made at 1:15 with a smaller fleet, the storm having kept away some of the boats from Manchester and other points. The times were:

Cartoon carried away here "nasty" rudder and was towed in.

The winners of the series, subject to remeasurement in some cases, were: 30ft. class, Ashumet; 25ft. class, Hermes, Bud and Sally IV., each one leg; 21ft. class, Duchess; 18 ft. class, Katydid; raceabout class, Jilt; knockabout class, Polly; and 15ft. class, Schatz and Jag to sail off.

OPEN RACE.

Saturday, Aug. 6.

The wind was all right on Saturday for the open race, a fresh N.W. breeze, almost of reefing strength toward the finish. The start was made at 1 P. M. Saunterer sailed her first race in the 30ft. class. Jag won the sail-off in the 15ft. class. Lynx did not start owing to the decision of the committee over her changes of ballast during the races. The times were:

The Quincy Challenge Cup.

THE details of the matches for the Quincy Y. C. cup, between representatives of the Quincy and Lynn clubs, call for the first race on Monday, Aug. 22, starting at 1 P. M. The second race will be started at 2 P. M. on Tuesday and the third at 3 P. M. on Wednesday. If further races are necessary they will be started at 3 P. M. on successive days. The time limit will be three hours and thirty minutes. Each party will name one judge, these two selecting a third. Sec'y James S. Whiting has been named by the Quincy Y. C.

Beverly Y. C.

Marion—Buzzard's Bay.

Saturday, Aug. 6.

THE Beverly Y. C. sailed two races off Marion on Aug. 6, one in the morning, starting at 11 A. M., for the Van Rensselaer memorial cup, and one of the regular series races in the afternoon, starting at 2 o'clock. The first race was sailed in a strong S.W. wind, freshening until the boats were compelled to reef, Capelin losing her aluminum mast. Near the finish the wind shifted to N.W., and the afternoon race was sailed in a fresh breeze from that quarter. The times were:

Wollaston Y. C. Open Race.

Quincy—Boston Harbor.

Saturday, Aug. 6.

THE Wollaston Y. C. sailed its first open race on Aug. 6 in a strong N.W. wind, coming in puffs and hitting hard. Before the start the 15-footer Sparrow lost her mast, and during the race, when doing well with the schooner Bud, Elsa broke her hollow mast, the end falling and piercing the deck. The times were:

Muriel, J. L. Smith	Did not finish.

The judges were: Messrs. Charles W. Page, Arthur C. Gardner, William M. Chase, Henry A. Newman, Frank P. Waterhouse and James Bertram.

The day finished with a number of amusing water sports.

Burgess Y. C. Open Race.

THE second attempt of the Burgess Y. C. of Marblehead to sail its open race, on Aug. 1, was abandoned for lack of wind. Twenty-five boats started, but all withdrew, as they could not finish within the time limit.

Answers to Correspondents.

No notice taken of anonymous communications.

A. B. H., New York.—Is there any electric hunting jack on the market adapted for use in "shining deer" at night? Ans. We know of none.

R. L. P., Lake Luzerne, N. Y.—The Tribune's statement of the game law is incorrect, as you will learn by reference to the Game Laws in Brief mailed you.

Subscriber, Dillingersville.—Please inform me through your valued paper if the fish called sea trout are a salt or fresh-water fish and oblige. Ans. The sea trout of Canadian waters are anadromous, like the salmon and the shad. They are taken in midsummer when they come from the sea into the rivers.

PUBLISHERS' DEPARTMENT

THE Dr. Jaeger Co. received many valuable recommendations of their elastic abdominal bandages, a large quantity of which they furnished free of charge for distribution among our soldiers in the field. Many medical authorities gave their approval of the action and have written favorably in regard to the benefit derived from the wearing of these bandages in the regions where fever attacks so many thousands of our sons.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, AUGUST 27, 1898.

VOL. LI.—No. 9. No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

PRIZES FOR AMATEUR PHOTOGRAPHS.

THE FOREST AND STREAM offers prizes for meritorious work with the camera, under conditions which follow:

The prizes will be divided into three series: (1) for live wild game; (2) for game in parks; (3) for other subjects relating to shooting and fishing.

(1) For live game photographs three prizes are offered, the first of $50, the second of $25, and the third of $10.

(2) For live game in parks, for the best picture, a prize of $10.

(3) For the best pictures relating to FOREST AND STREAM'S field—shooting and fishing, the camp, campers and camp life, sportsman travel by land and water, incidents of field and stream—a first prize of $20, a second of $15, a third of $10, and for fourth place two prizes of $5 each.

There is no restriction as to the time nor as to where the pictures have been made or may be made.

Pictures will be received up to Dec. 31 this year.

All work must be original; that is to say, it must not have been submitted to any other competition or have been published.

There are no restrictions as to the make or style of camera, nor as to size of plate.

A competitor need not be a subscriber to the FOREST AND STREAM.

All work must be that of amateurs.

The photographs will be submitted to a committee, who, in making their award, will be instructed to take into consideration the technical merits of the work as a photograph, its artistic qualities, and other things being equal, the unique and difficult nature of the subject.

Photographs should be marked for identification with initials or a pseudonym only, and with each photograph should be given, answering to the initials, the name of sender, title of view, locality, date and names of camera, and plate or film.

FORESTS THREATENED.

NOT very long after the final establishment of the forest reservations and the passage of the deficiency appropriations to pay the expense of forest inspectors and forestry and other emergency help, comes an example of the benefit to the Western country of this agitation. Raids on the Western forests have been so much a matter of course in the past that it is not to be expected that they will cease at once. Yet it is altogether probable that hereafter, where such raids are brought to the notice of the public, or of the authorities, those who contemplate making them may—in view of the present interest in the subject—pause before carrying out their intended ravages on the public domain.

Some little time ago it was learned that the Rock Springs Lumber Company, of Wyoming, was preparing to cut an immense quantity of saw logs, railway ties and mining timber on the head of Green River, in Wyoming, and this without any permit from the Government. The Rock Springs Lumber Company had already cut timber in the same general region, and their course then indicated that they would bear careful watching. They did not keep the refuse of their cuttings cleared up as the law requires, and serious forest fires would be certain to follow their choppings, as we are told they have followed them before. Until recently there were camped on the head of Green River and in that neighborhood about one hundred Mormons, men, women and children, who expected to work at getting this timber out. They had in their company three professional hunters, engaged to kill game for the camp. They were to have four permanent camps there, and the choppers had been told that it would be an all winter's job. All preparations seem to have been made for a vigorous campaign against these forests.

The country intended to be cut over included Townships 38 and 39, N. Range 110 W., and the same townships in Range 111 W. It lies on both sides of Green River, in Fremont and Uinta counties, and about sixty or seventy miles south of the National Park. Large timber is not very abundant there, it being estimated that the amount of saw timber on the head of Green River does not exceed 3,000,000ft., as most of the trees are lodgepole pines. As reported, the plans of the lumber company were to cut out all the saw logs and such of the smaller timber as was fit for railroad ties and mining props.

If this country were to be cut over in the way indicated, nothing could prevent fire from starting there, and once started it would very likely sweep the entire west side of the range, and might even go as far as the Yellowstone National Park. The Rock Springs Lumber Company had a public timber permit which expired March 21, 1897, and which had not been renewed up to the early part of the present year. Employees of the company stated recently that their permit had not been renewed, but nevertheless they seemed to be preparing to go ahead and cut without a permit.

Very recently, however, the Rock Springs Lumber Company seem to have seen a great light. The news of their intentions got abroad and the authorities at Washington were notified of what was likely to happen. Up to about three weeks ago the force of choppers were encamped on the head of Green River, waiting, as for several weeks they had waited, for the employees of the lumber company to come and set them to work. These employees never came, and at last the choppers, thoroughly discouraged, went away, cursing the company and all connected with it.

The project appears to have been one of the wholesale timber raids that have long been common in the West, and which will continue just so long as the authorities permit. It is a cause for satisfaction that this one has not taken place. That the United States is to be deprived of a few millions of feet of timber is perhaps not in itself a matter of great importance, but that a wide tract of mountain country is first to be deprived of all its large trees, and then to be burned off, is of high importance. This timber is needed to conserve the water supply of an important section of the arid West, and it should be protected.

Two classes of people are nearly affected by this matter: those interested in forest preservation, including the local farmers and stockmen, whose hay, gardens and other crops are threatened by drought; and those interested in game preservation. Besides protecting the water supply of Green River and many of its tributaries, from which the settlers derive the water for the irrigation of their crops, these forests also afford shelter to the large game of one of the best game countries in the United States. The burning over of this section would for a time seriously contract the range of the large game of Wyoming, and so tend to deprive that State of the very considerable revenue brought into it annually by hunters from a distance. The subject ought to impress itself strongly on all residents of that State and on their representatives in Congress.

SNAP SHOTS.

The energy and success of the Wellington Acclimatization Society might well be emulated by some protective associations in this country. This society was established in 1886 for the purpose of introducing, acclimating and domesticating useful or ornamental forms of life in New Zealand. Its membership is drawn from subscribers, or from persons who take out licenses to shoot or fish, and is large. Its financial condition is good, its expenditures last year having amounted to about $8,000 and its receipts to nearly $9,000. It has distributed in various parts of the island of New Zealand red deer, pheasants, hares, California quail, some species of European partridges and wild ducks, and many sorts of game fish, chiefly salmon and trout. It has established game farm reserves, where birds—chiefly pheasants—are bred, and these as they grow up are being distributed and turned out in various parts of the island. It has met with occasional discouragements, vermin and brush fires having from time to time destroyed large numbers of the birds that it was protecting. It has a number of fish hatcheries which are in successful operation, and it distributes and sells fish ova in large quantities. What the Wellington Society has done does not satisfy it, and it is continually doing more. It is strongly supported by the public opinion of the island, and if its popularity increases, as no doubt it will, there is good reason to believe that in the course of a few years this island, originally almost barren of game, will afford good sport to the lover of angling and shooting. The Government of New Zealand is heartily in sympathy with the work of the Wellington Society, and contributes through a variety of ways to its success. This Society is only one of a number in the island, and all of them are doing good work.

The press announcement of the successful ascent of the Grand Teton, by a party of Wyoming climbers, will be of great interest to all persons who take pleasure in mountaineering in the West. The Grand Teton is the principal peak of the Teton range, which, running nearly north and south, separates two important branches of the Snake River, the waters of the Jackson Hole Valley in Wyoming from those of Pierre's Hole in Idaho. Many previous attempts have been made to reach the summit of this peak, but none have been successful. It has not been easy to find the real summit of the mountain, and this, when found, has hitherto proved impracticable of ascent. In 1863 Michaud attempted the Grand Teton, in 1872 Stevenson and party, in 1876 Wilson and Yount, in 1877 Cooper; later Mr. Holmes, of the Geological Survey, tried it, and in 1891 Owen and Dawson, and again in 1897 Owen. None of these attempts were successful, though Stevenson claimed to have reached the summit. This summer Mr. W. O. Owen, State Auditor of Wyoming, with a persistence worthy of a true mountaineer, made another attack on the mountain. His companions were Frank Spalding, of Denver; St. John Shive and Frank Peterson, and at 4 o'clock P. M. of Aug. 11 the party reached the summit, where they built a monument and took some observations. The ascent is said to have been made from the Saddle, thence up the west face north of the Icy Niche. The aneroid barometer indicated 13,800ft. at the summit. The ascent of this superb mountain is a real triumph for those who made it, and for the Rocky Mountain Club, under whose auspices it was made. The many readers of FOREST AND STREAM who have hunted in the neighborhood of the Grand Teton, or who have viewed its mighty mass from commanding points in the Yellowstone Park, can appreciate better than most people how proud a feat Mr. Owen and his companions have accomplished.

Many sermons have been preached as to carelessness with firearms, and many examples cited to point the moral of such sermons, but none of these has been sadder than the last that comes to us. At White Lake, near Forestport, N. Y., on the Mohawk and Malone Railroad, a hunter mistook his sixteen-year-old son for a deer and shot him, so that he died in a short time. It is said that a few years ago another son of the same man was shot and killed, being taken for a bear. That occurrences such as this are possible in these days seems at first incredible, yet that they happen so often ought to impress on every man who goes hunting or shooting the fact that firearms are of a truth deadly weapons, dangerous alike to him who carries them and to others who are within their range. Most of us wonder how it is possible for a man carrying a gun to shoot another, yet many a careful sportsman of long experience can recall one or more cases where, through carelessness or misconception, he either came near to shooting one of his companions or was himself nearly shot by some one else. The more experience one has with firearms the more he learns to fear them, and to be careful with them. Yet even so, unceasing watchfulness is demanded of the man who uses a gun.

Over much of the country the last days of August mark the end of the close season for feathered game. The rail season opens now, and with the advance of autumn it becomes lawful to shoot other birds. In the East we hear little of illegal shooting, chiefly perhaps for the reason that birds are so few. The case is different in the Middle West, however, where the young grouse and the scarcely fledged ducks have for weeks been slaughtered by selfish people, whose eagerness to get ahead of their neighbors wholly perverts their sense of right and wrong.

The Sportsman Tourist.

The Falealili Cavern in Samoa.

In a country of limestone formation caves are no great rarity, but in volcanic rock they are small and infrequent. The geologist recognizes at a glance that the volcanic upheavals which raised the Samoan islands out of the Pacific are of very recent date, as time goes when it is chronicled by the rocks. So lately have the now extinct craters been actively engaged in building the land that the eroding forces have not had time to wear off the sharp edges of ridges and valleys, and the luxuriance of the timber which clothes the mountains from sea to summit is due to the extreme richness of the basic lava and the humus rather than to the depth of the soil. Under such conditions the known caves in Samoa are few in number and of limited extent. The islanders are content with the knowledge that there is a hole in the ground, its extent and its possible contents they are quite willing to leave in the list of things unknown. Devoured by an insatiable curiosity in all other matters, they are not in the least curious in the matter of caves. They have all been converted within the last half-century and pride themselves on their rapidity in the attainment of civilization. They boast of their complete rejection of their ancient paganism and all its works, the old gods they cheerfully call devils. But when you get right at the milk of their particular cocoanot they live in a state of terror as to these ancient devils whom they know they have mortally offended. Their new Christianity will not allow them to placate the old gods, the only thing they can do is to keep away from every chance of encountering the devils in the bush, and particularly in the few caverns which they are known to inhabit. Most of these caves are mere overhanging cliffs from which the light is excluded by the dense growth of the jungle, without depth enough to keep the rain off an ordinary demon; but they are deep enough for Samoan tales of terror fit to scare the children and the elders as well.

The most perfect specimen of cave formation in all Somoa seems to have escaped the knowledge of the Samoans altogether, and to have first been discovered by the white men. At least the islanders, while convinced that it would be a most comfortable abiding place for demons, have no stories of any devil in particular who makes it his habitation, and in fact give it no name except that of the Cave of Torches, which is merely descriptive of one necessity in its exploration.

There is indeed one story told about this cave. The inhabitants of the villages near by tell of a runaway match assisted by this cavern. A flash young chief of Falealili was engaged with the charms of the "taupou" or maid of the village of another town, but the accounts vary as to whether this was a town to the west or to the east, or even on that coast at all. With several canoes filled with his retinue he paid a ceremonial visit to the lady's town, bringing the wooing presents. Either he was too niggard with the gifts of courtship, or else his business manager and the elders failed to agree on the number of the wedding gifts which the chief must pay; at any rate he stole the girl by force, to which she seems to have been not in the least averse. He popped her into his canoe and paddled away to Falealili. When the girl's townsfolk came in prompt pursuit the maid of the village had vanished, and was not produced until the negotiations had been concluded on terms most favorable to the suitor. Then he brought out his bargain, who had been concealed in this cave.

Falealili is quite a populous center of civilization, as such things go in Samoa, for there are three houses built of boards, and inhabited by one Englishman and two half-castes, all trading in copra for several factors in Apia. It lies on the south coast of Upolu, what they call down there "on the back of the island." From Apia it is in air line distance about twenty-five miles, but nothing can travel that way through the tangle of the bush and over the saw-like spurs of steep mountains except the spike-tailed bosun birds which may often be seen high in air flying directly across the island. To reach it by water takes not less than two days, and frequently a week, all depending on ability to work to windward against the southeast trade. Its importance, and any place in the South Sea is important which can support three traders, is due to the conformation of the country. For some distance on either side the ground has an easy slope for several miles back to the mountain ranges, which elsewhere break sharp off in cliffs toppling over the sea. This slope is covered with groves of cocoanuts of which the dried meat is the article for which traders exchange cloth and corned beef, and knives and beads. Here the Samoans pitched upon the site of several villages, both because of the fertile soil at the back and the excellent bay and passage in the reef, which would attract any aquatic race such as these islanders.

That the Falealili cavern is known at all is due to the interest of Mr. Evans, the English trader. He not only discovered it, but he feels convinced that it has a medical value, and for that purpose himself and his family frequently visit it. On the rare occasions when a traveler comes to Falealili he enjoys the hospitality of Mr. Evans, and as part of the entertainment a trip is made into the cave. People in civilized communities, where calls are paid and friends are constantly meeting one another, have no idea of what a pleasure it is to a South Sea trader living off by himself alone with the natives to see a white face, whether familiar or strange. Of what he has nothing is too good for the traveler, and the trader's great regret at the coming of the stranger is that he must also go. Whoever stops with the trader has been in Apia lately and he brings news, perhaps he has been out in the great world, and then his news is all the more interesting. In return, Trader Evans extends a generous welcome and exhibits the natural wonders of his cave, a thing which would be well worth seeing anywhere.

It is in the bush about a mile and a half back from the beach, and the mouth is about 500ft. above tide. From the beach there is a path as well marked as any in the Samoan bush. It extends away back into the hills and follows a line of stone wall such as is to be found everywhere in the mountains of Upolu. These paths and walls are of great antiquity, and certainly antedate the great dispersal of the races of the Pacific, which took place about 1000 A. D. A side path leads off from this, and after you have scrambled through the tangled grasses underfoot and have cut through the lianas hanging down from the overarching trees, and through great clumps of bamboo, you come after a few rods of this sort of traveling to the mouth of the cave. The hillside just here slopes very gently, and in the nearly level ground is a funnel-shaped depression some 60ft. in diameter, with a depth of 20ft. The rim of the bowl is kept in shape by the roots and buttressed trunks of trees, and the slope is covered with herbage, except where bare rocks of basalt crop out. One such is at the bottom of the depression, and under that opens black and contracted the orifice through which you are to squeeze into the cave. Mr. Evans always contrives to make his trips to the cavern as jolly as possible by taking his wife and small children, and all the Samoan boys and girls he can pick up on the way, for though they would rather be shot than go in alone, they are glad to go in with white people, who can secure them against the devils. The white people in the party prepare for the exploration by dressing in the native costume of a strip of cloth clouted about the waist, with the addition of a pair of shoes, since few white men can walk on jagged rocks with such unconcern as do the Samoans. The only thing needed is a torch, and these Mr. Evans prepares with much ingenuity. From the nearest clump of bamboo he cuts several stems and selects the portion which has a diameter of about an inch. With that diameter the interval between knots in the Samoan bamboo is from 15 to 18in. He cuts the stalks so as to get all of one joint, leaving the partition at the bottom, but cutting off the upper one. Filling this tube with kerosene and stuffing the end with a plug of native cloth, which is made of a bark fiber and serves excellently as a wick, he provides a torch as convenient as could well be devised.

At the mouth of the cave there is perceptible a slow indraught of the warm exterior air. There is just room in the hole to work through feet foremost. As soon as your head is within you find that you are at the top of a very steep slide of earth and rock, which seems to account for the funnel-shaped depression in the surface. Working carefully down this descent for 50ft. or so, you are on the level floor of a corridor about 30ft. wide and 60ft. high. Very soon this corridor forks into two arms at right angles to it. The one to the left is not much larger than the entrance corridor, and offers nothing in particular to see. The right arm shortly begins to narrow, but for a considerable distance slopes gradually downward with a width of 15ft. and a height of 8 or 10ft. Here the torches show very distinctly the origin of the cave. On all sides it is vitrified and hung with solid drops of rock—proof that it was nothing but a great bubble of gas or metal vapor in a river of lava, which exerted sufficient outward pressure to hold apart the viscid mass until it finally cooled forever into rock. Afterward some convulsion of the mountain, which must have been abundant enough while the Upolu volcanoes were yet active, pricked one end of the bubble and established the communication with the outer air. A little further along is another evidence of this disrupting shock. A large portion of the roof of the cave has fallen in, and for quite a distance it is necessary to crawl along a tortuous course in and out among the rushes. Up to this breakdown, which is about a quarter of a mile from the entrance, the cave is qute dry. It is filled with birds, a sort of swallow, found nowhere else, and rarely seen in the outer air, which it is said to visit only at night. They nest in the crannies of the rock, and when scared up by the probably painful glare of the torches fly blindly about in clumsy flocks.

On the other side of the breakdown the cave continues its tubular shape and the same light gradient to the seaward. Here it attains a set of dimensions which appear to be constant wherever it is possible to take measurements: height 18ft. from fairly flat floor to crown of the arch, spring of arch above upright sides 2ft., width on floor 15ft. The atmosphere is cool as compared with the temperature of the outer air, but the difference is only great enough to be pleasurable, and it is not considered chilly by the Samoans, who feel the cold keenly. A quarter of a mile beyond the breakdown you reach the beginning of a stretch of water. Before reaching the lake the walls and roof of the cave have been noticed to glisten with moisture, but no drops appear to fall, and there is no trickle of water along the slope of the floor. The source of the lake is therefore unknown. The water is of the same temperature as the cave air. There are no water marks showing alterations of level, and Mr. Evans, who visited the cave hundreds of times in a long course of years, says that the water always begins at just the same place, as shown by marks he has established. There is no current noticeable in the lake, and floating articles do not change position between one visit to the spot and the next. The water has a reddish hue, and a startling effect is produced when one dives while another holds a torch above the surface; it seems like a bath in rich red wine. The water has to the taste no evidence of any marked mineral constituent. It produces a most emollient effect upon the skin, which for several days after a bath in the cave seems as soft and fine as that of an infant. It is also very soothing, and in time healing to the shallow ulcers which result from all skin abrasions in the South Sea Islands.

One can wade out in the lake for some 200yds. before reaching a depth of 5ft., beyond which it is necessary to swim. Mr. Evans has smoked the mark of his furthest limit, about 600yds. from the beginning of the water. Here there is but 15in. between the surface of the water and the crown of the arch. The writer with two Samoans passed Mr. Evans' furthest limit, and found that shortly beyond the roof of the cave begins to rise. About 100yds. beyond his mark there is only a single foot of air space, but 200yds. further on the roof is 2ft. above the water. Here also is a shelf of rock, on which it is possible to rest in the long swim in which one is handicapped by the need of giving up one hand to carry the torch. At this shelf the cave makes a blunt angle and extends off to the left. The party swam some 500yds. up this extension and found 3 or 4ft. of clear air overhead, but it was not possible to touch bottom by diving.

This seems to indicate that the cave gradually rises and that the water has drained into its lowest level, which it has nearly filled. No other opening is known to exist, but as the air is always fresh and sweet it is probable that there is a vent somewhere. Still it is probably no more than a crack, for the smoke of the torches nowhere shows any current in the air except the slow indraft at the known mouth of the cave. The fact that the water remains at a constant level shows that whatever inflow there is, and that has not yet been discovered, is balanced by evaporation and outflow. The water is such as easily to be identified by its color and softness, but none of the springs show the slightest trace of drawing on the cave for their supply.

The cave has been explored for very nearly a mile and a half, of which the mile is in the lake. It offers no difficulties except the tiresome scramble at the breakdown of the roof. With a bamboo raft, so built as to be able to pass under the low portion of the roof, it is quite likely that one could cross the lake to the dry cave beyond and complete the exploration of this the largest cavern known in Samoa.

Willam Churchill.

Yukon Notes.—X.

At the Canadian Custom House.

At Tagish Post of the Canadian Police, on the river connecting Tagish and Marsh lakes, Inspector Strickland and Mr. Godson, the Collector of Customs, were warning miners not to attempt the descent of the Yukon. Inspector Strickland had spent several years on the Yukon, and his advice was not to be lightly put aside. He said that he was confident the river was already closed by ice at Dawson, and that it was only a matter of days till it should back up to Lake Lebarge.

When we reached the post the Inspector and Mr. Godson were off hunting lynxes, which were abundant near by. They came in just as we were in the midst of a knotty discussion with Godson's second in command over a question of duty. This was then the Canadian Custom House for the Provisional District of the Yukon, and here duty was collected on all imports. Our goods had, however, been mostly purchased in Canada, and passed through Alaska in bond. We had papers for our provisions, but the papers relating to hardware had been left with Herrington after the division, and we had not thought it necessary to procure papers for clothing and personal outfit.

After hearing our statement, the assistant collector said he was sorry, but that the articles not included in our papers would have to be appraised and paid for at a rate of duty exceeding 25 per cent. A man from Seattle standing near by said he had been informed from Canadian sources that personal outfit would be exempt from duty, but that he had just had to pay on the rubber boots he wore. He said there wasn't any use kicking, that the Canadians had us by the short hairs and that they would levy on our false teeth and wooden legs if they could spot them.

We had experienced such fair and gentlemanly dealings with the Canadians in Victoria, however, that we had a different opinion of them. Our intercourse with the police officials on the S.S. Islander before reaching Skagway had proved that they were broad-minded and capable men, of a very different stamp from our own representatives in Alaska, who had assessed us $30 duty on $20 horses, and who, the common report ran, were amenable only to an argument that honest men will not give.

Accordingly, when Mr. Godson appeared on the scene we were by no means discouraged. I told him that all our hardware and all my partner's personal outfit and a part of my own were purchased in Victoria; that we had had papers covering our hardware, and had been informed by the people from whom we purchased various articles of clothing that no papers were necessary for personal outfit. This was the commonly accepted interpretation of the customs regulations on the Pacific coast.

The object of these customs regulations was largely to turn trade to the shop-keepers of Vancouver and Victoria, and other Canadian cities. In a general way we had complied with this, and given our trade to Canadian merchants. Our provision papers, which were properly attested, should prove the honesty of our statements and exempt us from the hardship of paying on goods that would have passed unquestioned had it not been for an error in regard to papers.

Mr. Godson asked: "Where did you get that coat you have on?"

"Across the street from the Oriental Hotel in Victoria," I replied. "The firm name was Pirie something or other."

"Where was your hardware purchased?"

Mac had bought most of this, and told without hesitation the correct address.

Godson said: "That will do. It was a close shave for you. A few days ago I had to make some men pay full duty on an outfit they said had been bought in Canada, but they'd lost their papers, so they said."

We thanked Mr. Godson, and learning who we were he handed me a note from Tappan Adney, of Harper's Weekly, who had passed about a week before. Adney left word that he had decided to push through to Dawson, or as far as he could get before the river closed, instead of stopping at the Hootalinqua River, as he had at one time thought of doing. He wanted us to join him, and told us to be on the lookout for a boat with a green and white barred sail.

Inspector Strickland remarked oracularly that Adney would never reach Dawson. "My advice to you," he said, "is to stop at the foot of Marsh Lake, where there is a good trail across to the Hootalinqua by way of the McClintook River. If by any chance you get as far as the juncture of the Hootalinqua and Lewis, don't attempt to go further. Dr. Dawson thinks the Hootalinqua the most promising prospect in the country. There is good timber and game, whereas if you attempt

to go further you are out of the gold belt and in a poor country to winter."

We listened attentively, but the advice in no way affected our plans. We had set for ourselves a goal, and were not to be turned aside while there was one chance in a thousand of reaching it.

Three months later we met men on the Hootalinqua and Marsh Lake who had heeded this advice, and they were all sorry for it. They implied personal motives to the officials for influencing them to stay in their particular district, and were very bitter in denunciation. Many of them had stopped at a time when it would have been perfectly possible for them to reach Dawson and get work at $15 a day for the winter, if they did not personally become claim owners.

Mr. Cæsar, of New York, who with Dr. Sugden, recently from China, runs a first-class woods hotel at Marsh Lake, belongs to this category. Cæsar describes how they were held up at Tagish by waving his arm with a peremptory signal to stop, and calling out in the voice of a Coney Island barker reciting the attractions of the show for which he is engaged to draw spectators: "Stop! Why go further? Fish, game and gold on the Hootalinqua!" etc., etc.

The Canyon and White Horse Rapids.

From Bennett at the start there is seventy miles of lake and slack water navigation, across lakes Bennett, Nares, Tagish and Marsh. Then comes an interval of fifty miles of swift water before reaching Lake Lebarge. Midway in this interval of river is the most serious obstruction to navigation between Bennett and the mouth of the Yukon. Here, where the river breaks through a basalt dyke three miles in width, are Miles Cañon and White Horse Rapids. The cañon proper is five-eighths of a mile long, and White Horse Rapids three-eighths, but the entire three miles is a continuous rapid, and the intervening distance between the cañon and White Horse is bad enough. We reached the cañon in the afternoon along with a crusty Welshman named Kent, who persisted in telling us a grievance he cherished against Hadney, as he called our friend, the Weekly man.

Just above the cañon, on a rocky bar in midchannel, a 30ft. Yukon boat lay on her side, wave-washed and empty. It looked as though the boat had struck the obstruction while going sideways, and been turned over and over, and crew and cargo swept out and carried down to the tunnel-like opening of the cañon below. No one knew anything of its history, and there is little doubt but that its crew perished.

Red danger signals and rude notices on the east bank warned us to land, and as we were a little nervous we went ashore too soon, landing in company with three other boats one eddy above the usual point of disembarkation. Later we dropped down to the regular landing in a cove where there is a strong back current, against which it is very difficult to row.

We were just in time to see Hepburn take a boat through. The greater part of the cargo had been taken out and a canvas wave-shield tacked on bow and stern. Two men rowed, and the pilot stood erect in the stern wielding his long oar, which was lashed securely to the thole-pin socket.

The curling green rollers from the sides form a V with the apex down stream. Where they meet in trembling, boiling, white masses at the center, the surface of the water is from 4 to 6ft. higher than at the sides. Boats go through with the speed of a railroad train. It is best to follow the crest of the current in the center of the cañon, and it is stated that boats that once get off this track are hurled to destruction on the adamant walls. Boats have not infrequently dashed against the sides never to appear again, except as splintered fragments cast on the shores miles below, but their annihilation was due to the steersman's loss of nerve or accident or other cause, and not to the popularly believed miscalculation in keeping to the exact center of the channel. This I know, because I have been close to the walls of the cañon, and found, as one would naturally suppose, that the tendency of the current is off shore and to the center of the river, where the friction is least.

Hepburn's boat went through like a bolt from a cross bow, traversing the mile from landing to landing in less than three minutes. It met with a momentary check to its impetuous course half way through the cañon at the place called "The Eye." Here a whirlpool has hollowed out a circular basin several hundred feet across full of conflicting currents. Below this the cañon resumes its normal width of 100ft., and 100ft. is the average height of its walls.

Shooting the Canyon.

Mac and I began packing our supplies across the portage the morning after reaching the cañon. We carried two 50lb. sacks of flour or its equivalent to a load, and took two-minute rests three times on the way at places where trees had fallen and lay the right distance above the ground to steady our packs upon.

Our first intention was to pack the entire outfit across, boats and everything, but an investigation of the rapids below the cañon made about noon resulted in a change in our programme. These rapids appeared to be almost as bad as the cañon, and there was no way of escaping them, as the portage around White Horse is on the best or opposite side of the river from the cañon portage. We were in for it anyway, and the cañon would not go bad as a flyer.

If we could have escaped all the rapids, I should have been content to give up the time necessary for carrying around, but as that was an impossibility I was glad that the necessity had been forced upon us of taking the risk. We should save much valuable time, and I had the utmost confidence in our little boats.

Mac at first would not hear of my going through alone. I only got the best of the argument when I gave it a materialistic turn and told him that the goods would be safer in my hands, and that if he lost a boat load going through the cañon it might prevent our wintering in Dawson, as he well knew we could not afford to lose a pound of food.

I made one trip that afternoon, and the little 12ft. boat went through like a bird. I was drenched to the skin by the spray, and shipped a few buckets of water, but that was all. I carried 400lbs. of cargo, which not only expedited our packing, but also was necessary to ballast the boat and keep her from tossing me out.

My second trip of the following day, or third in all, was an eventful one. Some acquaintances on the Skagway trail happened along just as I was about to start. There was Leonard, who told me on the portage between Middle and Summit lakes how he helped to exterminate the buffalo, and Montgomery, with whom I spent a wild night in the tent of a third party, unknown to either of us, and two or three others with whom we were on speaking terms.

These men wanted to see a boat shoot the rapids, and they ran around to a point near the Eye where they could have a good view. I was uneasy about the trip, and had a premonition that something would go wrong. The idea of spectators annoyed me, and incidentally while talking with them I had neglected the precaution taken in former trips of making fast both oarlocks close up to the sockets. The chains to which they were attached gave 3 or 4in. play and waves were likely to unship them. Fortunately, however, one oarlock was already so fastened.

The particular boat whose turn it was to make the trip was, as we afterward became convinced, our hoodoo. She had been more roughly used than the others, and had in measure lost her graceful curves, having less rise fore and aft than they. She was covered almost completely over with canvas, which was raised on pole tripods placed a few feet from the ends, so as to shed water, and only a narrow slit in the center was open. I knelt in the bottom of the boat with a sack of flour at each thigh for a brace, and propelled the boat by pushing, which enabled me to face the rapids and see just where I was going.

From the great pool above one can see no entrance to the cañon. The current sweeps down oilily toward a wall of rock which appears to dam the river. The roar of many waters is in the air, however, and one notices that the wild ducks carried within 50yds. of the obstructing mass take wing and fly back up the river.

Of a sudden the damp, misty gap opens, and in place of the smooth surface a long vista of leaping, ghost-white masses of foam. These have the peculiarity of appearing and disappearing always in the same place. They do not advance like ocean waves, but at one particular and unchangeable spot execute fantastic movements, witch-like, uncanny, genuflexuous wavings of phantom arms, turning and becoming forever repeated in the same unvarying way.

Just before reaching the Eye a wave struck my left oar and threw the oarlock out of the socket. By alternately pulling and pushing with the remaining oar, I kept the boat head on till the roughest water was passed, and the boat shot out in the somewhat smoother surface of the whirlpool.

I had to get that oarlock back again before I could cross the seething cauldron and take the second drop of the cañon, so I turned my eyes from the water ahead for a moment, reached out and replaced the oarlock. The same instant one of the minor swirls of the whirlpool caught the boat and whisked her about like a feather in the wind, and the green water came in 6in. deep over the right gunwale. Instinctively I threw my weight to the opposite side of the boat and succeeded in raising the submerged side before the boat quite filled. Simultaneously the oarlock which caused the trouble broke its fastening and slid off the end of the oar to the bottom of the cañon.

I took a breathing spell to consider my position. The boat was full of water washing from side to side, so that it was like riding a bicycle to steady her. She was being sucked down toward the second part of the cañon, where in her present condition she could not survive a single wave. I was wet and cold, but I drew some consolation from the fact that I had on moccasins and should not be greatly handicapped if it came to swimming. The worst feature of it all was the spectators on the ledge above. Of course, the situation was realized in an instant of time. Under such circumstances one has to think quickly. I saw that I had to get to shore some way to repair damages, and the oarlock socket, which projected ¼in. above the gunwale, offered a fulcrum for rowing.

I put my loose oar against that and using both pushed for all I was worth. The boat advanced a trifle, wabbling from side to side, and threatening to give up and go under any instant. Inch by inch I drew away from the suction of the rapid, and eventually had her in the swing of the whirlpool, and the worst was over.

On the west bank a tree had fallen down from the forest above, and a portion of its branches projected into the water. I caught this and made fast the boat. Then I took my slicker hat and bailed her out, cut a piece of small rope 1ft. long and tied the loose oar to the socket, and pushed out into the current again.

I rowed, and with the headway acquired broke loose from the grip of the whirlpool, and entered the second part of the rapid, and in a fraction of time was safe at the landing below, where Mac was waiting my arrival in a very uncomfortable frame of mind, having heard a rumor that the boat had been swamped.

I took all four boats through Miles Cañon in turn, and we carried one back and got our tent and camp outfit, and made a fifth trip through to a point just above White Horse that same afternoon.

J. B. Burnham.

African Skins.

In Mashonaland and Central Africa the trade in skins still flourishes, though only the poorest of the Boers follow it, and they have to trek north of the Limpopo. The hides of the larger bucks, such as the sable antelope, the roan antelope, the hartebeest, or of any of the zebras, are worth 8s. or 9s. each, and there is now something to be made by selling heads and horns as curiosities. Leather made from the skins of these big antelopes is still in common use in high-class bootmaking. No one knows exactly what animal may not have supplied the uppers or soles of his footgear, and the possibilities range from the porpoise and the arctic hair seal to the blesbok or the koodoo. Three other African animals' skins are in commercial demand for curiously different purposes.

The giraffes, as every one knows, are killed so that their skins may be made into sandals for natives and sjambok whips for colonists. In the Soudan they are also killed for the sake of their hides, which are made into shields. Many of the dervish shields captured during their attempt to invade Egypt under the Emir Njumi were made of this material. The elephant and rhinoceros skins go to Sheffield. There they are used to face the wheels used in polishing steel cutlery. No other material is equally satisfactory, and it would be most difficult to find a substitute.

The rhinoceros skin used was formerly that of the white rhinoceros. Now that this species is extinct, the black rhinoceros of Central Africa is killed for the purpose. Much of this immensely thick skin, which is not tanned, but used in the raw state, never leaves Africa. It is in great demand for making the round shields used by the Arabs and Abyssinians. A black rhinoceros's hide yields eight large squares, each of which will make a round shield 2ft. in diameter, and each of these squares, even in the Soudan, is worth $2. The skin when scraped and polished is semi-transparent, like hard gelatine, and takes a high polish. Giraffe skin is even more valued as material for shields, as it is equally hard and lighter. Thus, while the South African giraffes are killed off to supply whips, those of North Central Africa are hunted to provide the Mahdi's Arabs with shields.—London Spectator.

Natural History.

A Fighting Snake.

What "Uncle Sam's" loss is, in not having Fred Mather wearing the blue, we do not know. Our gain in having him writing for us in his charming and inimitable style, we do know. The chapter on snakes in his recent story about "Wild Fishers" reminded me of an incident that may be of passing interest.

It is no fearful and wonderful story of enormous serpents, or marvelous escape from almost certain death, but is just an account of one of the many incidents that the devotee of the rod and gun experiences, a little out of the usual run. It begins with a confession: I will do my share of any, or all, of the hardest work that falls to the camp without complaining, except under one condition, and that is where a snake interferes. I would not seine for minnows in water where I had just seen a snake disappear if the entire camp was facing starvation, and every minnow caught was sure of a 10-pounder. And I would eat raw bacon until ashamed to look a hog in the face rather than gather firewood from the wood pile where even reliable information had located a snake. I have faced many a peril by field and flood, but never have shown, and I fear never will show, a decent front to a snake. I am duly ashamed of this weakness, and have honestly tried to overcome it, but cannot even claim to be convalescent.

The water moccasin that Mr. Mather writes about is particularly abundant in the lakes and bayous of the Southern States. In the southern part of Mississippi, along the Pearl River, where lakes and bayous afford excellent fishing for white perch, bass (called trout by the natives), goggle-eye and bream, I have found them plentiful and annoying. Like all poisonous snakes, they are sluggish, but to a less degree than land snakes of equal venom. Their habit of lying on the limbs of low trees and bushes overhanging the water is more than unpleasant to the snake-timid fisherman. You generally fish in toward the bank from a boat, and paddling quietly along seeking out good sheltered spots for a cast, you are often startled by a "plunk" in the water—like the dropping of a plummet—followed by the oscillation of an overhanging limb, and you know that a moccasin has made it unnecessary for you to cast in that spot. Sometimes the gentleman will drop into your boat, in which event—so I am informed—he will take himself off as quickly as possible, if you but sit still. The reason I cannot verify this is the fact that I never did sit still under such conditions; never even tried to. I have never yet seen the boat that was large enough for me and any brand of snake to use jointly, so I have invariably vacated, sans ceremony, when a mocassin saw fit to board my craft.

A fishing companion, who had treated this weakness of mine with scant consideration and much levity, one time reached up and caught a limb just overhead to steady the boat, while we were quietly slipping along the shady side of a Mississippi bayou fishing for bream; and an instant later discovered that he had grasped, with the limb, a well developed, active specimen of the snake family, genus moccasin. This excellent opportunity to give me an object lesson on self-control he wasted. No amount of fear of snakes in general could have caused him to act more promptly or vigorously. His frightened shriek split the atmosphere like the scream of a panther, and was the first intimation I had of there being anything wrong with him. When he finally quit threshing around like a crazy contortionist, and explained his surprising conduct, he did not lack for sympathy. It was a dangerous and nerve-trying experience, and a narrow escape, as a moccasin seldom accepts an apology for a liberty taken with him, but strikes at once when touched.

That they are provided with fangs and poison I have proved by a careful examination. After pressing the mouth well open with a stick, I have seen the fangs stand out like the claws of a cat, and by a little pressure eject the green virus through the small opening in the point. That they invariably retreat when attacked, if retreat be possible, has been my observation, with one exception, which is the adventure I would narrate.

Fishing one day in a bayou of the Pearl River, with one companion, we sat in opposite ends of a long, light boat, which tapered equally at both ends, but did not come to a sharp point. It had but three seats—one at each end and a middle seat. When a change of position was desired, we sunk a light paddle in the water and

quietly propelled the boat by strokes under the water so as to make no splashing.

My end of the boat had turned toward the nearest bank, which was distant about 30ft., and lying asleep on a log at the water's edge I noticed a moccasin of very fair proportions.

Signing to my companion, I pointed to the snake, that he might hold the boat steady while I tried a shot at it with a small pocket pistol—a 22 cal.—that we always carried on our trips, and in the use of which constant practice had made me very expert. The snake's head was not visible, so I concluded to try a shot at the thickest part of the body, which showed clear on the highest part of the log, presenting a fair mark that I could hit nine times in ten shots, hoping to break his spine. My pistol was a single shot, which was usually no disadvantage in shooting at snakes, as they always took to the water if not disabled at the first shot. Taking a very careful aim at the fair mark presented by the snake's body on the log, I fired.

The boat must have moved slightly just at that moment, for my shot struck ½in. lower than intended. Instead of going through the snake's body, it went between it and the log, and must have felt very much like a hot iron, judging by his actions.

After a quick shiver and full length squirm, he began to bow his back and spit like an angry cat.

This was so very unusual that it amused us very much, and we sat laughing heartily for a moment or two, expecting every instant that the snake would take to the water and disappear.

Suddenly the snake swung round with its head stretched out in our direction, and plunged into the water, but did not disappear. Threshing through the water like mad, he made straight for me with an air of business that cured my attack of laughter promptly and effectually.

I was paralyzed with fright, but could not believe that the snake was really coming to attack us, and sat looking at his approach, expecting every moment that he would dive or turn aside.

But he did neither. Straight on he came until he was but a few feet from me as I sat in the boat, and then I recovered my powers of locomotion and most ingloriously fled. There was no choice of routes, so straight down the long, slender boat I dashed toward the end my companion occupied, clearing the middle seat with a jump that nearly drove the bottom out. My companion had started up with a startled cry to "Look out!" and had grasped a heavy paddle lying in the bottom of the boat, but seeing me bearing down on him in a wild flight, that was certain to carry us both over the end of the boat into 20ft. of water, he dropped the paddle, stooped low, and caught me with an approved football tackle hold just above the knees, and together we fell with a crash against the end seat, my head striking with such force that I was dazed and rendered almost unconscious. Springing to his feet, my friend snatched up the paddle and ran to the end of the boat that I had fled from, and found the snake still in pursuit, although the boat had moved some distance from the impetus given by the sudden arresting of my flight. Not until he had received a blow that almost disabled him did that pugnacious serpent retire from the attack. He then swam back to the bank and crawled out by the very log where first we had found him.

When I had sufficiently recovered from the knock on the head, and gathered my scattered wits, we held a council of war, and there was a division in the camp.

The man who was not snake-timid was in favor of going right in and whipping out the enemy with our heavy paddles; while the man who was most decidedly snake-timid was in favor of a general and immediate retreat from the unpleasant and, to him, unfortunate location. We finally compromised by landing the boat at a point some distance from the enemy, and the able-bodied contingent went to the attack alone, while the sick and wounded stood guard at the boat. The snake refused to retreat to the water, and was killed with a long pole while still showing fight. This is no exaggeration of the attack of the only moccasin that I ever saw "carry the war into Africa."

LEWIS HOPKINS.

Albino Swallow.

LAKESIDE PARK, N. Y., Aug. 13.—*Editor Forest and Stream:* A few days since, while crossing the bridge at this place, I saw a white bird flying over the water. I had only an instant's view of it, and my first thought was that it was a dove, only that it seemed too small. I dismounted from my wheel and returned to the center of the bridge, thinking to get another view of it. I had not long to wait, when to my surprise a perfectly white eaves swallow came flying over the bridge, within 30ft. of me. When I reported the observation at the hotel a lady said that she had seen a white bird flying with the swallows, and wondered what it could be. Since then, I presume, it has been reported to me by more than a dozen people. One party said he saw one seven miles up the lake; another party saw it two miles down the lake shore.

It is possible, but hardly probable, that there is more than one albino swallow here; and undoubtedly the bird I first saw is the same that has been reported to me so often.

I was wheeling in the country about a mile and a half from here this forenoon, when I saw a number of swallows flying over a clover field. Among them was the albino, and to my great surprise and pleasure it flew over my head twice within one minute, and as it was the only swallow that passed over the road I thought it wanted to show to me its exceeding beauty of pure white, or was it the harbinger of the "white wings of peace" that within the next hour I saw proclaimed in the morning papers?

J. L. DAVISON.

MALDEN, Mass., July 27.—*Editor Forest and Stream:* My friends who are lovers of the rod and gun and nature's works, but cannot be in the field, don't know what they miss if they do not read your paper. It is a wonderful solace when we are blue and thinking of friends on their vacations, while we are chained at home.

C. E. B.

Some Animal Pets.—IV.

SAN FRANCISCO, Aug. 5.—It is a misnomer to call this a chapter on animal pets, inasmuch as I purpose drifting off on to birds, and perhaps should call it pets in general.

In my boyhood days, in the rear of the old country home, an immense elm tree had grown until its upper branches reached the attic window, the attic being relegated to the use of us boys as a playroom. One branch of the tree brushed the window sill within easy reach of the hand, and on this a pair of robin redbreasts built a nest, showing their confidence in us. This was not misplaced, for we took care not to disturb them; and although we sat at the open window within 2ft. of the nest, and after the complement of eggs was laid, the mother bird proceeded to perform her natural duties by setting on the nest, and seemed to take pleasure in watching us. We brought bread crumbs and laid them on the window, and retiring, watched to see if she would notice them. At first she did not, but later in the day, perhaps because the male bird was amiss in his duties in bringing her food, or shirking his turn in setting, and she became hungry, she came to the window during our absence, for when we returned later the crumbs were gone.

We continued to supply bread crumbs with an occasional worm, all of which disappeared. One day, on account of absence, we omitted the supply until late in the day; and when, toward evening, we carried up the usual rations, much to our surprise she hopped off the nest, and regardless of our presence lit on the open window sill, and ate the crumbs with avidity. Ever after whenever we brought food she would hop down and partake, and in a few days would eat out of our hands without the least timidity, and finally would keep her seat on the nest and allow us to feed her from our hands.

When the little chicks made their appearance, she would allow us to handle them, and seemed pleased at our notice of them.

The male bird would sit on the limb and eye the proceedings, apparently not quite approvingly at first; but seeing that no harm came from such familiarity, became reconciled, and by way of expressing his gratitude for the attention would carol his sweetest songs for our benefit. He evidently appreciated our relieving him from the onerous duty of providing for the wants of a numerous family.

When the young birds were able to leave the nest, their first essay was a short flight to the window sill, and thence into the attic, hopping over the floor. We fixed a box for them, into which the old bird gathered them at night, until in a week she probably said to herself, "This is too much luxury; and it is time you youngsters were taught to take care of yourselves and learn your duties." So one day they all disappeared, but we saw them down in the orchard. Almost every morning the male bird would give us his serenade. Later in the season they all disappeared, and we saw them no longer; but the next spring the old birds appeared and took possession of their nest, and proceeded to raise a family, and were fed as usual, and this continued for two succeeding years.

The third year they failed to put in an appearance, until one day the male bird was on the branch as I opened the window, and seemed dejected and low spirited. He hopped onto the edge of the nest and surveyed it sorrowfully. He had evidently come to tell us that he had lost his mate and was a widower. If he ever took another, he probably was unable to pursuade her to assume her duties at the old homestead, she arguing perhaps that the associations were too fresh in his mind and might lead to comparisons, on the principle that the second wife so universally banishes the portrait of number one to the attic, when she, as number two, takes her place. But it is seldom that we know of an instance on the part of number two to object to taking possession of the family nest, especially if a fine establishment. Her fine sense of the conditions do not run to a point in such conflict to her interests.

What the subsequent fate of our pet robin and his later matrimonial ventures were we never knew, as we saw him no more. No doubt he had to work harder to supply his families than he did when the happy family in the old elm branch were under the care of us boys, and he had little to do but sing us a song occasionally. There are a good many similar cases in our experience where a man don't do even as much as that toward fulfilling his obligations to those dependent upon him, leaving these oppressive cares to the public or friends.

Referring to the susceptibility of birds to tameness under careful and kind treatment, we have so many instances, as in the case of Mrs. Minnie Moore-Willson, who writes of her pet cranes, that it is not impossible to believe that almost any species could be domesticated. Although, come to think of it, I will except one. On one occasion, when I was about sailing from Poryta, Peru, a native to whom I had shown some favors brought aboard a young condor. It was the personification of viciousness, apparently, and proved to justify this opinion. As sailors are especially fond of anything in the pet line, I turned him over to the forecastle. He was an enormous bird, and on the voyage grew to full size. But, oh, what a vicious, spiteful, ungrateful specimen he proved to be. He would bite the hand that fed him, and at times would take possession of the forward deck. We made a small chain fast to his leg and confined him under the anchor deck. Occasionally a sailor would come within reach of his bill and talons and would suffer. Except for the fact of his being a rare specimen of the great South American condor of the Andes, I would have thrown him overboard; but concluded to endure him until arriving in San Francisco, when I donated him to the menagerie out at Woodward's Garden, and was glad to get rid of him. He was a specimen of the most unmitigated viciousness that I deemed possible in the way of a bird. He nearly created a famine aboard the ship, for he was as voracious as a shark. A pound or two of salt junk was nothing. I think he could have eaten the whole of the horse that generally constitutes Jack's rations. As for domestic pets, I withhold my approval of South American condors.

It has been asserted that quail could not be tamed, especially California quail; and I was inclined to that belief until seeing evidence to the contrary.

I had made efforts myself to do so by securing one brood but a few days old, which it was necessary to feed forcibly. But no amount of handling seemed to have any effect. They would flutter and dash against the cage whenever they were approached. I tried them separately, but it was useless, and I finally gave them their liberty. Going into a saloon one day, I was greatly surprised at seeing a California cock quail strutting up and down the bar counter, with that air of pompous pride peculiar to the California species. The fellow was perfectly tame, and would light on the barkeeper's shoulder when called; but the strangest thing was that he would drink beer, of which he appeared very fond; and when I held out my glass toward him he immediately ran toward it, and dipped his bill into it several times with seeming gusto, but evidently knew when he had enough. Association with mankind had brought about the usual results in demoralization so far as to teach him bad habits, but not to the extent of going beyond the limit of prudence and good sense. Therein the bird rose superior to the man.

I made extravagant offers for the little fellow, but no amount would induce the saloon man to part with him, as he was a great attraction and brought custom, especially of every sportsman in town. "That reminds me" of a similar case of the first cargo of Japanese goods and curios that came here from Japan. Among them was a very ingeniously constructed mermaid, composed of the head and shoulders of a young monkey, the rest of the body a very skilfully grafted fish. It was impossible to discover where the monkey left off and the fish began, and the specimen was an enigma to several scientific professors who examined it. On the sale of the cargo at auction, bidding for the mermaid was very spirited. It was finally knocked down to one Jones, a saloon man, at $150, who hung it up in his saloon, of which he changed the name to "The Mermaid." The original cost of the curio was 35 cents. It was thought to be a good joke on Jones, but he declared he never made a more profitable investment in his life. The price the mermaid brought stimulated trade in that line, and large orders were sent to Japan for mermaids, overstocking the market, until they were a drug and were of dull sale at 25 cents, allowing all the doubting professors to discover by dissection how they were constructed, and a consequent reversal of their former judgment that the original one was a simon pure genuine article. Professors do sometimes slip up.

PODGERS.

In the Woods.

THE mere hunter or fisherman loses the best part of his life if he is not something of a naturalist. That is, one who studies the life of the forest, as well as hunts and fishes. There is nothing more beautiful in the world than nature in its wild moods. And one who has an eye and mind for these beauties need not care if the fish are not so easily seduced by the fisherman's wiles, or the birds are wild and the bag is light. I have thought of this years ago, but never felt it so much as during the past summer in this delighful and picturesque part of the Southern woods. Here it is mostly all woods, not nearly one-tenth of the land having been cleared for cultivation. Most of it, however, is held for the value of the fine timber, which exists in abundance, and along with the facilities for rearing game thus afforded, the most agreeable climate, the entire absence of tormenting flies, which make the Northern woods almost unbearable, and the silence broken only by those sounds which delight the soul of the naturalist and the sportsman, the perfectly pure water flowing from uncontaminated springs—hundreds of them within gunshot of each other—gathering into brooks, making music as they sing, rippling over the clear rocky beds, or running down the innumerable cascades; these, and as well the gorgeous flora of the whole summer season, and uncountable curious phenomena of wild nature, all go to give a charm to the sportsman's mind able and eager to study and enjoy the scenery.

The forest is blazing at times with the brilliant azaleas, beginning in April and lasting until June. Then come the Kalmias, lining the mossy rocks of the gorges along the banks of the streams, small and great; then the rhododendrons, with their great clusters of bloom, scores, hundreds, and at times, on the largest bushes, thousands of them, actually filling the forests with glorious color; at the same time the sweet tuberose-scented azalea viscosa, or clammy azalea, with its pure white sweet-scented clusters of flowers, cover the ground with their lower growth; the beautiful little saxifrages cover the rocks, half hidden among the vari-colored mosses, and dripping with the moisture which everywhere exudes from these cliffs and goes to feed the myriad springs, making the clear brooks and rivers in which the trout live and breed, and wait the delusive fly which tempts them into the fisherman's basket. These, with the loud whirring of wings of the pheasant or partridge, the pleasing cry of the Bob White, and the quiet, enticing answer of his mate, and with endless variety of woodland phenomena, all go to make the man who loves fish and birds well, but nature more, entirely careless of how the world wags elsewhere, so that he

> "Finds tongues in trees, books in the running brooks,
> Sermons in stones, and good in everything."

I was interested in the matter of the honey dew mentioned recently in FOREST AND STREAM. There is philosophy in this; it is not a mere incident, but one of the curious works of nature. The explanations given by several correspondents recently, however, do not go to the root of this matter. It is the result of a common function of vegetable growth applicable to trees mostly. During the winter the sap of the tree has been accumulating mostly in what is known as the cambium layer of it. This is the new annual growth of wood lying between the bark and the last year's growth. The sap has been gradually growing sweeter, and as we know with the maples and the hickories, and even the white pine, this sap is very sweet. About the

season when the Northern farmer, who has his maple grove, is thinking of tapping his tree, the sap is gathering in this part of the tree. In spite of cold and snow and ice, the warmth of nature in all living things sets this sap in motion from the source of it to the cambium layer, lying between the old wood and the bark, the sap wood, as we call it, from the base of the tree (the roots) to the topmost twig. It gathers in this part of the tree, and as the growth of the tree increases at some seasons, we can scarcely distinguish why or how, but it appears mostly in a dry time, there is a surplus of this sap gathering in the leaves, and under the pressure due to that process known as osmosis the sap flows by the passage of it from wood cell to cell, quite irrespective of the force of gravitation. The sap passes through the walls of these cells by this force.

And as there is an excess of it for the growth of the tree it issues through the leaves and gathers on the surface, sometimes so freely that it drops from leaf to leaf, and finally even moistens the leaves of shrubs under the trees or the ground. It of course attracts myriads of insects—bees often—which feed on it, but mostly plant lice, which gorge themselves with it. Otherwise these lice would get it from the leaves by suction, as they pierce the leaf with their suckers. The excess of the sweet sap and the presence of these lice attract the ants, which, it is alleged, induce these lice to exude the sweet sap through their skins, and so get their share of it. The effusion of the honey dew is thus caused by the pressure of an excess of sap in the tree, and my belief is that this exudation is most profuse in a dry season, when the supply of moisture in the soil checks the growth of the tree, so that there is not sufficient use for the excess of sap.

This matter brings up another related to the work of these insect parasites of trees. This is the work of gall flies, minute insects which puncture the leaves or buds of plants or trees, depositing eggs in these punctures. The irritation due to their presence in the tissues causes an abnormal growth, some of these growths being quite curious. The witch hazel gall is a small conical growth on the leaf, and sharp pointed. One on the scarlet oak is round and smooth, and is prettily spotted, really a distorted bud, in which the fly has laid an egg. The azalea is very commonly infested with these gall insects, by which large irregular growths are made on the small stems where a leaf should have been. I need scarcely say that the oak galls are sometimes used in various industries for tanning or making ink, on account of the large quantity of tannin they contain, and which, with iron salt, makes an intensely black liquid.

But it would fill the FOREST AND STREAM full every week for months to mention a small portion of the interesting things to be found in the forest, and even in the streams, by one who has a habit, founded on a love for it, of prying into and studying the wonderful works of nature. If every sportsman were a naturalist, and noted these things, the mere love for sport would become a secondary thing, just as the pleasures of the mind and intellect are far surpassing those of the mere animal nature of mankind, which is merely akin to the hunting proclivity of the animals the sportsman competes with in pursuit of his game.

"One impulse from a vernal wood
May teach you more of man,
Of moral evil and of good,
Than all the sages can."

And thus the true sportsman, who would enjoy life in the woods to the full, must surely be at least something of a naturalist, and live very close to nature.

I was very sorry that your Mr. Hallock did not visit what he calls the lakes at this place. They are not exactly lakes like the Sapphire Lake, but good-sized ponds, in which he could have found the 4lb. trout which he didn't get at Sapphire. To be so near and yet so far greatly disappointed me. H. STEWART.

HIGHLANDS, N. C.

The Band-Tailed Pigeon.

WE have received from a correspondent from Stockton, Cal., the flat skin of a bandtail pigeon of the Pacific coast, sent to show the marked difference between the passenger pigeon of the East and his Western cousin. This difference is very striking—one of its most obvious features being seen by a comparison of the cuneate tail of the passenger pigeon and the nearly square one of the bandtail. The latter belonging to the genus *Columba*, while the genus *Ectopistes* was made to include the migratory bird of the East. The specimen sent us was killed on the McKenzie River, in Oregon, late last June, at which time the birds were feeding in the cherry orchards and berry patches. Our correspondent states, "One of the few killed discloses mature eggs, showing that they were nesting at that time, which was late in June." It will be remembered that observations made not very long ago in the southwest during the breeding season gave the observer reason to think that these birds carry about with them their single egg.

A Wisconsin Report.

A LETTER from the railroad agent at Manitowish, Wisconsin, says: "There is no pheasant hunting here whatever. But there is some good fishing and deer hunting. Guides say deer are more plentiful this year than they have ever known them to be before. I have myself seen, while taking walks less than a mile from my station, three deer at one time, and always see not less than one. There is also fair duck hunting on the Manitowish River."

The Forest and Stream Publishing Co. are the largest publishers and importers in America of Books on Outdoor Sports. Their illustrated descriptive catalogue will be sent free on request.

Game Bag and Gun.

The "Brief's" Pictures.

THE illustrations in the current edition of Game Laws in Brief, Mr. Charles Hallock says, well represent America's wilderness sports. The Brief gives all the laws of the United States and Canada for the practical guidance of anglers and shooters. As an authority, it has a long record of unassailed and unassailable accuracy. Forest and Stream Pub. Co. sends it postpaid for 25 cents, or your dealer will supply you.

Reminiscences of an Old Sportsman.—XVI.

THERE was one cover in Tolland where we always found grouse in abundance, and many famous bags we made here, even after the surrounding covers were desolate. This cover was not an inviting one to look at, and I probably would not have found it, but upon my second visit to the locality I made the acquaintance of a farmer, who told me of it and gave me a cordial invitation to shoot over it whenever I wished. The cover was in a little valley among the hills in the eastern part of the town, and was from five rods to forty or fifty in breadth, and wound among the hills for more than a mile. A little brooklet ran through the valley among the alders and maples which covered the ground, and there is scarcely a square yard in the whole cover where I have not found birds. When I first entered the cover it was well along in the afternoon, and it was my intention to make a hurried examination only, as I was several miles from my stopping place, which I wished to reach before dark, as I was unacquainted with the roads, but before I had been in the cover ten minutes I lost all consciousness of everything except grouse, and at twilight I found myself a mile from my team, with fifteen heavy birds in my pockets. But my heart was light, for I had found one more bonanza, the sure abiding place of my favorite bird. The farmer's house was only a few steps out of my way, so I called upon him and made him happy with deeds as well as words, for, after thanking him for the information he had given me, I laid upon the kitchen table a couple of brace of the birds and took my departure with lightened load, and still lighter heart. This was the beginning of a sincere friendship that lasted until the final parting came. Two or three times each season we enjoyed the hospitality of my good old friend, and upon each occasion he tramped with us through the cover and soon became an ardent lover of the sport. It was mainly through his persistent efforts to keep our favorite cover free from the footsteps of the vandals who had laid waste nearly all the surrounding covers that we so long enjoyed abundant sport in this our happy valley.

The shooting here was of marked peculiarity, for nearly every bird, as soon as flushed, would mount straight in the air like a rocket and make for the steep and almost inaccessible hillsides that completely surrounded the valley. But difficult as the shooting was, Eaton and I were on to them, and many famous bags did we make. Our best score here was twenty-eight November birds, and we were back to the house for lunch before 2 o'clock. There were birds in those days, and during the woodcock season our score for a three or four-day trip in this section of country was seldom less than 100 birds, and often it would be thirty or forty more than this, but notwithstanding the large quantity of game that we brought home and distributed among our friends I never heard one of them complain that there was an over supply, and I know that we did not impoverish the covers, for we shot over so large an extent of territory, and visited the different localities so seldom, that there was always an abundant breeding stock left, and, as the years passed by, each returning season found our favorite covers as bountifully supplied as when first we explored them.

The advent of the market shooter, however, changed all this, for with them a bird in the hand was worth more than whole broods in the bush, and they therefore usually made a clean sweep, and very nearly extinguished everything in the way of game in many of the most prolific covers in this section of country. In those days there were no posted grounds worth mention, and scarcely any attempt was made to enforce the crude and meager game laws.

The second season that we visited the Tolland grounds we made quite a long trip of it, and extended our researches over considerable new territory, finding many excellent bits of cover that were well stocked with birds. After working out our best covers we turned south and drove the whole length of the town of Coventry, sampling such covers as we thought looked promising, finding woodcock fairly abundant, and goodly numbers of grouse and quail, but nothing that came quite up to our ideal until we crossed the line into Andover, and saw spread before us the beautiful valley through which runs Hop River. Here was a game looking country that even our fastidious taste was well pleased to pronounce faultless. Spread before us with lavish profusion was a bewildering display of inviting looking covers, scattered along the gently sloping hillsides and in the little valleys, where, with eye of faith, we could plainly see an abundant stock of grouse and woodcock, while an occasional grain field bordered with low growing bushes was suggestive of quail.

The next morning we drove back to the place intending to look over considerable ground, sampling a cover here and there, for we had not much time, as it was Saturday and we were some thirty miles from home, and for nearly one-half the distance we were entirely unacquainted with the roads, but the sport that came to us in the first cover we entered completely drove all idea of hurried work out of our minds. The cover was of fairly open growth, upon a gentle slope that led down to a sweet-looking alder run, while the opposite slope was covered with rather a dense growth of sprouts. Some fifty rods down the run was a swampy tract of about twenty acres that was completely surrounded by a wide border of alders, the whole making a picture that we had very rarely seen equaled. We entered the cover at the upper corner, and worked along the edge toward the run, and had nearly reached it when the dog, as he was crossing in front of us not more than 25ft. away, suddenly dropped all in a heap with his head turned back over his shoulder. While we stood enjoying the very singular picture, Eaton raised his hand, and with a low breathed "sh!" pointed a little to the right of the dog, and as I turned my eyes in the direction I saw a bevy of nearly twenty quail slowly coming straight toward the dog. When the foremost ones were within 3ft. of him, one of them stretched out his neck with his head turned sideways, then with an alarmed "chit-chit," which was echoed by some of the others, all of them sank into the ground out of sight, and it was in vain that we strained our eyes and carefully searched the ground, not a trace of one of them could we discover.

Not the least interesting part of this performance to us was the behavior of the dog. The wind was in the wrong direction for him to smell them, but he was too old a campaigner not to know that they were close by, for he had heard that warning note too many times to be deceived. This dog was well trained and had lots of intelligence, but I had never given him instruction that covered this point, and he appeared to be all at sea. It was comical to see him roll his eyes toward me with a look that plainly showed that he was perplexed, then he very cautiously turned his head partly toward the place where he had heard the warning sounds, and we could plainly see his nostrils distend and collapse in an effort to smell them, but it was of no use, and he again turned his head in the direction of his first love, but thoughts of those quail in such close proximity evidently disturbed him, and he again turned his head toward them; but there was still no scent, and he again put his head over his shoulder for a second or two and then he compromised the matter by sticking his nose straight in the air and holding his point in this position until we went to him and flushed the birds. A woodcock rose first, only a few feet behind the dog, and a second later the quail flushed, and all, with the exception of the woodcock and three quail, went down the run. Just before the quail disappeared from sight another large bevy rose under them and went in the same direction.

Following them down the run a short distance, we found a brace of grouse that gave Eaton a nice double, which he attended to in his usual good form. One of the birds fell dead, but the other turned when struck and flew about 200yds. and fell on the opposite hillside among the sprouts, and I sent the dog after it, but as he did not return in proper time I went to see what was the matter, and found him on point. When I came to him and signaled a point to Eaton, a bevy of quail flushed wild beyond him, and they also took their course down the run. When I returned I found Eaton in a little open place upon a knoll that overlooked the swamp at the lower end of the run that I have previously described. As I joined him he pointed to the place, and told me that he had a presentiment that we should find down there about as red-hot a corner as we had ever struck. This I am pleased to say proved to be the case, for in addition to the three bevies of at least fifty quail that were hidden among the tussocks of grass and clumps of low growing bushes in the marshy ground in the center of the swamp, we found nearly half as many grouse and woodcock in the border of alders around the edge. This was indeed a red-hot corner, and had the birds lain as well as they often do, or had we been armed with breechloaders, the score would have been something phenomenal, for our shooting was of the best, but the trouble was that too many birds were in the air at once, and it was often the case that several would flush while we were loading. But notwithstanding the wildness of the game we were well pleased with the result, for when we returned to the team we counted out seventeen quail, eight woodcock and seven grouse.

It is the incidental happenings connected with our days afield that often bring to us the most pleasure, and add more to the day's enjoyment than pockets full of birds. Why! I would not barter the wealth of pleasurable thoughts that cheer my heart when, in overhauling memory's storehouse, some pleasing incident of the bygone days comes back to me for ten times the birds that have fallen to my gun. When recollection of this day comes back to me the air is filled with quail, woodcock and grouse in countless numbers flying in every direction. Little Gipsey is alternately pointing and bringing them in, while Eaton and I are shooting the score of our lives. Although I well know that there must have been some misses, the hand of time has erased them from the record, and the score is clean. The glorious October sun illuminates the brown and gold of the thicket above us with a radiance that artist brush can never portray. The balmy air encompasses me with a halo of happiness; worldly cares have fled, and with love in my heart for all the world I am a boy again. This is the day as it comes back to me now, and as I fondly trust it will come—together with many other glorious days—in the dim future, when the easy chair by the fireside shall hold me in its embrace, powerless to roam through my favorite covers in search of still other such days. There is a world of satisfaction in the thought that when our shooting years are over, memories of all that was pleasant and bright in the good old days will come back to bless and cheer us with happy thoughts of joys that once we knew. It seems to me a very singular as well as blessed thing, when these memories return to us after many days, that only the pleasant features present themselves; misses and all else that at the time was unpleasant have faded from memory's tablet, and only the brilliant shot and pleasing incident remain.

In a number of FOREST AND STREAM not long since Awahsoose hit me a rap for not missing more birds. Captain Bogardus was once pulling trap for me, and as I passed him, when going to the shooting point, he whispered the number of the easiest trap, and then almost before I called pull he let loose the very worst one, but a quick snap shot did the business, and the laugh was on him. When I asked him why he did thus, he answered that it did him good to see me miss. Now if this is what's the matter with Awahsoose, I don't mind telling him that upon a great many occasions I have missed more than half my birds, but for the reason

above given, I have too hazy recollection of those trivial happenings to attempt giving a record of them.

I well remember the day I ran a thorn under my kneepan that laid me up for three weeks, but I do not mark the day by this event, not a bit of it. The white stone that marks this day still stands on guard at the head of the little run, and when the moss-covered rock comes back to me I am at no loss to interpret the quaint hieroglyphics upon its surface, for they plainly tell me that while sitting here, unable to walk a step, six grouse, driven from below by my companion, all coming straight toward me, were piled in a heap without a miss. These birds, coming up the little run straight toward me at their best speed, I can still plainly see, and did not my note book inexorably say six, I could almost persuade myself that there were scores of them.

Our first day in the Andover covers was marked by no singular or striking incident, but the beautiful day, the pleasant surroundings, abundant sport, congenial companionship, and perhaps, best of all, light and happy hearts, caused it to be remembered as one of the most delightful of our many happy days together. We had devoted more time than we intended to the first cover, and to form an estimate of the value of our newly discovered territory we separated, and each took a turn through several different covers, finding birds and sign enough to satisfy us that our first impressions had not been far wrong, and we decided that in all our rambles, over a wide extent of country, we had found no sweeter spot than this. I shot over these grounds with many friends for more than twenty years, and always found plenty of birds.

SHADOW.

[TO BE CONTINUED.]

The Last Beaver of Beaver Island.

IT was on a Friday evening before the Christmas holidays. School had closed, and a two weeks' vacation had commenced. I was sitting in the library looking over my examination papers when the telephone commenced its b-r-r-r, b-r-r-r, b-r, b-r,. Before the receiver is at my ear I hear, as from afar, "Is Ak-sar there?" "Yes; this is he." Then there comes over the 'phone: "Let's go after cottontails to-morrow. We can skate up to the creek, cache our skates, go over the other side pontoon near that undergrowth, and get plenty. What say?" No more examination papers for me. Putting them away, I go up to my room and overhaul the little 12-gauge, fill my belt with shells, see that my hunting knife is sharp, and fill my tobacco pouch, which hangs Indian fashion from my belt. Hunting coat, buckskin breeches and leggings are laid out for wear on the morrow, and after taking a look out into the night I turn in.

Seven o'clock, and the mill whistles are blowing as I jump out of bed, and throwing up the curtain, gaze out on as perfect a winter morning as any hunter could wish for. The sun's rays are painting into gold the snow lying on the hills off to the west. A thin haze is discernable in the south, but overhead the sky is the deepest of blue. Breakfast and we are off. Taking the shortest cut for the river, we are soon at the boat house where our canoes are in winter quarters. Putting on skates and slinging guns by their carrying straps, we speed away over the clear, glassy surface for up the river. The sun's rays are turning into thousands upon thousands of diamonds the frost crystals on the trees and bushes along our course. Oh, how the blood rushes through the veins and the air makes ears tingle as we glide swiftly on with not a sound to disturb the stillness but the clink of our skates. But we are not the only ones on the river's frozen breast this morning, for away up near the foot of "Beaver Island" we see a tall figure plodding along. As we get nearer we see that it is Old Bill Hogey, fisherman, trapper and general all-round good fellow; one who would stop his work to give us boys any information about traps, how to bait for this fish and that, how and where to set our lines, and in fact anything in his way we youngsters wanted to know. He is always cheerful, and always ready to go on a fishing or hunting trip. Such is the man we skate up to. In one hand he is carrying his old single-barrel muzzle-loading shotgun, that has seen service as a musket, and in the other a new double spring Newhouse trap.

"Hello, Bill," we call out as we come up where he is waiting. "Hello, boys; going gunning this morning?" "Yes; after cottontails. Better come along, eh?" "Noap, see thet trap? Wall, thet's goin' ter catch ther last beaver up ter ther i'lan', if ther trap I've got thar now ain't got 'im; got two this week so fur and thar's only one left 's fur as I kin judge."

Although aching to stay and see Bill examine his traps, we knew him too well to tarry; for there was one thing he always kept to himself, and that was where he set his traps. We knew a colony of beavers had settled at the island, and although their cuttings were in evidence, we had never been able to catch sight of them. True, we had seen Bill skinning one large fellow in the shed back of his little store. Oh, how we had admired the thick, shiny fur, and wondered at the broad, black tail, that Bill had told us was "good eatin'." How, as a boy, I used to delight in seeing these interesting creatures captured. But now, how I should like to know that the beavers that old Bill used to catch in the lagoon were alive and still cutting timber on the banks of Beaver Island.

Leaving Bill behind, we strike swiftly up river for the pontoon. Reaching it, we cache our skates under a bunch of tumble weed, and clambering through the barbed wire fence start on our day's sport. We have not left the fence 50yds. when there is a rustling of dry grass and a scattering of snow and away speeds the first cottontail of the day. He has not run 30yds. before our guns crack. Thus it goes on. We skated down the river at nightfall with ten cottontails, three jacks and eight quail in our pockets—not a bad day's sport.

Nearing the bend where Bill has his little store, and seeing a dim light in the shed, we decide to investigate. As we near the door we hear Bill whistling softly—a habit of his when everything is running smoothly. We look at one another and both say as with one breath: "He's surely got him." Opening the door, for the latch string is always out to us, we behold a sight still fresh in memory. The room is dimly lighted by an old lamp suspended from a beam overhead. In the center of the room, lying on a board that lies across an old upturned barrel, is a beaver. Old Bill, with his sleeves rolled up to his elbows, glances up from his work and with his comical grin and wink, which mean volumes, proceeds to divest the beaver of his thick, glossy hide. We watch the proceeding with interest, till, with a last slash of the skinning knife, the hide drops to the floor. Then we ply Old Bill with questions regarding his capture. "Wall, boys, arter yer left me this mornin' I went ter whar I hed set this yer trap an' I see thar was sumthin' cotched sure, for the trap hed slid down ther pole inter deep water an' hed drowned what was at ther other end. When I pulled 'er up thar was thet thar beaver, an' I guess he's ther last one, too, an' yer Uncle Bill won't cotch any more beaver on this ere stream."

After watching the process of scraping and rubbing for a short time, we bid Bill good night and start for home.

Poor old Bill, he had troubles of which none knew; for one morning in early spring he was found dead in his little shed, shot through the head by his old navy, which he still clutched in his death-stiffened hand. Thus ended the life of one of nature's noblemen. He was generous to a fault, with a kind word and a helping hand for all. And we boys sincerely mourned his loss. May his rest be peaceful is the wish of his boy friend

AK-SAR-BEN.

CHICAGO AND THE WEST.

Good Chicken Year.

CHICAGO, Ill., Aug. 20.—I have earlier referred to the curious fact that of late years it has become customary to announce each season that the chicken prospect is "better than it has been for years." This same report was out last year, and this year it comes again from different sections of the West. I am disposed to give it credence this time for at least a portion of the Western chicken country. In upper Minnesota and North Dakota, near the Manitoba line, the breeding conditions have been very much more favorable this year than they were last, and there are unquestionably more birds than there were last season. I presume that in South Dakota the birds have at least held their own. We do not often hear of Wisconsin as a prairie chicken State, but really this bird offers a great deal of sport in Wisconsin every year. In Illinois we stood to have a good chicken crop this year in spite of a bad spring, but the illegal shooting has pretty well cleaned up the reasonable prospect of success after Sept. 15 in many parts of the State. On the whole, it seems that the prairie chicken has done more than was asked or expected of it during the past year. How the noble bird does hold on to the country which it loves! Give it half a show and it would always be with us, even under the changed conditions of to-day. Indeed, I believe that it is harder to kill a big bag of chickens nowadays than it was twenty years ago, supposing that the numbers of birds were the same. In the old days the birds used to go to the grass, and could be easily marked down. Now they fly perhaps a mile and light in the middle of a vast cornfield, where it is much harder to locate them or to shoot them. Chicken shooting in the open at any time before Sept. 1 is not very exciting, and does not compare with quail or snipe shooting as sport. The same birds shot when the blades of the corn stalks are edged with yellow is a mighty different sort of fowl. When he rocks and cackles and flies a mile, you can't kill him with a whip or with a squib of No. 9's.

Certain Sooners.

The farming country near Janesville, Wis., has always been a good one for prairie chickens, and this year the crop was a fine one, but the sooners have been out for weeks, so that the decent sportsmen fear they will have little left by Sept. 1.

The rich country lying back of the Fox River Valley of Illinois is another naturally fine chicken ground. Around Aurora this year there were birds enough to afford sport, but the supply is rapidly being slaughtered fully a month before the season by unscrupulous shooters. Last year the Aurora Game Protective Association was formed, with a membership of over 100, but this body seems not to have been able to stop the illegal shooting, and so far as I have heard has not secured any convictions.

Of all the famous chickens regions, that lying in Lee county, Ill., near the great Winnebago marsh, was perhaps the finest ever known in all the West. I have earlier called attention to the fact that the heaviest specimens of the pinnated grouse ever recorded were taken from this section in the earlier days. I have shot in that country within the last few years, and there were then still considerable numbers of chickens left. They have hung on and on, and this year they turned out in surprising numbers. At Dixon, Ill., in this great chicken region, there has been for years one of the worst sooner elements known in this State, where the great North American sooner may be seen at his highest stage of development. This year some of the leading sportsmen of Dixon tried to stop the depredations of these early thieves, and this week they sent a delegation to Chicago to ask Warden Loveday for help. A local paper has the following to say about the state of affairs in that section:

"At the majority of markets in Dixon, Sterling, Amboy, Morrison and other places prairie chickens are sold in open violation of the law. And what makes matters worse is that the farmers do not appear to care who shoots over their land.

"It was only by the most strenuous efforts on the part of Illinois sportsmen that laws were passed protecting the game of the State. Killing out of season threatened to exterminate what little game there was left. After the laws were passed we had to fight for their enforcement. It is simply due to the efforts of the law-abiding hunters that there are any quail, partridge, chickens, or wildfowl left in Illinois. Just because the enforcement of the game laws in past years has resulted in what might be termed an abundance of game this year, is no reason why it should not be protected."

Near Hanover and Leyden, Wis., a good many shooters have been out openly violating the chicken law, and last week a couple of parties came in with the "bottoms of their buggies covered with prairie chickens." No arrests are reported, although the shooters seem to care nothing for concealment.

Other Sorts of Sooners.

At Waukesha, Wis., on Aug. 17, George T. Anderson and Frank Harland, who were arrested by Deputy Myers for shooting illegal woodcock, were discharged by Justice Tullar, evidence not sufficient for conviction.

I must add to my galaxy of distinguished citizens who break the game laws the name of E. S. Brown, a justice of the peace at Star Lake, Wis. He was arrested by Warden Bissinger for night hunting deer on Plum Lake, and was fined $25 and costs. He knows more law now.

In Wisconsin there is this year an unusually large crop of local ducks, the teal and wood duck having bred exceptionally well. From different points come different reports that sooners are already shooting these ducks.

The Chandlerville, Ill., Times gives a very good notion of the protection situation in small country towns. It says:

"Already the illegal slaughter of young ducks has begun, and in the afternoons the booming of the guns of the duck hunters on the swamps is heard. There is no use talking, if the illegal shooting is not stopped, by the time the season opens there will not be a duck in the lakes and swamps. It has been suggested that we have a game warden appointed, but no steps have been taken to this end. The fact is a local game wardens finds it a difficult matter to prosecute those who reside neighbors to him, and consequently no one wants the job. What is our State game warden for?"

This is the same old cry, and it portrays the same old state of affairs. In these small communities each man is afraid of offending his neighbor, and no good man can be found who wants the job of deputy, for the deputy is far from popular. The good folk of Chandlerville call for the State warden to come and help them. This is all very well, but the State warden has many places to look after besides Chandlerville, and he could not himself go there and stay very long at a time. The thing for the Chandlerville men to do is to get together and resolve to be decent. Then they can get a decent man who will not be afraid or ashamed to go after the indecent shooters. The State game warden can no more protect the game of Chandlerville personally than President McKinley can run the post-office of Chicago. Providence helps those who help themselves.

Young Offenders.

George McPartland, Frank Applebee and Frank Leigh were among the boys who have been trapping and killing song birds in the vicinity of Chicago. They were arrested by Deputy Epsom and fined $5 and costs each this week. This is the way Epsom salts them. The boys and their mothers all shed tears, but it did no good.

State Hatchery Moved.

The Ohio State pheasantry will probably be moved from Van Wert to a point near London, in Madison county, the farm to be stocked with about 3,000 Mongolian pheasants.

Personal.

Mr. T. A. Divine, of Memphis, Tenn., was in Chicago for a day this week, and we had the usual pleasant visit together. Mr. Divine has been ill, and he tells me that Irby Bennett, his old-time side partner, is also ill. Capt. Bobo, the redoubtable bear hunter of whom we have heard so much in the FOREST AND STREAM, was very sick last year, and had to temporarily leave his Delta plantation and buy him a hill place east of Memphis in Tennessee. Mr. Divine brings the melancholy news that a railroad has this season been built slap through the Bobo bear country, crossing the great Sunflower canebrake country almost at the exact locality where Noel Money and I killed our bears with the Bobo pack in our last hunt. Bobo is disconsolate, of course, and indeed it is a sad thing, when we come to think of it, to see this fine game country ruined. I saw it when it was perhaps the wildest part of America, and the hardest to hunt in, and the best stocked, and one of the least settled areas of the entire country. Now, but a few years later, its riches are known, its timber is going, its brakes are burning for farms, and the railroads are cutting into its wildest corners. I asked Mr. Divine if there was left anywhere in the whole Delta of Mississippi any more of this old-time bear country, and said he no, it was all gone now. A few bears may be found once in a while in the Yazoo region, but that is about gone, and the Bobo strip, which was the best and last of it all, is now on the way to swift extinction. I wish that some of the wealthy men of the great cities would step forward as Bobo asked and buy up some of this rich land and make a preserve of it. Never was such a game country anywhere as this, and it was almost unknown for generations, from Boone and Crockett down, till the last few years. It was not altogether cheerful talking with Tom Divine over these rapid changes.

Mr. Ernest Seton Thompson, the naturalist, writer and artist, stopped at the FOREST AND STREAM office for a brief call to-day. Mr. Thompson is on his way west for a three months' trip. He goes into the Jackson's Hole country, and will cross the Teton Pass, coming out down the Gray Bull, the land of the grizzly king, Col. Pickett. We may naturally expect something interesting as the result of Mr. Thompson's observations among the animals of that region. He crosses into the Wind River country, one of the best big-game countries left in the Rockies.

Mr. M. M. de Lano, now of Chicago, once of the East, made the office of FOREST AND STREAM a little call this week, and we went into somewhat of his biography. Mr. de Lano has for some years been a resident of the West, living in Illinois and Wisconsin chiefly, but earlier in life he was a merchant at Wellsboro, Pa., where that unique genius, Nessmuk, made his home. One day Mr. de Lano was in his store when a little, dry-

looking man came in and began handling a whip that hung in the rack.

"Is this whip all whalebone stem?" asked the little man.

"I'm sure I don't know," replied Mr. de Lano. "It may not have more than a foot of whalebone in it, or it may run all the way through it."

"I'll tell you what I'll do," said the little man, "I'll give you a year's subscription to the Spirit of the Times (a periodical for which Nessmuk then was doing some work) if you'll give me the whip."

To this Mr. de Lano consented, and Nessmuk took the whip and split it open. The whalebone was found to run entirely through, a very nice strip, at which the little man expressed great satisfaction. "I wanted it to make a tip for a rod," he explained. From that time on he seemed to think that Mr. de Lano was an honest man, and he took him into his camps with him. Mr. de Lano is the "Bush D ——" described in the chapter on camping out in the volume "Woodcraft," and it was he who built the camp-fire that roasted Nessmuk out. He says Nessmuk was an odd customer. He was a shoemaker by trade, and sometimes he had orders to make a pair of wedding boots for some prospective bridegroom who needed them for the happy event. Suppose Nessmuk got one boot done and the other on the stocks, and at that time got caught with one of his fits for going into the woods; down would go the unfinished boot, and away he would go. The wedding might be postponed, or the bridegroom attend with but one boot. That was something for others to decide. Nessmuk went to the woods. That was the kind of shoemaker he was. E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Indian Modes of Hunting.

IV.—Musquash.

IN Canada and the United States, the killing of the little animal known under the several names of water rat, musquash and muskrat is so well understood by the average frontier boy that any information I can give would be perhaps a repetition.

Still there is one way that the Indian practices which is certainly not known to the whites, and is at a certain time very successful. That is spearing them on the ice; and another mode in which the Indians are very successful in the fall is digging them out, or "trenching" them, in the same way they do the beaver, only with much less labor, as it is done before the ponds and creeks freeze up. I will describe the latter way first, seeing it comes before that of spearing.

The resort of musquash (always where they are in numbers) is along grassy rivers, creeks, or ponds; for they store up large quantities of the long, flat grass for winter use, as the beaver does with young birch and poplar. The Indian paddling along the shores of such places has his eyes fixed on the bottom of the water; presently he perceives the entrance to one of the rat burrows; he stops his canoe and gazes fixedly on the opening, which is always about a foot under water. At last he sees the water ebb and flow in and out of the hole. This is a sure sign that the "wash" is occupied at that very moment by one or more rats.

He at once, either with his axe or the blade of his sharp maple paddle, chops down the mud bank until he has an embankment or dam. This is to prevent the musquash from running out to deep water. When all is ready, either his wife or the boy who is steering the canoe is sent ashore to prod about the honeycombed bank with the handle of his paddle. The little animals thus disturbed and thoroughly frightened make a rush for the outlet, deep water and safety, but (there is always a "but") the Indian, with his upraised paddle, has his eye steadily fixed on the water back of his dam, and as fast as one makes its appearance the sharp edge of the paddle is brought down on its head or back, and it is thrown into the canoe, quivering in its death agony. From two to eight or nine are not infrequently taken from one hole. When the last one is killed, the Indian moves his canoe on until he finds another colony, and the same process is gone over again, and he returns to his camp with his canoe filled with musquash. I have in the fall received from one Indian as many as 2,000 skins, large and small.

Musquash breed twice in the summer, and bring forth at each litter from six to eight. In the fall the large ones fetch the hunters ten cents, and the kits, or small ones, five cents.

The spearing of musquash is done in this wise: The rats throw up little mud-cone lodges, or houses, out from the shore, in about a foot of water. They are not unlike beaver lodges. The inside is hollow and the entrance is under water. In this resort the rats sit, huddled together, during most of the severe winter weather. The hunter, therefore, as soon as the ice will bear his weight, slides up to the rat houses, armed with a sharp, barbed, steel spear, about a foot long, let into the end of a small tamarac handle. This handle is generally about 8ft. long. Arriving close to the lodge, he poises the spear in mid-air for a moment and drives it down through the lodge with all his might. If he pierced a rat, he feels it wriggling on the spear, and keeps it fast there until he has torn away the mud and grass. He then seizes it by the tail and draws it with a jerk from the spear and knocks it on the ice, which finishes Mr. Rat. At times, when there are a number of musquash in the same lodge at the same time, the spear often passes through two, or even three, at one stroke. This is great sport where the lodges are numerous.

Musquash killed under the ice are worth two or three cents each more than in the fall, and the hunter makes frequently two to four dollars a day while it lasts.

The flesh of musquash killed under the ice is highly esteemed by the Indians. It has then its winter fat on, and is free from the objectionable odor which prevails in the spring.

The skins of the large ones, when dressed, make strong and durable lining for cloaks, coats, etc., and are made up into caps also. The "kit skins" are used in large numbers in the manufacture of kid gloves. The Hudson Bay Company exports annually about 3,000,000 skins. MARTIN HUNTER.

The Teton Timber Reserve.

VALLEY HOME, Wyo., July 29.—*Editor Forest and Stream:* A bill is now before Congress to have the Harrison reserve or timber reserve put under the control of the Yellowstone Park syndicate. The columns of your paper frequently contain articles endorsing this bill. I want to say, as a settler, that I consider this bill both unjust and useless. As a game preserve the reserve would be less useful than other land near the Park line that does not come under the survey. As a timber reserve it is the most useless piece of land, as there is positively no merchantable timber that can be cut, except what is naturally reserved and cannot be gotten out at any reasonable cost; consequently it will never be disturbed by timber merchants.

I am sure that in urging the closing of this strip of land to settlers the advocates of the proposition cannot know how much vital harm they will be doing to good, honest settlers. Because we are so unfortunate as to have a few poachers here is no reason why we, who have taken homes here and worked hard to till our land, build our houses and in fact made ourselves beautiful homes, which we have learned to love with the honest love and pride that only an American can feel for his home, should lose our all. Now, sportsmen one and all, can you see any justice in this—that for your own pleasure we should lose our homes? We have learned to love and reverence our grand old mountains; and we protest most earnestly against having them taken from us. We are genuine Americans, not poachers and law breakers, as we have been represented; and some of us will lose more than any one of you can ever realize—in losing our homes. I tell you that taking our homes from us will not be conducive to preserving the game. You see, our homes were taken up and made before President Harrison ever issued his proclamation, and should we submit to laws passed (taking our all from us) by men who do not know anything about the country they are thus closing to settlers? I tell you it is wrong, it is unjust, it is decidedly un-American.

This strip of land contains ore that would make the State of Wyoming one of the richest States in the Union if it were developed, and long before Harrison's proclamation was ever issued our prospectors had discovered and located mineral claims, and developed them to such an extent that their dreams of wealth seemed near fruition, when most unjustly Harrison issues a proclamation that dampened their ardor. Now others would take hold, and try to have us robbed of our homes, merely to preserve game for their own pleasure. I protest that it is both unjust and selfish. You would say: "You'll be paid for your claims!" and I tell you that we never will be paid the value of what we will lose. To those who read this I will make an earnest appeal. Please do not try to influence the Government to take our homes from us. We love our homes, and this land will make better homes for honest settlers than any other use Uncle Sam can put it to. I am not eloquent with my pen, but I want to make a plea for my rights, and I know all home-loving sportsmen will sympathize with my sentiments. JAS. L. MCLAUGHLIN.

ISHAWOOD, BIG HORN COUNTY, Wyo.

[The Hansborough bill in the Senate would extend Park control over the Teton timber reserve and to the south of the Park limits, as shown in the sketch map in our issue of May 7, 1898. See also the letter from Mr. Nowlin in that issue.]

Snipe Shooting at Currituck.

JUST as the sun came peeping up out of the ocean with a balmy south wind fanning our brows, and a mocking bird sweetly singing on an island near by, we placed our decoys in a sandy pool about 2in. deep, where we had seen countless thousands of them the evening before, and knew that the only question of a fine bag was how we held the guns. My companion, Eddie Johnson, is a fine shot, while the writer thinks he knows it all (or did). Well, we are all ready, and here they come—three winter yellowlegs. They seem to have no fear and swoop down among the decoys, we stood up, put them to flight, and bagged the lot. The next flock, five minutes later, was nine dowitchers; they decoyed beautifully. Eddie killed three with the first barrel, two with the next, while I killed two with each. We hardly had time to load when three large willets came hovering over the decoys. We gave them four barrels, scoring a clear miss. "Mark north," called Edward. Looking up, I saw about fifteen yellowlegs just sweeping the tops of the grass; they were soon within easy range, and four of them lay fluttering on their backs.

"Look out behind, Jack." It was a long shot, but they flew very thick and four summer yellowlegs responded to the discharge of the two barrels. It was keen sport, and when breakfast time came, about 8 o'clock, we counted out eighty-nine yellowlegs, willets, plover and curlew.

After breakfast we took it easy until 5 o'clock in the afternoon, when we returned to our blinds. The shooting was even finer in the afternoon than it was in the morning, but we had lost the knack of doing it, and I am no longer proud. We bagged eighty-seven, however, making a score of 175 for the day.

I have been shooting for about thirty years at all kinds of game in America, but I know of nothing I would rather shoot than bay birds at Currituck. Some of my readers will complain, I know, that the bags are too large, but there is not one bird wasted, all of them go to friends who are not fortunate enough to get away at the right season.

How to keep birds:

I give below the best way to keep them. Cover the bottom of a box with fine ice, sprinkling over it a little salt, then a layer of birds, placed on their backs; then another layer of fine ice, then salt, then another layer of birds; and so on until you come to the top. Then make the top layer deeper, placing an old bag over it before the cover is placed on. Birds packed in that way will keep for three days perfectly, and the hottest days in August. If one is away for a week or ten days, repack, as above, every two or three days, and they will keep for three weeks nicely. This is a good thing to know; for the refrigerators we have in our houses are really only good for a day or two at best, while birds may be kept as above stated perfectly for a month. Do not pick nor draw the birds, but pack just as shot; to pick or draw them spoils the flavor.

The flight of bay birds seems quite as large as usual at Currituck, and they were never in finer condition.

There is an abundant quail crop in eastern North Carolina this season. I have had an occasion to drive through much of it recently, and never saw more of them. MORE ANON.

Shore Birds in Massachusetts.

BOSTON, Aug. 19.—Shore-bird shooting off the coast of Massachusetts has not yet been a very marked success for the season of 1898. L. W. de Pass has tried for summer yellowlegs off Plum Island several times, and has obtained a few birds, but such gunning has not been satisfactory, though affording a great deal of satisfaction to his son, a boy of twelve—his father allowing him a shotgun for the first time this season. The boy has actually given his father a hard pull as to the number of birds shot.

One or two remarkable flights of birds have passed along the coast, however, and some of the gunners have been on hand. C. H. Tarbox and Oscar Noyes begun early to try, as often as time and weather would permit, for summer yellowlegs at the flats along Essex River, but without any success till last Thursday. That day they were out without much luck till nearly noon. The weather was stormy—has been stormy for a couple of days—and Tarbox was sure that there should be a flight of birds. Noyes got disgusted and sat down to rest. His partner pulled on toward a good inlet or marsh, and got sight of what appeared to be a great flock of birds. He called to Noyes to come with the decoys and help put them out. He declined, somewhat in disgust with the whole business. But Tarbox put them out alone, and began to whistle. Soon the flock of birds, almost out of sight, wheeled around and made for the marsh and the decoys. Tarbox got a couple of fine shots and a number of birds. By this time Noyes had waked up and came to the shooting ground. To the surprise of both the flight wheeled about and settled in the marsh again. Both gunners got good shots with each barrel and lots of birds. Whistling again drew the birds back, with chances for more shots. This sport was kept up till the gunners had over seventy birds, and stopped from sheer exhaustion.

The next day Senator C. O. Bailey, with Noyes and Tarbox, came to the same marsh and secured forty birds. On Saturday the same gunners were at them again and secured about thirty birds. The birds were chiefly summer yellowlegs, though a few "winters" were taken. Senator Bailey says that the flight has been the best one for ten years in that section, and he has gunned about every year.

Animal Ways and Rules.

MORGANTOWN, W. Va., Aug. 12.—*Editor Forest and Stream:* The writer of the article in FOREST AND STREAM of Aug. 13, "Only One Way to Trap Coons," should be more liberal, and at least allow that there may be exceptions to any acknowledged habit or custom of animals. There are general laws which govern the habits of all animals, and it is only by studying them when finding them in their natural state that we determine what these habits are.

Heated controversies often arise from different results obtained in the practical study of wild animals. As it is only by persistent effort or mere chance that we are afforded opportunity for noting the actions of wild animals, and then only to a very limited extent, we should, when making any statement, however clearly it may have been demonstrated to us, give our knowledge as gained by our observations, and leave at least a little room to justify the statements of others, who perhaps have had equal opportunities to observe, with results entirely different.

The item referred to says: "If any one ever told you he trapped a coon in the woods, he told you what never happened! Coons can't be trapped except in one way," etc.

On one occasion I found a coon in one of my traps which I had set for other animals, on dry ground in the woods, and I am not "telling what never happened."

I have also known of coons being taken in steel traps set at their holes. We must ask the "Pohcuck coon hunter" to moderate his theory a little and allow the poor coons a chance to deviate the least bit from their regular habits, in extreme cases, giving them a chance to repent of their "unvarying" habits of "staying in their hole and starving, rather than come out over a trap." We are not disputing the statements made as to general habits, but only suggesting moderation.

We know of no system of actions laid down for any wild animals, however well founded or carefully studied, which are not violated by them on certain occasions. Any of us who have spent much time in the woods and are directly interested in the habits of wild animals have observed most unaccountable actions, so different from their usual way of doing as to cause comment, and an explanation of which we never find. Some of the oldest and most experienced woodsmen have told me of queer and unaccountable actions of animals which came under their observation but once in all their experience. Therefore it is scarcely prudent for us to say that certain animals "never" vary from certain habits. EMERSON CARNEY.

Editor Forest and Stream:

Some time ago a writer in the Florida Times-Union asserted that a coon could not be caught in a steel trap, however skilfully set, and now that FOREST AND STREAM has copied a repetition of it from the Fur Trade Review, I think it time for me to take the other side and scotch the nonsense.

If they can't do it, it is simply because they are not smart enough and not because the coon's too smart.

Three or four years ago I found that a coon, or skunk, was making a mess of the eggs in my chicken

yard, and making yellow tracks on every board that he put his foot on. As the business was not to my liking, I resolved to stop it, so I set my wits to work and devised a plan that worked like a brass button in a church box. I placed a box just far enough from the side of the building to admit a good sized coon, and then put an egg about the middle, in full view. Then I dug a place in the ground deep enough for the trap and covered it with rubbish like the ground around it.

The next morning I went to get my coon, but he wasn't there. The trap was not well fastened, and to get even with me for my meanness he stole it, and that was the last of either of them till next year. Then my next door neighbor entered a complaint against some animal that got into his coop and stole a chicken.

I went over and examined the premises and found a hole dug under the fence, about the size for a thieving coon, so I covered a steel trap carefully as before and next morning that same old coon was waiting for me with one of her three legs in the trap. I say three legs because the trap took off one of her legs when she took off the trap.

The brute was a female, and the ugliest one I ever saw. Now, if there ever was a coon that had reason to keep an eye wide open for steel traps, it was the one now under discussion. Having lost one leg by love of poultry, she ought to have known too much to lose three others. DIDYMUS.

ST. AUGUSTINE, Aug. 16.

Canadian Moose.

EDMUNDSTON, New Brunswick.—This season has been the delight of all sportsmen in regard to the number and size of trout taken. Every stream and lake seemed to be alive with this beautiful fish. Mr. Prescott, of New York, with three ladies, passed the month of July on lakes adjacent here. He speaks in glowing words of the fishing and of the beauties of the place, for recreation as well as the abundance of game, for the hunter, later on. The trout fishing in the Madawaska River, in September, is something beyond the ideas of very many men; for but a few miles from here, over a good road, in two hours, you reach the fishing (or a few minutes by railroad). The trout are all large, from 2 to 10lbs.; the latter size has never been taken to my knowledge, but I have seen one of 8½lbs., and took myself, with a very small fly, one of 6¼lbs. A rod will take from three to thirty (if they are wanted) in a morning and evening's fishing.

In September large game is often seen along the banks of the river, as on the eastern side is a forest (without a break) of seventy miles in which moose, caribou, deer and bears live in almost perfect security. This will be a good year for moose, as the strict watch the wardens kept last winter prevented the usual illegal slaughter and they are growing numerous, several being seen in the very outskirts of the town. There are many places here where moose are sure to be seen; the getting one depends on one's shooting. I have located a place for caribou and deer that is perfection; there is plenty of game, it is but an hour's walk from the road, the woods are maple and birch, very open, with cool, pure springs of water in plenty. Very high land. For a party who would like to put in a month or two I think this would be a charming retreat. This is a true tip, and I should like to see it occupied by a party who would appreciate it. There are no moose excepting an odd one in this place. The license fee to hunt is $25. Hunting commences 1st of October, as this is in the Province of Quebec. Hunting in New Brunswick begins 1st of September and this is the best month to call moose. I was out last year with a party which left here the 15th of September. We saw moose signs everywhere we went, and moose came to our tent two nights; one small pond we visited was tramped so that there seemed to be not a foot of the shallow clay bottom but had been stepped on, while the paths leading to it were like cow paths coming from the pasture. We got no moose, although we were close to them at different times. One morning, fifteen minutes from camp, we got three bears in four shots. I was extremely sorry for the gentleman who had come so far, and was such a fine man, that he did not meet with better luck, as I have known of men directly the opposite of this gentleman who have killed their moose the second day out, when they never deserved to get one. I feel confident that the party who goes in here this fall can get all the moose the law allows; but I would advise the earlier in September the better. It is two days to the hunting grounds from here, but there are moose in the vicinity where camp is made the first night, and tracks of them along the road the next day. Very few sportsmen come here; the country is large and there is no danger of getting too close together. Thinking this may strike the eye and inclination of some who desire to get to a good place, I write in all sincerity and by the rule, do as you wish to be done by. S. J. RAYMOND.

Adirondack Deer Prospects.

AUSABLE FORKS, N. Y., Aug. 17.—*Editor Forest and Stream:* Few sportsmen are as yet in this section in quest of game. Deer abound in larger numbers than usual, owing chiefly to the prohibition of hounding. The native hunters quite naturally characterize the prohibitory law as abominable, as it obliges them to dispense with their favorite sport. Still-hunting as yet fails to present attractions to those formerly accustomed to shooting deer ahead of hounds.

Yesterday a party from this vicinity startled a deer from his haunts, not far distant, and also reports finding squirrels in plenty.

Not long ago, during a ramble on Haystack Mountain, I was surprised to find a representative of the stick insects. Is that insect commonly known as finding a favorable environment in this latitude?

CHENANGO.

[Yes.]

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Where to go.

ONE important, useful and considerable part of the FOREST AND STREAM's service to the sportsmen's community is the information given inquirers for shooting and fishing resorts. We make it our business to know where to send the sportsman for large or small game, or in quest of his favorite fish, and this knowledge is freely imparted on request.

On the other hand, we are constantly seeking information of this character for the benefit of our patrons, and we invite sportsmen, hotel proprietors and others to communicate to us whatever may be of advantage to the sportsman tourist.

Some Questions and Answers.

BY FRED MATHER.

I SOMETIMES wonder if other men who write for FOREST AND STREAM get as many letters containing inquiries as come in my mail. Not only questions come, but information, suggestions and a miscellaneous lot of requests, invitations and more things than can be classified. These are all cheerfully replied to, if a reply is called for, and some, if they are readers of FOREST AND STREAM, are put off with a postal card saying: "You will be answered before long through that journal." In the issue of May 28, 1898, I picked up a lot of these loose threads and called them "Some Odds and Ends." If it seems that a reply might be of general interest, the letter is put into the box labeled "Odds and Ends," where other things of general interest also find their way, hence this article:

Do Muskrats Eat Fish?

IN FOREST AND STREAM of July 30 I said that I had always suspected the muskrat of eating fish in the winter, because it is well known that it eats animal food in the shape of *Unios*, or fresh-water mussels, but most of these rodents that I had examined were killed in summer when they were mainly feeding on vegetation. I asked: "Can any one prove that the muskrat eats fish in winter when vegetation is scant?" To this question there came but one reply, but it was such a full and complete reply that I hasten to publish it as a contribution to the life history of the muskrat. No doubt thousands of men have known for years what Mr. Held writes, but as I did not know it, and I have known the musquash as boy and man for over half a century, and as a summer burrower in my trout ponds for at least half that time, it is fair to assume that others may not know about the fish-eating habits of the muskrat.

Here is just the kind of letter that I love to receive. It is from Mr. William C. Held, Saginaw, Mich., and says:

"You ask if any one can prove that the muskrat eats fish in winter. All our net fishermen can prove that they eat fish, as they are the most destructive thing they have to deal with during the fall and winter months. They chew into the nets and then chew out again, and in this way they let out many fish before the holes are located and repaired. As soon as the fishermen have their nets set in the fall, they commence trapping around them and in this way they catch most of the rats; but there are always a few that remain uncaught, which cause trouble all winter.

"In the winter one can see places on the ice where the muskrats have carried fish and eaten them night after night. Last spring I saw a fish-box into which a muskrat had gnawed a hole for the purpose of getting at the fish.

"I have read all your articles that appeared in FOREST AND STREAM, and am pleased to say that they have proved very instructive, as well as interesting. There is one thing I wish you would enlighten me on. I have seen your illustrations in FOREST AND STREAM of the pike and pickerel, and I think there should be no trouble in identifying the pike. We have a fish here which resembles your description of the pickerel, excepting as to size, as the length of our fish never exceeds 12in. It has scales on the cheeks, and is more yellow and black in color than the pike. It is locally known as pike, pickerel, grass pike, shovel-nose and sauger.

"Is there any other fresh-water fish besides the dogfish that guards its young?"

It will take two headings to answer Mr. Held, but here goes.

Pike and Pickerel.

There are two small members of the pike family which only grow to a length of 12in. I figured one of them in FOREST AND STREAM of May 21, the *Esox umbrosus*, called *E. vermiculatus* by Le Sueur, on account of the worm-like markings on its side. Jordan describes it as "Olive green; sides with many darker curved streaks, usually distinct and more or less reticulate (net-like); fins mostly plain. Mississippi Valley, etc.; very abundant in small streams and bayous." This is probably your species.

The other, *Esox americanus*, has "dark green sides with about twenty distinct curved, dusky bars; fins plain. Massachusetts to Florida, in coastwise streams." These little pike are common in New York markets, they are not angled for, but are a good pan fish. The name "sauger" is usually applied to the small pike-perch, so called.

Fishes which Guard their Young.

Mr. Held asks: "Is there any other fish besides the dogfish which guards its young?" He refers to the fresh-water dogfish, *Amia calva*, called in the West and South lawyer, bowfin, John A. Grindle and Johnny Grindle, while in Vermont it is the "mudfish." Of this fish Mr. Charles Hallock says in his Sportsman's Gazetteer: "While the parent still remains with the young, if the family become suddenly alarmed, the capacious mouth of the old fish will open, and in rushes the entire host of little ones; the ugly maw is at once closed and off she rushes to a place of security, when the little captives are set at liberty. If others are conversant with the above facts, I shall be very glad; if not, shall feel chagrined for not making them known long ago." Mr. Hallock's book was printed in 1877, and I do not remember to have seen this matter referred to since, except that his remarks are quoted in the Fisheries Industries (1884), sec. I., p. 659.

There are many fresh-water fishes which guard their young, and it is my belief, based on the capture and dissection of many individuals, that it is the male which does the guarding. All the catfish tribe guard their young until they scatter, swimming below the little black school for several days. Black bass, rock bass, sticklebacks, and all the sunfishes guard both eggs and young until the brood separates in search of food. It is possible that the crappies also guard their young, but I do not know their habits in this respect.

There is a beautiful little fish in India, brought here for ornamental purposes, called paradise fish. I have bred them in small tanks; the male makes a floating nest of air bubbles among the weeds, and coaxes the female to deposit her eggs therein, but after she has done that he will not let her go near the nest, and hunts her to the furthest corner, sometimes killing her. He fans the eggs, and when the young hatch and wander from the nest he will take them in his mouth and return them. Some of the sticklebacks make elaborate nests of twigs, and the male takes entire charge of the household.

The Working of Ponds.

A friend writes: "No doubt you saw the different theories about the working of ponds in a late FOREST AND STREAM. What do you think of them? Who is right?"

They are right: There are different causes for this disturbance of the water. One year the mill-pond at Cold Spring Harbor, Long Island, bloomed twice, once in the middle of July, from Nostoc, which lasted four days, when the water cleared and the bass and perch were just coming to their appetites, when early in August it bloomed again with the fresh-water sponge, as described by Mr. Van Cleef. During the last bloom many sunfish and some white perch died, and the bass and yellow perch seemed to abstain from food, certainly from baits offered, until September. There is a theory that the pollen from some trees—ash, I believe, is one—cloud the water at times and the fish then refuse all baits. I know nothing of this.

Nostoc, or Nostochacex, as the quotation from the Bulletin of the U. S. Fish Commission has it, is a low form of vegetation which grows in fresh water and on damp ground. It is jelly-like, and is composed of threads which consist of globular cells, between a dozen or more of which are larger cells, and these are thrown off and float by thousands in the water. On land I have seen masses of it in the swamps from 3 to 5in. in diameter, covered with jelly, and so like the egg-masses of *Amblystoma*, or salamanders, which are often improperly called "lizards"—the true lizards have scales, and do not live in water, but love the sun—that one had to look twice to tell the difference. Nostoc is of a bluish or greenish color, and the egg bunches referred to are whitish, slightly opaque. There are many species of Nostoc, but all have the characters given above.

The fresh-water sponges, as Mr. Van Cleef says, throw off great quantities of spores and cloud the water. These sponges also have many species, are very tender and difficult to detach from wood or stone, for preservation entire, because they are so tender. Being animal, their decay often renders the water in the reservoirs of cities very foul and fishy." Then people complain of the fish in the reservoirs, but live fish do not pollute water.

Pulling Teeth with Bullet Moulds.

Prof. F. A. Bates, South Braintree, Mass., writes: "I have read 'Men I Have Fished With' and received both pleasure and profit from it. It is all interesting and natural from first to last, except that yarn of your pulling the trapper's tooth with a bullet mould, in the wilderness. I do not own such a thing as a bullet mould, but I took a nutcracker which is jointed just the same and tried to see how such a thing could be used on 'a pre-molar on the right side of the lower jaw.' Will you kindly explain how such a thing could be done?"

Certainly, Professor. You are an authority on game birds, and know quite a lot about fish, but of the ancestry and development of the bullet mould you have but a smattering. The modern bullet mould is hinged at the end and often has places to run three bullets, all of the modern, long kind. I never saw such a mould until in the early fifties, and in my trapping days all hunters used round balls. The mould which I used was hinged like pliers, or pincers, and had a hollow bulb beyond the hinge to run a round bullet, and it ran 30 to the pound. We knew nothing of calibers, but reckoned them by the number to the pound, "squirrel rifles" running as small as 120.

No doubt such moulds as we used are no longer seen, hence your being puzzled to know how it was done. If you will read page 245 again, you will see how the old Frenchman had filed the mould into something like forceps. The old bullet moulds have gone with our powder horns, hickory ramrods, greased patches and percussion caps. With a modern hunter's equipment Antoine's "toot" would have ached until we left the woods the next spring. And that's all I know about bullet moulds.

Care of Goldfish in Globes.

A lady says: "I am unfortunate with my goldfish. I have a globe 10in. in diameter, and I buy a pair of fish about 5in. long every little while, but they die. I change the water every day, and feed them well, but they do not live. Can you help me? My husband takes FOREST AND STREAM and reads your articles. He advised me to write to you, therefore I take the liberty of troubling you."

No trouble at all, madam, an answer in FOREST AND STREAM on this subject may help others, for your trouble is quite a common one. Your fish are large for the globe. Get a handsome pair, black and gold, about 2in. in length, and keep them out of the sun. Fish breathe oxygen, which they get from the water, which

in turn gets it from the air. The surface of your globe could not absorb oxygen enough for such large fish. It is common to see an overstocked globe with the fishes poking their noses into the air in order to take some into their gills with the water. They are suffering when they do this and may be relieved by pouring part of the water into a basin and putting it back; the fish will then settle down and breathe naturally for a while, until they exhaust the supply of oxygen again. The trouble will always exist as long as the globe or tank is overstocked, until some weaken and die, and so leave less fish to use up the oxygen.

Careless changing of the water is a fruitful cause of shock, especially in winter. When you reflect that bodies of water are slower to change their temperature than the air is, you will realize that fishes are not accustomed to as sudden changes as are animals, which live in air, and when the water in your globe has acquired the temperature of your room, and that is thrown out and water twenty or more degrees colder is given them there is a shock to the fish; it may not kill, but tends to weaken them, and continued shocks may kill. It is better to use the old water, pouring it back and forth in the air, and then it is fresh water, because it has absorbed all the oxygen that it can hold. This is a principle not generally understood. We fishculturists seldom use new water when traveling with fish. We aerate the water in the cans at regular periods, either by drawing a bucket full off with a syphon, and shaking it up well before putting it back, or by filling a garden syringe with water and then holding it high, force it down among the fish.

In a "balanced" aquarium the water is never changed, only enough to supply the evaporation is added. But water plants which grow with submerged leaves are planted or allowed to float if that is the nature of the plant, and they throw off oxygen sufficient for a limited number of fish. The balancing of animal and plant life is the object.

Try some small fishes, get some plants from the ponds or of a dealer, put a little coarse gravel in the bottom as an anchorage for the plants and to absorb all dirt; then you need not clean the tank or globe more than three times in the summer, mainly to remove the green growth on the glass, which is beneficial, but unsightly.

Now for the "don'ts." Never take the fish in your hand; use a small net. Don't feed them more than they will eat, because the refuse fouls the water. There is a prepared food for goldfish made from rice, which is very good, but see that you stop feeding before they stop eating.

If your fish die it is due to one of these causes: overcrowding, bad water, starvation, handling, or shock by sudden change of temperature. Try it again with small fish, you will like them best, and with the above rules in mind there is no trouble in keeping goldfish healthy.

Hybrid Fishes.

H. F. asks: "1. How far can hybrids be produced among fishes? 2. To what degree are they fertile, either with one of the parent stocks or with each other? 3. Do hybrid fishes occur in a state of nature?"

A postal card to this gentleman in reply said: "Your questions received. Full and complete answers would fill a volume. Watch the columns of FOREST AND STREAM for the next month or two, for I will attempt a reply through that medium." His questions involve answers that may interest many, and so they will be considered. I like to get letters which open up questions of general interest; they have a value, and if I can't answer them satisfactorily they will provoke profitable discussion.

Now to the questions: 1. No man knows how far hybrids can be produced among fishes, because comparatively few fishes have been bred artificially, and of these the experiments in hybridizing have been mainly confined to the salmon family. I say "mainly," because the only attempt to hybridize fishes outside this family, known to me, was made by the late Seth Green, who claimed to have successfully crossed the striped bass and the shad. We know that animals must be closely related to hybridize, and that few hybrids are fertile. The dogs will not interbreed with the cats, including the wolves and tigers. The dog and the wolf will cross, but the dog and the fox will not. The wild "Canada" goose will breed with our tame geese, but the progeny is infertile with either parent or among themselves. The same is true of the horse and the ass, which can produce the useful mule without which our armies would be impotent, and who "without pride of ancestry, or hope of posterity," threw his weight into his collar and pulled the artillery out of the mud. Horses would have fretted to death at this time, but the mules chewed a splinter from the neck yoke, received a lash that cut in deep, heard the objurgations of the driver, and the battery went on.

Animals so near together either refuse to breed or produce infertile progeny, called "mules," for the term is applied to all infertile hybrids, such as crosses between the goldfinch and canary birds, and is not restricted to the hybrid animal which serves our armies as neither of its parents could do. The hybrid geese referred to are "mules," that term simply means an infertile hybrid.

I have never believed that the shad, with its soft fins and other differences of structure, produced a hybrid with the hard-finned striped bass, two fishes as much unlike in structure as the goat and the rabbit. I am aware that the late U. S. Fish Commissioner, Col. McDonald, thought this might be possible, but where is the hybrid? Mr. Green no doubt put the bass milt on the shad eggs, and may have hatched fish from the eggs, but the water was full of the milt of shad, all about his boat, and his dipper may have taken some in when water was put on the eggs and so a few were impregnated, but he did not preserve samples of the fry, and there is no proof that the shad eggs were impregnated by the bass milt.

All who knew the late Seth Green, personally, knew that he trusted all detail of his work to his employees.

To question No. 2, I can only say that most of the salmon family appear to produce fertile hybrids, as far as the trouts and salmons are concerned, but no experiments have been made to my knowledge with the different whitefishes, smelts, etc., which "belong" to the family by reason of some such slight affinity, such as having the second dorsal fin composed of fat instead of rays.

I never practiced hybridizing of the *salmonidæ*, because I saw no use in it further than to experiment to know if it could be done, and as this had been demonstrated by others I was satisfied in my work for the State, on Long Island, to breed only straight pure stock, and when I left the place there was not a hybrid in the ponds. I have read in the papers an assertion from the present State Superintendent of Hatcheries that at Caledonia Station the trout were so mixed as to be of little use for breeding purposes.

I have produced hybrids, in great numbers, between the shad and the alewife or "herring," as it is called up the Hudson, but there was a reason for it. We could not keep shad alive after capture; they seemed to die from fright, and when, at a haul of the seine, we found one or more spawning shad and no males, we took the eggs and milted a "herring" over them. This on the principle that some kind of a fish was better than no fish. These eggs hatched freely, and we turned the fry loose at the proper time, but I never saw an adult fish in the Hudson that seemed to be a hybrid. Green also did this, and the fishermen learned of it and began to look for the "bastard shad," as they termed them, and in their ignorance of species they picked out the hickory shad, or mattowacca, *Clupea mediocris*, as the degenerate. The press along the river, then inspired by local fishermen to be hostile to fishculture, took up the cry and abused Green for debasing their shad, which they termed "rebel shad," the first of this species having been noticed by them about fifteen years after the Civil War.

The fact is that this last named species is indigenous, not only to the Hudson River, but to all rivers from Cape Cod to Florida, but in their ignorance the fishermen had not noticed the fish, or had forgotten it, and as it was an inferior fish they blamed Green for it, assuming that it would interbreed with the true shad and so tend to debase that fish in the river. On several occasions, while in the employ of the State, I talked with the fishermen, and tried to show them their error, but they had "fished all their lives," and how could any man know more about fishes than they?

This "hickory shad," "tailor shad," or "tailor herring," for it bears all names, has the same number of rays in its dorsal and anal fins as the shad, but its scales are larger than that of the true shad, having only fifty in the lateral line, while the shad has ten more. This, however, has no weight with a shad fisherman; he thinks he knows fishes by sight, and as for fin-rays and scales in the lateral line, bless you, a man who undertakes to tell him what a fish is by such trifles is wasting his time. He is a fisherman, and "he knows a fish when he sees it, and all the professors, who know fish from book larnin'," can't teach him a thing."

Now that the hickory shad exists in the Hudson, and the fisherman do not seem to know it, let me say that this fish has faint longitudinal streaks upon its sides, which, McDonald thinks, may have caused it to be named from a sort of cotton goods that is striped. It is more abundant in Southern rivers.

It is a fact that all infertile hybrids, "mules," if they live and thrive, excel one or both parents in some quality. Many hybrid geese—the product of Canada and the tame goose—come to New York from Pennsylvania, and are larger and better than either parent; as much so as a capon exceeds an ordinary fowl in size, tenderness and flavor. The same rule holds good in many other forms of life which the limits of this article forbids mention.

With that as statement leading up to a fact, let me cite the fact that Mr. E. G. Blackford has reported that he has seen 18lb. shad taken on the Pacific coast. Green sent the first shad there, but there is no proof that any of his fry were hybrids; yet it is possible that there might have been hybrids among that first planting. Within the last few years shad of 8 and 10lbs. have not been uncommon in the Hudson, while twenty years ago a 6-pounder was thought large and very rarely was one of 8lbs. taken.

To the third question I will say that I never knew hybrid fishes to occur in nature. All animals prefer to mate with their own kind. Nature abhors a mule, and limits it to one life, with no progeny. I have known a wild mallard to mate with a black duck and raise a brood, but the birds were wounded and could not fly, and they had no choice. This was on the Pamunky River, Va. Some men regard every animal which they are not acquainted with as a hybrid. When the grayling was first brought to notice in America, a man wrote to a sportsman's paper giving it as his opinion that the grayling was a cross between a trout and a sucker, and that man was a fish commissioner of Illinois at the time. He was known as Dr. Pratt, but he dropped out of sight soon, yet, by virtue of his office, his words had the weight of authority. I doubt if fish ever hybridize when wild. Lake and brook trout are prevented from doing it by accident, the lakers spawning at night, any milt that might reach a brook trout egg would be dead before morning, when the latter lays its eggs.

New Jersey Surf Fishing.

ASBURY PARK, N. J., Aug. 20.—Much the same conditions prevail as in my last note in relation to surf fishing. Weakfish and kingfish are fairly abundant along shore, and are being taken every day by those who consult proper times and baits.

One fact in relation to the kingfish is that they have stayed with us steadily from the time of their first arrival, with the exception of one period of only a few days in extent. This is quite contrary to their usual custom, as it formerly has suited their fancy to quit biting about July 25, and remain inactive, so far as the angler was concerned, entirely during the month of August.

That they are consorting with the weakfish and feeding on the same tides is demonstrated by the fact that of two catches recently made by Judge Guild and myself, of forty-seven and thirty-one fish, of the former thirteen were kingfish, thirty-four weakfish, the latter eight kingfish, twenty-three weakfish. These were taken in the surf, casting from the beach.

Bluefish are very abundant off shore, but only occasionally one is taken from the beach. The first salt-water catfish ever taken in these parts so far as can be learned was caught by Druggist A. A. White, a few mornings since. It is a great rarity in these waters.

LEONARD HULIT.

CHICAGO AND THE WEST.

The Men of Beaver Islands.

Deputy Warden C. E. Brewster, of Michigan, has been acting warden for a few weeks, and has made a long trip over certain parts of the State. Among other regions he visited the Beaver Islands, a group of little known but peculiar communities which are well worth the attention of inquiring novelists in search of new country to exploit. The Beaver Islands are a world by themselves, and hold one of the most clannish populations to be found in America. It is only once in a while that one hears from this far-off part of the world, for the upper part of the Great Lakes is not much quoted in traffic schedules, and is best known to the fisher folk who ply those waters. Deputy Brewster found that the sturdy islanders are in open defiance of the law, saying that they intend to make their own laws. They probably never heard of the State of Michigan, and are only dimly conscious that there is a Government for the whole country, though they prefer that to any law located nearer home. The Press, of Grand Rapids, prints a very interesting article about these curious people and their opinions regarding fish laws.

"The fishermen up there," says the story—"and they are nearly all fishermen—seem quite fixed in their determination to ignore the closed season laws this year as they did last year. 'Bowery' Gallagher, a leading fisherman, and one of the supervisors of the county, stated to Mr. Brewster that he proposed to fish through the closed season in spite of the law, and so did the others. He held that the period from Oct. 30 to Dec. 15 was about the most profitable fishing season, and also maintained that the State has no jurisdiction over the Great Lakes—that it lies with the general Government. Mr. Brewster and Gallagher had some warm arguments. Mr. Brewster said that if he fished during the closed season and there happened to be a special session of the Board of Supervisors, there would be one supervisor absent. The deputy game warden discovered some time ago that last season after he had left the islands the game laws were totally ignored.

"The people of Beaver Islands constitute a class all by themselves. They live by fishing and they find it impossible to see why other people do not view things as they view them. They argue that God made the little fishes and put them in the water for subsistence, and that the State has no right to interfere. Manitou county, under the government of these sturdy sons of toil, was a queer place. Last year the Legislature consolidated the county with Charlevoix county. But still they do not see the use of fish and game laws, and they believe that the State is trying to discriminate against them in favor of Canadian fishermen.

"Another odd thing is that the islanders themselves make laws to govern their fishing that are stricter than the State laws. The fish laws permit the use of nets of 4½in. mesh for general fishing and 2¾in. mesh for herring and 'long jaws.' The islanders have agreed among themselves to use no nets of smaller mesh than 5in., and to allow no one else to come in there and use smaller nets, and as a result the fish that are shipped from Beaver Islands are larger, better and worth more than those caught elsewhere with nets of smaller mesh.

"The Game and Fish Department will have a man on the grounds all during the closed season. The laws will be enforced to the letter this season, and the folks on Beaver Islands will have to make the best of it."

Carp not Fit to Eat.

To-day I was talking with Mr. Wm. Werner, or "Bill" Werner, as we call him here. Mr. Werner is one of the best known chefs and caterers in Chicago, and he knows what is good to eat, and he can cook anything so you will think it is good to eat. I bethought me to ask him, as an expert, to answer the often disputed question: "Are carp good to eat?" Mr. Werner said:

"No, the carp is not fit to eat. It is the muddiest and meanest of all fishes. Of course, it can be cooked so that it can be eaten, and so it will appear to taste good, but that is only by reason of the spices and sauces with which it must be covered. Much is said about the carp being a cheap food fish. Upon the other hand it is a dear food fish, for the sauces needful to make it fit for food cost more than the fish itself. A food fish is one which can be eaten for itself, and without killing the natural taste with artificial and stimulating dressings."

I think our fish commission would do very well to ask Mr. Werner or some other competent authority for a recipe for a sauce which shall make the carp fit to eat, and suggest that, having determined upon such substance, they issue same to the populace with each edition of the leathery abomination which they put out. This is only fair, though it may take a good deal of Worcestershire, tabasco, allspice, cloves, and other fine herbs. Thus we should be encouraging many new manufacturing industries, which would be a good thing for the country. On that basis I should think the carp might also be a good thing. As it is, I see no reason why it should be encouraged, so long as we have that sturdy American, the dogfish, which is just as good to eat and can, moreover, show a bit of sport if you want to fish for him. If Mr. Cohen and Dr. Bartlett cannot make drawn butter and rich, condimental gravies in large quantities for free popular distribution, I can see no moral right that they have to place the carp over the dogfish.

The Fifield Lakes.

CHICAGO, Ill., Aug. 20.—The muscallonge have been rising fairly well in the Fifield Lake chain of Wisconsin for the past week or so. A number of good fish have been taken, of 10, 12 and 14lbs., the largest weighing 23lbs.

Saving the Bass.

Out at Winona, in Minnesota, the anglers are adopting the method of saving young fish which was long ago instituted by the Illinois Fish Commission. They are seining the shallow, receding pools along the bayous and bars, and taking out quantities of little bass and other game fishes, which would otherwise soon be doomed to death by the drying up of the waters. The sportsmen have gone at the matter systematically, and have hired men to seine every pool along that part of the river bed.

Another Texas Tarpon Club.

Animated by the success of the Tarpon Club at Aransas Pass, Texas, anglers of Galveston, Texas, are moving in the matter or organizing a similar club in the city of Galveston. It is stated that the tarpon fishing in the vicinity of Galveston is as good as any on the Gulf of Mexico. There is talk of trying for a club of 400 members, with an initiation fee of $20.

Ben Dicks' Big Bass.

Mr. Ben Dicks returned this week from a little trip to the Eagle River Fishing and Shooting Club, of Wisconsin, and he brought with him abundant proof of his skill, including a magnificent small-mouth bass, which I think was as fine a specimen of that species as I have ever seen. This fish was caught in Smoky Lake by still fishing with minnow bait, in about 50ft. of water. The fish weighed 5½lbs. when taken, and weighed 5lbs. 2oz. in Chicago. It was 21in. long and 15in. in girth, and a very clean, symmetrical fish. It was an unmistakable small-mouth, but in this fish I had opportunity to notice the great range in markings of the bass family. The small-mouth of the rivers is entirely different in appearance from this fish. The latter had none of the dark mottlings which are seen on the back and sides of the river small-mouth, but its body color was solid, something like that sometimes seen on the big-mouth bass, dark grayish green above and pearly white beneath. As I have earlier stated in these columns, I have sometimes caught bass in the Kankakee River which somewhat filled the above description. They looked like big-mouth bass, but were small-mouth bass, and again I have caught others which I, for one, was unable to classify, whether large or small-mouth. I am one of those who believe that nature got here before science did, and that nature does not always separate her classes by air-tight fences.

Among others stopping at the Eagle River club this week were Mr. Gunnison, Mr. Coyne and wife, Mr. Alex. White, Mr. C. D. Gammon, wife and daughter, Mr. L. M. Hamline, Mr. Kerr and family.

E. Hough.

1200 Boyce Building, Chicago, Ill.

In Acknowledgment of Flies.

Union League Club, New York, Aug. 15.—*Editor Forest and Stream:* My wife has just sent me some very attractive flies, selected evidently for their beautiful coloring. Of their utility I cannot write. I cannot acknowledge them in terms commensurate with her desire to please, nor adequate to the beauty of the gift. Nevertheless I must show my appreciation as best I can.

If instincts of beauty, so marked in feminine humanity, prevailed with feminine fishes, I fear our fish waters would soon be depopulated. If you swell your columns with trifles, command the inclosed. H. F. T.

In acknowledgment of a gift of flies from my wife:

With pleasant surprise
The packet of flies
Came all safely to hand through the mail.
To say "they are sweet"
Would be incomplete—
They're so beautiful—delicate—pale.
Of this there's no doubt,
If bass, perch and trout
Are taken with color like sender,
I'll take a big string,
Which homeward I'll bring—
They'll be of the feminine gender.

August, 1898.

Lake Superior Fish Notes.

Editor Forest and Stream:

At intervals comments have been made in your paper concerning the size and weight of whitefish, and the differences in the dimensions and weight of the fish have been so contradictory to my own experience that I have taken some pleasure in collecting data establishing the weights of such fish, and the points where they have been caught. The first record is of two large fish taken off Point Betsy, on Lake Michigan, which weighed respectively 22 and 25 lbs. These were genuine humpbacked whitefish, such as have been caught in that lake for the past fifty years.

My records say further, in 1897: Three whitefish caught off Lutsen P. O., on Lake Superior, in one haul of nets, weighing 49lbs. At Isle Royale, three whitefish were caught in nets weighing respectively 23, 22 and 24lbs. each. During the summer of 1897 a fine whitefish was caught off Encampment Island, on the Minnesota shores of Lake Superior, weighing 23lbs., by a Duluth fisherman in his nets. These are not troy weight pounds, but regular store scales weighed them. In June of the same year a large lake trout (namaycush) was caught up along the north shore of Lake Superior near to Thunder Bay, weighing 75lbs., and was just about all that a fisherman could haul from his shoulder. The days of large fish are not gone! nor are the whitefish getting scarce, for the fishermen report that there are more fine whitefish caught this season than they have seen for years.

During the summer of 1896 I had occasion in my correspondence to report to Commissioner Brice that an influx of blue, black fin, or long jaw, whichever they were, had seemed to have invaded Lake Superior, and were caught by the ton; so plentiful had they become that the fish dealers did not desire them; they were a drug on the market, yet nets set for other fish were crowded with these wanderers.

Recent reports from fishermen have come in saying that scarce any bluefins were caught this season, but that instead larger numbers of whitefish of good size and weight had been found in the nets and caught on the grounds that years ago used to be considered as prime feeding grounds for the Lake Superior whitefish.

It seems that these bluefins are a wandering race of deep water fish, and it is possible that the whitefish recede from the millions of them that have appeared all along the clayey grounds, shelving into the deeper water where formerly the whitefish fed.

Professor Woolman, of the Biological and Natural History Department of the Duluth High School, is preparing for the U. S. Fish Commission the result of his researches on the feeding grounds in Lake Superior of the whitefish, and is trying to learn if possible if the cause of the receding of the whitefish has been the introduction of so much deleterious matter from the cities up at the head of the lakes. This paper will be full of interest to both the student, the biological sharp and the common fisherman whose dollars come from the products of the depths of Lake Superior.

W. D. Tomlin.

[The bluefin or blackfin is *Coregonus nigripinnis*, a whitefish closely resembling the lake herring, but much larger. It is usually regarded as a rare species.]

North-Eastern Angling.

Boston, Aug. 22.—Mr. D. H. Blanchard has returned from his salmon river, the southeast branch of the St. Marguerite. The season has not been a very favorable one at that river, the same as with other streams in that part of the Province, though Mr. Blanchard, with his party, succeeded in landing about twenty salmon. The fish were all large, rather than a general run of small fish. Mr. Walter M. Brackett, on the same river below, also notes rather poor success. Mr. John Fottler has returned from his salmon preserve, the St. John, at Gaspe, P. Q. He also had indifferent success, the weather being unfavorable.

The trout and salmon fishermen are still departing to some extent, though generally the more noted Maine fishing resorts are now given over to the vacationists. But these vacationists all now take fishing tackle with them, and if the quality is not quite as fine as that taken by the devotee and expert angler, why, it answers the purpose, and doubtless is fully equal to the skill of the person behind it. The season has been a most remarkable one, even if not another fish is taken from the Maine and New Hampshire waters. There have been more anglers than ever, and certainly they have taken more fish than ever before. The lover of angling can only ask if the supply is to hold out. Angling is increasing wonderfully in popularity, and the task of fish commissioners and protectors and propagators is a great one, that the supply may be made sufficient to prevent this great interest from flagging.

At the Rangeleys the noted fishing hostelries are full of guests. The Rangeley Lake House is full. At the Mountain View they have been crowded. The Moosehicmaguntic House has been well patronized. The Birches cannot take another guest at present, while Bemis is quartering all the guests possible. At Billy Soule's guests have to wait their turn to get in. At the Upper Dam there has been a full quota of fishermen all summer. The Middle Dam has been well patronized.

Mr. A. T. Waite, of the Boston Herald staff, with Mrs. Waite and their son, are off for Billy Soule's. They will try the fishing every day, and hope for success nights and mornings. Mr. E. B. Haskell, with a party of ladies, will make a tour of the Rangeleys this month, coming out via Dixville Notch. Mr. Rodney P. Woodman is determined to try the landlocked salmon again before the season ends. He will go to Sebec Lake, Me., about the first of September. He has an idea that salmon may be taken on the fly near the entrances to the streams about that time. A little later the fish are to be found in the streams. Mr. Woodman's idea is that the salmon will rise as they come from the deep water to the streams.

Special.

Lake Champlain Fishing.

Essex, N. Y., Aug. 19.—*Editor Forest and Stream:* The water in Lake Champlain is lower than in recent years. The wall-eye pike fishing is very good at present. Messrs. Leaning and Kirk, of Albany, fished an hour the other afternoon, off Split Rock Point, and caught four, the largest weighing 4lbs. Near by was a boat which reported a catch of forty-seven since morning. This was still-fishing in 60ft. of water, using minnows as bait. The pike is a bottom fish. Mr. Kirk has introduced to this part of the lake a method of deep trolling with heavy sinker similar to that used for taking lake trout. I fished in Wisconsin once for pike with an Indian who wrapped around his line sheet lead pounded out from bullets. South of Thompson's Point is a good locality for deep-water trolling, and also along the reef between Diamond Island and Split Rock Mountain. Off Ball's Point, near the Little Otter, a pickerel (pike) was recently taken by trolling, weighing 14lbs.

Chicago Fly-Casting.

At the contest held on Saturday, Aug. 20, by the Chicago Fly-Casting Club, the scores made were as follows:

	Long Distance Fly, Feet.	Distance and Acc'y, Per Cent.	Accuracy and Del'cy, Per Cent.	Bait Casting, Per Cent.
W. H. Babcock	..	82 1-3	90 1-2	..
L. L. Blackman	..	86 2-3	..	71
C. F. Brown	..	89 2-3	87 2-3	..
C. H. Chadwick	..	..	..	88 2-5
B. W. Goodsell	110	89 2-3	95 1-6	93 1-5
H. G. Hascal	109	87 2-3	94	97 2-5
E. R. Letterman	..	81 2-3	90 5-6	85 3-5
C. A. Lippincott	..	90	94 2-3	92 1-5
C. G. Ludlow	108	90 1-3	97 5-6	80 2-5
G. A. Murrell	..	88	93 2-3	93 2-5
F. N. Peet	118	94 2-3	96	95
E. A. Renwick	99	91 2-3	88 2-3	90
G W. Salter	..	75 1-3	..	93 3-5
A. C. Smith	..	85 1-3	95 5-6	91 3-5

Holders of medals are: Long distance fly, F. N. Peet; distance and accuracy, F. N. Peet; accuracy and delicacy, C. G. Ludlow; bait casting, H. G. Hascal.

The occasion was one of much interest.

G. A. Murrell, Sec'y.

Dec. 5.—Continental Field Trial Club's trials, Lexington, N. C. W. B. Meares, Sec'y.

Field Trials for the East.

Editor Forest and Stream:

I was much pleased to note in your issue of Aug. 13 an article from the pen of Mr. E. A. Spooner, pleading for the establishment of an Eastern club whose trials should be run in the East, under rules adapted to our grounds, game and conditions, and especially so as I have for the past eight months been using my efforts among our local sportsmen toward the attainment of the same end, and have gone so far as to put myself in communication with many others, in order to ascertain their views and make an estimate of the material available for such an enterprise. The information gathered goes to show that while there are very many who would give their hearty support and patronage to such a movement, there are but few who would care to take the initiative in an undertaking that would require a great deal of work and no mean executive ability.

The sportsmen—that class who love the "rough and tumble" of mixed shooting, and honest competition for sport's sake, and manly, healthful recreation—are growing weary of modern field trials and self-constituted professional judges and handlers, and long for a time and trials where merit stands above mercenary motives, and where well-bred, well-trained shooting dogs are rated above greyhounds and coyotes.

I do not deny that field trials of to-day have their uses as well as abuses; their virtues as well as their vices; but I do claim that, as they are at present conducted, they are tending more and more toward race track and gambling methods, and that any effort to put them back to their old-time prestige should receive the most hearty support of all lovers of honest, legitimate sport, whether East, West, North or South, throughout the length and breadth of the land. While I most heartily indorse Mr. Spooner's views in general, I cannot but believe that a club organized on a broader scale than any one State would meet with more general approbation and a much heartier support, and therefore beg that not only Pennsylvania, but all the Eastern and Middle States be let into the brotherhood, with a cordial invitation to sportsmen South and West as well. Give us field trials by all means, and while the time is too short to run a Derby let us have an all-age stake for 1898, with modified rules and judging, where well-broken, intelligent hunting dogs and fair-minded sportsmen, under impartial judges, can meet in friendly rivalry and feel assured of "justice to all and favor to none."

For the trials of 1898 Gardiner's Island or some other available preserve would be most acceptable; but after that give us grounds selected by a committee chosen by the club in the rural districts, where we could enjoy the charm and excitement of autumn scenery and mixed shooting; where the wary grouse, the quail and the woodcock give variety and zest to the sport, and demand of the winners all those qualities (including retrieving) that go to make an invaluable shooting dog and companion. Such grounds could be had at almost a nominal sum, and the game supply maintained by intelligent methods and a small annual outlay in money.

In the absence of something more enticing, sportsmen of the East will to a greater or lesser degree patronize trials South and West; but give them home trials, conducted and judged as we measure a day's sport afield, and note what a wave of enthusiasm will sweep away the cloud of apathy which has hung like a pall over field trials since the good old days gone by.

W. W. McCain.

Continental Field Trial Club's Derby.

HILLSBORO, N. C., Aug. 17.—*Editor Forest and Stream:* Herewith are the entries for the Continental Field Trial Club's Derby. There are twelve pointers and twenty-four setters; total, thirty-six:

The acting secretary of the Pointer Club of America has notified me that at a meeting just held it was decided to give a prize of $20 for the best pointer run in our trials at Lexington this fall; the pointer must belong to a member of the Pointer Club of America:

Setters.

Colonel.—H. R. Edwards' b., w. and t. dog (Harwick—Trap, Jr.).

Young Sport—H. K. Devereaux's o. and w. dog (Marie's Sport—Nellie Bly).

Count Danstone.—Geo. E. Gray's (Agt.) b., w. and t. dog (Count Gladstone IV.—Dan's Lady).

Young Count Gladstone IV.—Geo. E. Gray's (Agt.) lem. and w. dog (Count Gladstone IV.—Antoie).

Dashing Blyth.—Fox & Blythe's b., w. and t. dog (Antonio—Rita H.).

Rita's Flounce.—Fox & Blythe's l. and w. bitch (Antonio—Rita H.).

Nightingale.—Fox & Blythe's b., w. and t. bitch (Antonio—Rita H.).

Flavia.—Eldred Kennels' b., w. and t. bitch (Mack H.—Ida Bates).

Halberd.—Mrs. R. P. Carroll's b., w. and t. dog (Count Gladstone IV.—Iza).

Tabard.—Mrs. R. P. Carroll's b., w. and t. dog (Count Gladstone IV.—Iza).

Berber.—Miss Constance Parsons' b., w. and t. dog (Antonio—Laski).

Waddell.—Del Monte Kennels' l. and w. dog (Count Gladstone IV.—Lillian Russell).

Glad's Girl.—Del Monte Kennels' l. and w. bitch (Count Gladstone IV.—Lillian Russell).

Dewey.—Hobart Ames' b., w. and t. dog (Tony Boy—Nellie C.).

Lena B.—D. E. Rose's (Agt.) b., w. and t. bitch (Tony Boy—Nellie C.).

Pearl O.—Oakland Kennels' b. and w. bitch (Tom—Countess Christine).

Marie Girard.—Jackson-Denmark Kennels b., w. and t. bitch (Count Gladstone IV.—Lillian Russell).

Stampede.—Miramonte Kennels' b., w. and t. dog (Dash Antonio—Belle of Detroit).

Flyaway.—Miramonte Kennels' b., w. and t. bitch (Dash Antonio—Patty B.).

Hope's Lil.—Miramonte Kennels' b., w. and t. bitch (Hope's Ridge—Suver G.).

Pink's Boy.—P. Lorillard, Jr.'s, b., w. and t. dog (Gleam's Pink—Belle of Pawling).

Jean de Reszke.—P. Lorillard, Jr.'s, b., w. and t. dog (Gleam's Pink—Dell V.).

Schley.—P. Lorillard, Jr.'s, b., w. and t. dog (Tony Boy—Fush o' Dawn).

Jubilee Flo.—Thos. Johnson's b. bitch (Little Billee—Belle W.).

Pointers.

Zephyr.—Jas. S. Crane's b. and w. bitch (Rip Rap—Jingo's Joy).

Lad of Jingo.—W. P. Austin's liv. and w. dog (Jingo—Dot's Pearl).

Jubilee Blithe.—Thos. Johnson's liv. and w. bitch (Rector—Dinah).

Fairview Beauty.—W. Gould Brokaw's liv. and w. bitch (Sir Walter—Fanny Davenport).

Lady Fairview.—W. Gould Brokaw's liv. and w. bitch (Sir Walter—Fanny Davenport).

Matt of Cotton Grove.—Victor Humphrey's b. and w. bitch (Rip Rap—Croxie Kent).

Zenda.—Victor Humphrey's liv. and w. bitch (Hob-Nob—Castaway).

Drum Major—J. P. W. Brouse's liv. and w. dog (Rush of Lad—Queen Kent).

Mogul.—Charlottesville Field Trial Kennels' b. and w. dog (Rob—Heatherbelle).

Ranee.—Charlottesville Field Trial Kennels' b. and w. ticked bitch (Rip Rap—Toxic).

Nana.—Charlottesville Field Trial Kennels' liv. and w. bitch (Rip Rap—Toxic).

Hindo.—Charlottesville Field Trial Kennels' liv. and w. bitch (Rip Rap—Toxic).

W. B. MEARES.

Answers to Correspondents.

C. H. F., Sherbrooke, P. Q.—Will you kindly give us a decision in the following case: A holds challenge cup. B challenges and wins. C offers challenge to B at once, but B says: "D has already challenged me, having done so provisionally, should I win." Does D's challenge rank ahead of C's? or is it a correct challenge? Ans. Such provisional challenge is void unless the conditions governing the cup specially permit such challenge. B had no standing to accept a challenge. He could not make any provisions in a matter wherein he was as incompetent as any other non-holder. As an abstract proposition, such provisional challenge contains a principle pernicious to recognize, as the holder of a cup would thereby be able to block open competition, and procure challenges from such weak men that successive victories would be a certainty. This feature is entirely apart from the question you ask, but is advanced in a general way, as showing the impropriety of such challenges being allowed.

E. G. B., New York.—Will you oblige a subscriber with answers to the following questions: 1. What are the initials and the address of Mr. Carleton, the Maine Game Commissioner? 2. What is the name and address of the Game Commissioner for the Province of Quebec? 3. What can you tell me about the fall hunting in the region of Lake St. John? Are there many moose and deer there? How do the numbers of them compare with the Maine region? Are there as great crowds of sportsmen go there as go to Maine? In other words, if one wants to get a moose would he do better to go to Maine or up to Quebec? Ans. 1. L. T. Carleton. 2. Address simply Commissioner of Crown Lands, Quebec, Canada. 3. There are said to be some caribou and some moose in the Lake St. John region. Not nearly so many sportsmen go there as to Maine. Write to N. E. Cormier, Aylmer East, P. Q., Canada.

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

THE contest for the Seawanhaka international cup, decided last week, has awakened a deep interest on the part of yachtsmen and all interested in sport. A great deal has been said in the daily papers of the States and Canada, on one side or the other of the dispute which has arisen between the two parties. The circumstances of the races and the questions which have arisen from them are of such importance as to claim all of our space this week, to the exclusion of all other yachting news for the time being.

Seawanhaka International Cup.

THE unfortunate developments of the past week are of a nature that almost justify the pessimistic views expressed of late years by some of the English yachting journals, to the effect that international races are not desirable in yachting, for the reason that they inevitably result in mutual ill-feeling. We should be sorry to believe such is necessarily the case; and we sincerely hope that the final outcome of the present difference may prove that there are at least two yacht clubs that can stand the strain of a very serious difference of opinion without a break in the harmonious relations which have for so long existed between them.

The point of the dispute is already well known on both sides of the ocean, through the medium of the daily papers, a question as to the elegibility of a new variety of yachting freak put forward by the Royal St. Lawrence Y. C. as its representative in the defense of the Seawanhaka international challenge cup. While the main points of the dispute are simple enough, the side issues and the actions of the various interested parties make a long and complicated story, quite overshadowing in importance the actual detail of the races. The original points of issue are all of them strictly technical, and consequently should be discussed calmly and deliberately on their merits, but so much feeling has been engendered that there is grave danger of a purely partisan quarrel which, no matter who may prove the victor, can only injure all parties and tend to throw discredit on the sport.

The prime cause of the dispute is that the party which has opposed Dominion, including several elements, has made no effort whatever to judge the boat on her merits, but has acted from first to last on the snapshot statement that she is a catamaran. So far as we can learn, the Seawanhaka race committee has accepted this view and acted on it alone. The committee, being in New York, had no direct or positive knowledge of Dominion's form or construction. The numerous reports sent out to papers throughout the country by the Montreal correspondents go no further than the statement that Dominion is a catamaran.

The position taken by the Seawanhaka representatives, Mr. Crane and his party, was essentially the same, their main argument being based on the assumed decisions of the New York Y. C. in 1877 against the Stokes catamaran Nereid, and the fact that the Herreshoff catamarans of 1876 raced by themselves, and not in the regular yacht classes.

It was perhaps unintentional that a serious injustice has in this way been done to the Royal St. Lawrence Y. C., in that it has been represented far and wide as having chosen for its representative a type of craft universally barred from the yacht classes by at least an unwritten law so strong that no fair sportsman can disregard it.

Whatever the final judgment may be as to the eligibility of Dominion in the 20ft. class of 1898, apart from all sentimental considerations based on archaic models and customs, this premature and ill-grounded condemnation will have little weight with yachtsmen, however it may appear to the devotees of other sports.

Summed up as briefly as possible, the situation is this: The challenging club, the Seawanhaka Corinthian Y. C., of Oyster Bay and New York, sent as its representatives to Lake St. Louis two yachts, practically identical, and both of the same general dimensions and type as the winner of last year's races, the Canadian yacht Glencairn II. The defending club, the Royal St. Lawrence Y. C., of Montreal and Dorval, built for the defense four yachts, three practically the same as Glencairn I. The fourth yacht, Dominion, is very different from the Glencairn type in appearance, having a deep hollow down the middle of the bottom, making two distinct hulls up to a point just above the normal waterline.

For business reasons, the members of the Seawanhaka race committee, Messrs. Cromwell, Wetmore, Kerr and Sherman, were unable to be present, either before or during the races, but were in communication with Mr. Crane during the week. The final instructions of the committee were that Mr. Crane should not start if Dominion was chosen by the R. St. L. sailing committee, but leaving him to act on his judgment with Mr. Gibson on the latter's arrival.

These instructions became known on Friday to all at the club house at Dorval. At the same time Mr. R. W. Gibson, of New York, a member of the S. C. Y. C., arrived at Dorval as representative of the race committee of which he is not a member, but as he intended to be present to see the races, and none of the members of the committee could be, he was requested to act as its representative in any negotiations and on the committee steamer. It was decided by Mr. Gibson and Mr. Crane, in view of their being on the spot and more fully conversant with all the circumstances of the case, to disregard the instructions of the race committee, and to start in any event, but on Friday afternoon Mr. Gibson made a written protest to the sailing committee of the R. St. L. Y. C. against the selection of Dominion, on the two grounds that she is a double-hulled boat, and that catamarans are barred by general usage. The sailing committee declined to take this view, and selected Dominion, she sailing against Challenger in four races.

The first race, on Aug. 13, was in moderate weather. Dominion was steered by Com. Æmilius Jarvis, Royal Canadian Y. C., who came from Toronto on a hasty summons, Mr. Duggan being quite ill and under the doctor's care. Dominion fouled Challenger on the starting line, and finally beat her six seconds over the course, after a good race, but was immediately disqualified by the sailing committee. Mr. Duggan was well enough by Monday to take his old place, and in a moderate breeze Dominion beat Challenger over the triangle by 2m. 47s., Challenger fouling Dominion at one point in the race, but without affecting the result. Next day, in a breeze and sea, Dominion beat Challenger by 8m. 16s. On the last day the wind was light for a time, and Challenger led fairly over the first round, but with more wind Dominion caught and passed her at the end of the fourth leg, Challenger fouling the mark, but sailing the race out, being beaten by 2m. 27s., the foul in this case also not affecting the result.

After this race Mr. Crane received orders from Messrs. Kerr and Dresser, by telegraph, to refuse all courtesies tendered by the Royal St. Lawrence Y. C., and to return home at once; in consequence of which he and his party did not attend the dance given in their honor by the club.

This telegram gave serious offense to some of the Canadians, and there were also rumors afloat, from invisible sources, as always happens on such occasions; it was said that the S. C. Y. C. was about to make a formal demand for the return of the cup, and that it would at once repudiate the cup and refuse to have any further connection with it. There was the usual undercurrent of gossip and rumor on both sides, that, while not coming from the principals, tended to produce mutually strained relations.

On Friday afternoon the sailing committee held a meeting in Montreal, at which it was decided to return the cup to the Seawanhaka Corinthian Y. C., with a statement of the reasons therefor.

The Conditions.

The conditions of the races were much the same as last year, with the exception of the limitations to helmsmen and crew, as follows:

Conditions Governing the Cup.

Article I.—The cup shall be known as the "Seawanhaka International Challenge Cup for Small Yachts" and shall be preserved as a perpetual challenge cup for friendly competition between foreign countries. The term "foreign" as used in this instrument shall be so construed as to permit contests for the cup between any country and its colonies and dependencies, and between such colonies or dependencies themselves.

Article II.—Any organized yacht club in good standing of any country, foreign to the country of the yacht club in whose custody the cup may be, shall always have the right to challenge for the cup, and to sail a match therefor, provided that such challenge shall be made and such match be sailed in accordance with the terms and provisions of this instrument.

Article III.—Matches for the cup shall be limited to yachts, propelled by sails only, whose racing measurement or size shall not exceed the maximum limit of the so-called "Twenty-Five Foot Racing Length Class" or fall below the minimum limit of the so-called "Fifteen-Foot Racing Length Class," of the Seawanhaka Club, as such classification exists at the date of this instrument, or whose racing measurement or size, according to the rules of the club having at the time of challenge the custody of the cup, falls within limits of size substantially corresponding to the limits above specified.

Article IV.—All matches shall be sailed between a single yacht on behalf of the challenging club and a single yacht on behalf of the challenged club. Neither club shall be required to name its representative yacht in advance of the races, but the match shall be sailed to a conclusion between the yachts selected for or sailing the first race thereof, and no substitution of one yacht for another shall be permitted after the preparatory signal of the first race has been given.

Article V.—A match shall be constituted of not less than three or more than five races, and shall be awarded to the club whose representative yacht shall win a majority of such races.

Article VI.—The representative yachts of the challenging and challenged clubs must be constructed in the respective countries of such clubs. Centerboards or plates or sliding keels shall always be permitted in construction, and no restriction shall be placed upon their use. All ballast must be fixed.

Article X.—The helmsmen, sailing the representative yachts in the match, must be amateurs and must be residents of the countries of their respective clubs. The challenging and challenged clubs must name in writing, each to the other, or to their respective representatives, at least twenty-four hours before the day appointed for the first race, the helmsmen who will sail their representative yachts, and such helmsmen shall sail such yachts in all the races of the match unless prevented by illness, or other substantial cause, in which event substitutes will be allowed.

Article XI.—The challenging and the challenged clubs may, by mutual agreement, fix and decide all the terms and conditions of the match, whether relating to dates, courses, rules of measurement, sailing regulations, notices or any other matter whatsoever pertaining to the match or preliminary thereto, and may also by mutual agreement waive for such match such of the provisions of this instrument as would otherwise govern the match or the preliminaries thereof, provided, however, that the limit of the racing length or the size of the competing yachts shall in no event exceed the maximum limit as established by this instrument in Article III. thereof, unless the consent in writing of the Seawanhaka Club to so increasing such limit shall first have been obtained.

General Regulations Governing the Match for 1898, Between the Representative Yachts of the Royal St. Lawrence Yacht Club, of Montreal, Holder of the Cup, and the Seawanhaka Corinthian Yacht Club, of New York, Challenger.

Article I.—The courses shall consist of a triangular course and a course to windward and leeward and return. Each leg of the triangular course shall be one and one-third nautical miles in length, and shall be sailed over three times, making a total of twelve miles. The course to windward and leeward and return shall be two nautical miles to each leg and shall be sailed over three times, making a total of twelve miles.

Article II.—The start shall be a one-gun flying start, with a preparatory signal.

Article III.—The races shall be sailed without time allowance.

Article IV.—Yachts must not exceed 20ft. racing length (S. C. Y. C. measurement).

The formula for determining racing length under the S. C. Y. C. rules is as follows:

$$\frac{\text{L.W.L.} + \sqrt{\text{Sail Area}}}{2} = \text{Racing Length.}$$

Article V.—A yacht's draft of hull or keel shall not exceed 5ft., and with the centerboard down shall not exceed 6ft. Draft shall be determined when yachts are in trim for measurement. Centerboards shall be so constructed that they can be wholly housed without leaving any projection below the hull or keel.

Article VI.—Yachts shall be measured without crew on board, but instead thereof a dead weight of 450lbs. shall be carried amidships, approximately at the center of buoyancy, during measurement. The total actual weight of the crew, including all clothes, personal apparel and belongings worn by them or carried on board during any race, shall not exceed 600lbs.

Article VII.—Shifting ballast shall not be allowed. (Weighted centerboards shall be considered as fixed ballast.)

Article VIII.—No outrigger or other mechanical device for carrying live ballast shall be allowed.

Article IX.—The factor of sail area, used in determining racing length, shall be ascertained by adding to the actual area of the mainsail, computed from its exact dimensions, the area of the fore triangle. The hoist of the mainsail when measured shall be plainly marked on the mast and its outer points on the boom and gaff or other spars, used to set the said, and the sail shall not be set beyond these limiting points. The fore triangle shall be determined by the following factors: (1) The perpendicular shall be the perpendicular distance between the deck and a point on the forestay, above which the jib shall not be hoisted. (2) The base shall be the distance between the forward side of the mast at the deck and the point of intersection of the forestay with the bowsprit or hull.

Any jib, when set, must not extend beyond the upper and forward points above defined.

Sails shall be limited to mainsail, jibs and spinaker. The total area of the mainsail and fore triangle shall not exceed 500sq.ft. The area of the mainsail alone shall not exceed eighty per cent. of the total area. The area of the spinaker, measured as a triangle, whose base is the length of the spinaker boom measured from its out end, when set, to the center of the mast, and whose perpendicular is the distance from the deck at the foreside of the mast to the spinaker halliard block, shall not exceed twice the area of the fore triangle.

Article X.—The spinaker boom when used in carrying sail shall not be lashed to the bowsprit or stemhead.

Article XI.—The helmsman or helmsmen and crew shall be amateurs, and the total number of persons on board shall be limited to four. The helmsman may be changed at will, and as often as may be desired in any race, provided that such helmsmen shall have been named in writing, as required by the provisions of Article X. of the Declaration of Trust.

The Challenging Yachts.

The Seawanhaka C. Y. C. was this year, at last, represented by two yachts, from which a final choice was to be made before the first race. Both were designed by Clinton H. Crane, of New York, and they were practically identical in dimensions and type. Seawanhaka, already described, was sailed in the trial races of last month at Oyster Bay, winning the series. Challenger was a new boat, shipped direct from Ogdensburg to Montreal just before the races.

During the winter Mr. Crane attended the School of Naval Architecture at Glasgow University, and the designing of the challenging yachts was made a part of his course of study. The three boats, Seawanhaka, Challenger and Cicada, are all practically alike, and differ from last year's boats, Alanka and Momo, in a much closer resemblance to Glencairn II. The freeboard is greater, the over-all length, especially forward, has been increased, the bowsprit has been discarded, the weight of centerboard has been greatly increased, the bathtub cockpit has been discarded, and the construction has been materially lightened. The lines of the boats, as originally designed, are very fair and yacht-like for this type of craft, intended to sail only on the side; and in point of dimensions and form the differences between the three boats themselves as well as between them and the Duggan boats, Strathcona and Speculator and the old Glencairn II., are so slight that even an expert in this type of craft would be puzzled to pick the best. It seems now that the possibilities of this type under existing conditions have been completely exhausted by both Mr. Crane and Mr. Duggan, and that the mere chance of the weather might determine the winner. Two noticeable features of the Crane boats are the rig, which is lower and broader than in last year's boats, and the size of the cockpit, about 4ft. wide and nearly 12ft. long to the eye.

The construction worked out by Mr. Crane is novel and ingenious. The theory is that the framework of the hull, apart from the skin and deck, shall constitute a truss or a system of trusses capable of taking all strains of mast, centerboard and crew; the planking and decking being disregarded entirely as an element of strength, their sole use being to keep the water out. As a means to this end, Mr. Crane has used two fore and aft girders, from bottom to deck, about 4ft. apart, the upper and lower members being of light angle steel and the lattice work of bicycle tubing. From the lower fore and aft member of each girder, at intervals of about 15in., runs an inclined strut of bicycle tubing, up to the clamp. The two girders are connected by cross floors of light wood, with holes bored for additional lightness. The frames and deck beams are of very small size, and the planking and decking is about 3-16in. In Seawanhaka the skin is of edge-nailed strips, full 3-16in., the deck being laid "in-and-out" like the plating of a steel ship, the projecting edges helping to give a hold for the feet. The illustration of Seawanhaka shows her condition after sailing the trial races. The hull is very unfair and lumpy in different places, and the bow shows a distinct pulling up, causing a serious alteration of form.

Challenger is the handsomest craft yet turned out in the class; when she came to Lake St. Louis she was a model of fine work. Her form was perfectly fair, and the construction would pass the strictest scrutiny in all parts. The work on all three of the Crane boats was done by the Spalding St. Lawrence Boat Company, of Ogdensburg, and in all details, of hull, fittings, spars and rigging, is as near to perfection as has yet been reached in this era of elaborate sailing machines. Challenger was planked with white cedar, but the strake below the wale was of mahogany, with transom of the same wood. The effect aimed at by Mr. Crane was to diminish the apparent freeboard by means of the dark strake, and in this he was successful. The boat was varnished all over; while Seawanhaka, originally enameled white, had been turned to a yellowish tint by polishing and varnishing. The spars were absolutely faultless in material and construction, without a knot or blemish.

Mr. Crane's first object this year has been to reduce weight, especially where it does not count as ballast, and to this end he has reduced the area of the deck by a very large cockpit, and cut the thickness of deck and skin to the very last limit. The deck was 3-16in., so thin that an incautious step or an accidental slip, even on the part of a light man, would split it, as happened to Seawanhaka at Oyster Bay, and to Challenger during the cup races. The latter boat was intended to last through three to six days of racing on Lake St. Louis, and nothing more, it never being expected by her designer that she would be turned to any useful purpose. Her planking was just 3-16in. as worked, and this was decreased in the finishing. With an over-all length of about 32ft., a beam of 8ft. 3in., as stated, a centerboard of 400lbs, with 500sq.ft. of sail, and a crew weighing 600lbs., it was expected that the trusses would carry all strains, and that the planking would hold for about a week.

As the results proved, this calculation was wrong. The trussing held fairly well, though after the first race the original fairness of form had begun to disappear, new humps and hollows being visible each succeeding day, but the planking began to split from the start. When taken in tow for the first race, Challenger bumped against Dominion, and a hole as big as a silver dollar was made in her starboard side, in addition to one previously received in handling in transit. After this race she showed checks in places, and after the hard hammering in the sea on Tuesday the planking was virtually wrecked. A bad hole under the starboard bow near the chainplates was laid to a collision with a log or similar wreckage on the leg up toward Beaconsfield, but in addition to this the planking was badly checked in many places, and the seams started and nails drawn. The bottom strake of planking, where the keel would be if there had been one, was of oak, and it was split and checked for a length of several feet. One place on the port side, where a check made on Monday had been mended by a thin piece tacked inside, showed a new check just below the piece. Temporary repairs were made to enable the boat to sail the fourth race, but it is doubtful whether she would have been at all safe for another race in a heavy sea. It was found so dangerous to tow her in a sea, at any speed and with the greatest care, that on Tuesday she sailed the four miles from the club station to the start. To all appearances, both boats were used up when they left Dorval, though it may yet be possible to utilize them by stiffening the frames and replanking and decking.

The Defending Yachts.

The defending fleet this year included four yachts, of which three were designed by Mr. Duggan. The fourth, Manitou, was designed by Mr. Huntley R. Drummond, an amateur member of the club. She was of the same type as the Duggan boats, and proved a very good boat in heavy weather. Of the Duggan boats the first, Strathcona, designed for Lord Strathcona, was very similar to Glencairn II., while Speculator differed in some details of model, but not materially. A third boat of the same type was started and well in frame, but after the trials of Dominion she was abandoned, and is now in the shop.

The construction of these boats is similar to Glencairn I. instead of Glencairn II., with the smooth-lap or ship-lap planking. The Duggan fleet of last year showed a novel and in some respects successful system of construction, with two serious defects. The framework was weak locally about the mast, and the plank fastenings, of fine iron brads, with the points turned against a stake in driving, were not strong enough. Glencairn II. went through the races all right, and was raced again this year, but some of the boats showed serious weakness in the plank fastenings. This year Mr. Duggan determined to return to the ship-lap, using for the main frames stuff about 3/8in. thick and 2in. deep, sawn regardless of the grain, one piece lapping by another. In addition to these main frames, lighter ones were bent in between. Each main frame was braced by light wooden diagonals, to make a truss, and the hull was very thoroughly trussed fore and aft in the same manner. Both planking and decking, of British Columbia cedar, were finished to a thickness of 5-16 to 3/8in., Mr. Duggan preferring a safe thickness, and also relying to a certain extent on the skin for strength. The centerboards were about the same as last year, the rudders were of a peculiar shape, broad below, and the cockpits were open to the floor, but quite small compared with the Crane boats. The illustration of Speculator shows the general points of resemblance and difference between the work of the two designers.

The rigs of the Duggan boats this year presented a contrast from that of Glencairn II., being higher and narrower, until that of Dominion really suggested Momo. In this respect the two designers have changed positions. The spars were hollow, not so handsome as those of the Crane boats, but standing well in service. The sails were made by Oldrieve & Horn, of Kingston, and were decidedly an improvement on last year; though not up to the work of Wilson & Silsby on the Crane boats.

In justice to the work of Mr. Duggan, from the beginning of the 15ft. class, it must be said that while he has sought to make the most of every new principle of design, he has at the same time, in every boat up to and including Speculator, kept as closely as possible to the conventional yacht form. His boats have all looked well under way, and have been free from such purely freak features as the bow of Alanka and similar startling innovations. In Dominion, however, he has departed from all conventional and sentimental limitations, and followed the general fashion in disregarding everything but speed. The deck plan of this remarkable craft is similar to Vagary of last year and Akabo of this, almost a parallelogram, the two ends being cut off square across, and the sides having a slight sweep. Her over-all length is 36ft. or a few inches under, her extreme beam is 7ft. 8in. at deck, and the breadth across her bow and stern is apparently 5ft. There is a good freeboard, but very little sheer. The centerline of the deck runs up to the highest point at the mast from each end, and instead of a curve in the transverse section, the round of the deck beam, there is an angle like an inverted Λ or the roof of a house. The boat is difficult to describe without diagrams, which are not now available. The beam of each hull, at the waterline, is about 2ft. 9in., with a space of some 2ft. between the two hulls. The design shows a distance of 2½in. between the surface of the water and the central portion of the bottom, with the allowed weight of 600lbs. on board; and when the boat is afloat in perfectly still water without crew on board this distance looks to be about 4in. This central portion is a continuation of the bottom, at some distance below the deck, probably 15in. at the mast, and is entirely disconnected with the deck. The name "toboggan" has been adapted to it, and it is claimed that in sailing the boat at times settles down on it, either forward or aft, thus preventing the pitch-poling that was a striking characteristic of the Herreshoff catamarans. The centerboard and rudder are the same as in Speculator, the former weighing less, and both are placed in the fore and aft centerline of the hull. The deck and side view show a resemblance to Vagary and Akabo, but below the water each bilge is dropped to form a separate portion of the hull, the overhang at each end being very long. The cockpit is comparatively small and extends to the middle portion of the bottom.

The construction is very ingenious, and apparently of ample strength. Each of the deep frames, as mentioned in the description of Speculator, is really a transverse truss, of a simple wooden construction, but very strong. A deep vertical keelson of wood is worked along the bottom of each hull, and also along the center of the middle portion, with diagonal bracing. The mast is suspended from two fore and aft pieces of oak, which rest on top of the trusses, by four steel bolts supporting a step block. The chainplates run well down the frames, inside the planking. Lanyards are used instead of turnbuckles, the latter not being readily obtainable in Canada; as there were numerous other small fittings required, it was not considered worth while to waste time over turnbuckles when the same end could be obtained by lanyards. Both planking and decking are shiplap, about 3/8in.

All of the previous Duggan boats, including the 15-footers of 1896, have been finished with a special preparation of potlead, but there has been a general comment among spectators on the superior appearance of the Seawanhaka boats, El Heirie, Momo and Alanka, all bright. While this counts for little, this year Mr. Duggan has taken to the bright varnish finish for Speculator and Strathcona, and Dominion has been enameled white. The polishing coats of varnish have turned this to a yellowish tint, but she is light enough to show to advantage on the water. A careful inspection after the hard work of the third race, in a heavy sea, showed some slight breaks in the previously smooth enamel along the seams of each hull amidships, indicating some strain in places, but the hull was apparently as sound and tight as ever.

While the forestay sets well inboard, the base of the fore triangle is longer than in any of the older boats, the triangle being larger, so that a very large spinaker can be carried. In both Dominion and Challenger the spinakers and spinaker booms have exceeded a reasonable limit. While the crews are larger by one man each, the increase of size of kites tends to make the work harder.

Before the Races.

The two Crane boats arrived at Lachine on Aug. 2 and 3, and were unloaded at the wharf of the Dominion Bridge Company, on the canal, being towed up to Dorval and rigged. The Crane party included Messrs. C. H. and H. M. Crane, J. H. Stackpole, Sherman Hoyt, H. C. Eno, J. R. Solley and P. R. Labouisse, with two professional sailors. Seawanhaka and Challenger were rigged and sailed against each other over the cup course for the week preceding the races. The two Canadian boats were also under way from time to time, and all four were constantly cleaned and polished to get the required surface. On Aug. 8 it was reported that Mr. Duggan was seriously ill. While his condition was exaggerated, there was some foundation for the reports in the fact that he had to stop all work and place himself under the doctor's orders. On Aug. 10 he wrote to Com. Æmilius Jarvis, of Toronto, asking him to sail Dominion on Saturday, as there was no one at Dorval who was qualified to take his place at the stick. Com. Jarvis had already declined an invitation to sail one of the Duggan boats in the trial races, and to attend the cup races, being very busy, but he dropped everything and took the train for Montreal on Thursday, arriving at Dorval on Friday morning. He took out Dominion, while Mr. Arthur Hamilton sailed Speculator, for a trial of the new boat. The great question all day Friday was as to the final selection of the sailing committee, it being practically settled that Mr. Crane would choose Challenger in preference to Seawanhaka for his side.

SEAWANHAKA.

SPECULATOR.

DOMINION.

CHALLENGER.

Mr. Gibson arrived in the morning, and in the course of the day made the following protest:

Royal St. Lawrence Y. C., Aug. 12, 1898.—To the Sailing Committee, R. St. L. Y. C., per A. F. Riddell, Esq., Chairman.—Gentlemen: The race committee of the Seawanhaka Corinthian Y. C. have instructed me to lay before you their opinion in regard to the eligibility of the yacht Dominion, which I am just informed has been selected by you to defend the Seawanhaka international cup.

We are of opinion that the universally observed custom of classifying vessels with two hulls in classes distinct from one-hulled boats, as catamarans, should

ROYAL ST. LAWRENCE Y. C. STATION, DORVAL.

Dominion. Challenger. Seawanhaka. Strathcona.

be considered as applying to the yacht Dominion, inasmuch as she has two distinct immersed hull sections and two separate waterlines, constituting two hulls, which are connected only above the waterline.

It seems to us that the reason why catamarans were not specifically barred in the agreement was because the custom of classifying them separately was so settled as to amount to an unwritten law requiring no mention. Under these circumstances, we feel obliged to make a formal protest against the selection of Dominion to defend the cup, and we appeal confidently to the sailing committee of the Royal St. Lawrence Y. C. as umpires to give this question a new and impartial consideration for the welfare of the sport in which we are all deeply interested. We cheerfully leave the decision in regard to these races in your hands, and will abide by your ruling.

We remain, gentlemen, very respectfully yours,
The Race Committee of the S. C. Y. C.
(per R. W. Gibson).

A meeting of the sailing committee was held, lasting until a late hour on Friday night, Mr. Gibson being present, and the question being earnestly discussed. The following decision was finally announced by the committee:

Royal St. Lawrence Y. C., Aug. 12, 1898.—To the Race Committee, Seawanhaka Corinthian Y. C.—Gentlemen: We have given your letter of this date, conveying your opinion of the yacht Dominion, mature consideration, and have had the advantage of a prolonged discussion regarding the matter with your representative, Mr. R. W. Gibson. We have reached the conclusion that Dominion comes quite within the terms of the Declaration of Trust, and the agreement covering the special conditions of the match for the present year. It is their terms which we have alone to consider, and on which our decision must be based. We might be permitted to add that, even from the point of view of ethical sporting principles, Dominion represents a new and ingenious application of recognized features in yacht designing, and is a legitimate and logical step in the line of development of this type of yacht. We beg to express our hearty appreciation of your acceptance in advance of the judgment of the committee.

We remain, gentlemen, very respectfully yours,
The Race Committee of the R. St. L. Y. C.
(A. F. Riddell, Chairman).

Pending the final decision, it had become known that a letter had been received from the Seawanhaka C. Y. C. committee in New York, instructing Mr. Crane to refuse to start against Dominion in the event of her being chosen. As none of the committee were present, however, to consider all the circumstances of the case, Messrs. Crane and Gibson decided to start on the morrow.

The experience of previous years has enabled the committee to carry off the races with little delay and trouble, and this year the arrangements were excellent. The courses were as well laid out as the waters (and the sands and rocks under them) permitted; a patrol fleet was organized of the attendant steam yachts, some of which managed as usual to get in the way themselves; but there was no trouble whatever to either competitor. The race awakened a deep interest in Montreal, and the local papers gave as much attention to it as if it were in New York and for the America Cup. The streets were blocked during each race by the crowds about the bulletin boards. The Montreal Star had its cable scows in place, and all of the papers competed in the launch and shore service. Strange to say, though both the Boston Globe and Boston Herald were represented by their yachting editors, the New York papers had none of their yachting experts present. The club steamer, the Duchess of York was run as last year from Lachine, affording a good view of the course at all times.

First Race.

Windward and Leeward.
Saturday, Aug. 13.

On Friday afternoon, after a pleasant day, a heavy thunderstorm passed over the Lake, followed by rain at times through the night, but it was clear by 6 A. M. on Saturday, though the sky was cloudy and overcast. A fresh west wind was blowing, kicking up a good sea on the Lake. The two yachts, Challenger and Dominion, were launched early in the morning, their centerboards shipped and sails bent. To accommodate Com. Jarvis a longer tiller was made for Dominion, with the usual "dog's leg." The two yachts were taken in tow of the same steamer and started for the line, off Pointe Claire, but before they had gone far they bumped together, Dominion knocking a small hole in Challenger near the starboard chainplate. Challenger had to return to the club house, where she was hauled out and repaired, starting for the line in tow of Vailima at 12:50, while Chipmunk passed a line to Dominion.

The fleet off Pointe Claire was a small one compared with last year, the weather keeping away the canoes and small craft. The club steamer, Duchess of York, carried a goodly number of spectators, and many steam yachts were out. The yachts were towed up close inshore by Pointe Claire, both setting mainsails with three reefs, and storm jibs. Challenger cast off her tow line about 1:30, just as a light rain began to fall, and ran out to the line. Dominion towed over and cast off near the committee steamer, the steam yacht Dama.

The wind was not much lighter and the sea had gone down, while a light rain fell at intervals.

At 1:55 Dominion shook out her third reef, Challenger at once following, and at 2 o'clock the preliminary signal was given, followed by the preparatory at 2:10. While waiting for the last gun the two boats kept far apart, with no inclination to bother each other. Within the last minute Dominion was just by the stern of the Dama, while Challenger was flying about inshore of the other end of the line, marked by a scow with a target on it. Challenger came for the line from inshore on starboard tack with good way on. Dominion filled away just before the gun, standing along the line on port tack. She was moving with but little way on when Challenger came up without being seen; at the last moment Dominion was luffed, but she is comparatively slow in stays at best, and still slower without headway. Challenger was forced about on port tack in order to avoid a collision, which might have been fatal to her. Both continued over the line, the foul putting Dominion to windward of Challenger.

Dominion's start was a very poor one, in spite of Com. Jarvis' known skill at the tiller, and in a one-gun start she was poorly placed, on the inferior tack, and it was her place to keep a sharp lookout. The only explanation of the foul was that Challenger was not seen until the last moment. Fortunately no harm was done except that Challenger lost all the advantage of a well-planned start, and had a lee berth instead of a weather one. They settled down to work in a fresh breeze, with a moderate sea. Dominion stood up straighter than Challenger, and worked out to windward in a wonderful way.

Challenger was the first to tack, 7m. after the start, Dominion at once following. She was now well ahead and continued to gain to the weather mark, where they were timed:

First Round—First Mark.

	Time.	Elapsed.	Loss.	Lead.
Dominion	2 39 20	0 24 20	. .. ..	0 01 50
Challenger	2 41 10	0 26 10	0 01 50	. .. ..

Dominion set one of Speculator's balloon jibs as a spinaker to port, the wind being still fresh, but Challenger set her big spinaker. She gained all the way down wind, and when they jibed she was almost up with the leader. The times were:

First Round—Finish.

	Time.	Elapsed.	Loss.	Lead.
Dominion	2 54 45	0 15 25	0 01 33	0 00 17
Challenger	2 55 02	0 13 52	. .. ..	. .. ..

They started on starboard tack, but Challenger tacked in a minute or two, followed by Dominion, the latter shaking out her second reef. Challenger followed by mostly shaking out her two remaining reefs, on which Dominion promptly shook out her first reef. Then the crews worked forward, Dominion setting a second jib, which she soon shifted for her ordinary working jib, while Challenger set her working jib at once. The wind had fallen by this time, and the sun was shining, with only a roll to the seas, the whitecaps having gone for the day. The wind was now N.W. instead of W.

As they stood over the same water as in the first round, Dominion ahead, but to leeward, worked out across Challenger's bows, gaining steadily. Challenger, being much quicker in stays, tried to tempt Dominion into a series of short tacks, but after once following her the Canadian refused the bait, and held a long starboard tack until she was ready to make a short hitch for the mark, where the times were:

Second Round—First Mark.

	Time.	Elapsed.	Loss.	Lead.
Dominion	3 19 20	0 24 35	. .. ..	0 00 55
Challenger	3 20 15	0 25 13	0 00 38	. .. ..

They ran down slowly under a hot sun, with a light westerly breeze and smooth water. When two-thirds of the leg was covered, Dominion lowered her spinaker, jibed over and set it on the other side, losing some time in the maneuver. Challenger handled her spinaker much more rapidly, shifting it over without lowering it. The end of the round was timed:

	Time.	Elapsed.	Loss.	Lead.
Dominion	3 42 35	0 23 15	0 00 41	0 00 14
Challenger	3 42 49	0 22 34	. .. ..	. .. ..

Again Challenger had made a big gain on Dominion, so that they started practically even.

With the wind now west, both, after the hitch over the lines on starboard, made a long port tack, this time in the direction of Pointe Claire. For a time Challenger footed out ahead, but Dominion worked out to windward and had a good lead, holding on until close in to Beaconsfield, when she tacked for the mark at 4:00, with Challenger at once about in her wake. On the long reach across Dominion sailed very fast, especially when she could be kept on one hull, and she made up on the windward work more than her loss in the previous round. The times were:

Third Round—First Mark.

	Time.	Elapsed.	Loss.	Lead.
Dominion	4 11 50	0 29 15	. .. ..	0 01 00
Challenger	4 12 50	0 30 01	0 00 46	. .. ..

The run down was the most exciting incident of the race, as Challenger gained steadily, and it was a question

FINISH OF FIRST RACE—
Dominion six seconds ahead.

which would finish first. After a hard race Dominion crossed the line 6s. ahead. The final times were:

	Time.	Elapsed.	Loss.	Lead.
Dominion	4 27 30	0 15 40	0 00 54	0 00 06
Challenger	4 27 36	0 14 46	. .. ..	. .. ..

Mr. Crane boarded the committee boat immediately after the finish, and Mr. Gibson wrote a formal protest, on which the sailing committee made the following decision:

Royal St. Lawrence Y. C., Aug. 13, 1898.—The race committee of the St. Lawrence Y. C., having taken into consideration the protest of the Seawanhaka Corinthian Y. C. race committee, have decided that in accordance with Article III. of Sailing Regulation 26 the race of Aug. 13 he and is hereby awarded to Challenger.—A. F. Riddell, Chairman.

Throughout the race Challenger was much the better handled, Dominion's crew doing poor work with the light sails.

Second Race.

Triangular Course.

Monday, Aug. 15.

Sunday was a very quiet day at Dorval; the weather was perfect, an ideal summer day, with a blue sky and clear atmosphere, warm, but tempered by a pleasant breeze. The two yachts had been hauled out immediately after the race, and no work was done on them. The crews spent the day visiting or lounging about the club house. Monday morning was clear and pleasant, but perfectly calm. Challenger required the attentions of a boat builder, several checks having developed in her planking, but by 9 o'clock both boats were ready for launching. Mr. Duggan was on hand early, though Mr. Shearwood was already at work, and doing all that was necessary. It is noticeable in this race, as in the two preceding years, that the principals, the actual skippers of the two boats, make it their personal work to attend to all details. They are up early every morning for such work as may be necessary, and their crews are always with them. There is no leaving of all care of the boats to subordinates, the skippers merely boarding them just before the start.

DOMINION. CHALLENGER.

As there was no wind, matters were not hurried, and it was after 10 o'clock before Challenger, in tow of Vailima, and Dominion in tow of Chipmunk, left the club pier. When the fleet reached the start, there was a long wait; a light N.E. wind just stirred the surface of the water off Pointe Claire, but the smoke from the tall chimneys of Lachine tailed away N.W., and it was very doubtful where if at all the wind would finally settle. As the triangular course was in order, it was desired to get one leg dead to windward if possible.

A number of yachts were out to see the race, with canoes, skiffs, launches and other small craft. At 12:30 the wind was S.E. over the course, moderate, and the two boats were notified that the course would be sailed with buoys to port, making a free reach to Pointe Claire, a beat to the second mark, and a reach in with wind abeam. The two boats were under way for some time, Mr. Crane with his regular crew on Challenger. Mr. Duggan was at the tiller of Dominion, with Messrs. Shearwood, Bolton and Arthur Hamilton.

The preliminary signal was given at 12:50, with the preparatory at 1:00. The boats were wide apart during the interval, one above and one below the line. Challenger came from above the line when but one minute was left, and Dominion, standing in the other direction, tacked into a fine berth on Challenger's weather bow. Her balloon jib had just been set in stops, and as she crossed it was broken out and the working jib lowered. She went over to windward and about 50ft. distant from Challenger, both moving fast, and Challenger at first going ahead, as if to get through Dominion's lee. This failed, and within two minutes of the start Challenger was luffing hard for Dominion's weather quarter. For nearly ten minutes there was a lively luffing match, both well off their course, Dominion holding her own.

At 1:15 Challenger bore off, setting spinaker to port, Dominion getting out her spinaker. Once more they luffed, and Challenger, on Dominion's weather beam, fell away until she fouled Dominion's spinaker boom. They were now so near the mark that it was necessary to jibe. As they ran down, Challenger at last got by Dominion to windward and had a clear lead of about 50ft., as they jibed over and luffed around with 7s. between them.

There was heeling and hiking on Challenger as sheets were hardened; but Dominion, standing much stiffer, began to steam by to windward. The wind was moderate and puffy, as it had been over the first leg. It was evident that while Challenger's crew had to work at times to keep her up, Mr. Crane had her under good control, and could readily heel her or hold her at an effective angle, such as these boats require in order to maintain their highest speed.

Dominion, however, had ideas of her own as to angle of heel, most of the time she stood up quite straight, her crew, even to leeward, being unable to heel her in spite of her narrow beam. At intervals, however, she would of herself lift the weather hull just clear of the water, instantly picking up in speed. At all times she was working out to windward, but her performance was not as even as that of Challenger.

After standing for two minutes on port tack, Challenger came about, Dominion following. Challenger immediately came about again, but this time Dominion refused to follow as she is perceptibly slower in stays, and held on for a little time, when she too came on port tack. They held this tack for some time, Dominion going steadily until she was 250yds. on Challenger's weather bow. Each made a couple of short tacks for the second mark, Dominion making it with a lead of 1m. 26s., a total gain of 1m. 33s. in two miles to windward.

They came down fast under plain sail, with a good breeze on the beam, Dominion making another gain of 25s., so that she ended the round at 1:47:19, with a lead of 1m. 51s.

Dominion jibed smartly at the line, and her balloon jib went up, her crew making better work than on Saturday. Challenger came along in a hot stern chase, and began to overhaul the leader, but at too great a distance to interfere with her. Dominion held in a little toward Pointe Claire on this leg, Challenger steering a straighter course. When they luffed around the mark, at 2:01:45 for Dominion, Challenger had made a gain of 1m. 6s.

The second leg was sailed under the same conditions as on the first round, excepting that the wind was a little stronger, while the sky clouded over with a threat of a squall to windward. Dominion repeated her gain of the first round, making 1m. 24s. on Challenger to the second mark. Each sailed her own course, with no feints or maneuvering, one long leg on port tack and a shorter one for the mark, the wind being not quite up the course.

The last leg of the round showed a loss of 11s. by Challenger, making Dominion's lead at the end of the second round 2m. 20s.

On the free leg Challenger once more made a big gain, 1m. 50s., so that Dominion started to windward with but 30s. lead. She added to this, however, practically all that she had just lost, 1m. 46s. at the second mark. They reached home to be timed, Dominion exactly two hours for the full course of twelve miles, leading Challenger by 2m. 47s., having gained 31s. on the reach. No protest was made over the foul on the first leg.

SECOND RACE.

Preliminary, 12:50:00. Preparatory, 1:00:00. Start, 1:05:00.

	Time.	Elapsed.	Loss.	Lead.
First Round—First Leg.				
Dominion	1 20 27	0 15 27	0 00 07	. .. ..
Challenger	1 20 20	0 15 20	. .. ..	0 00 07

Second Leg.				
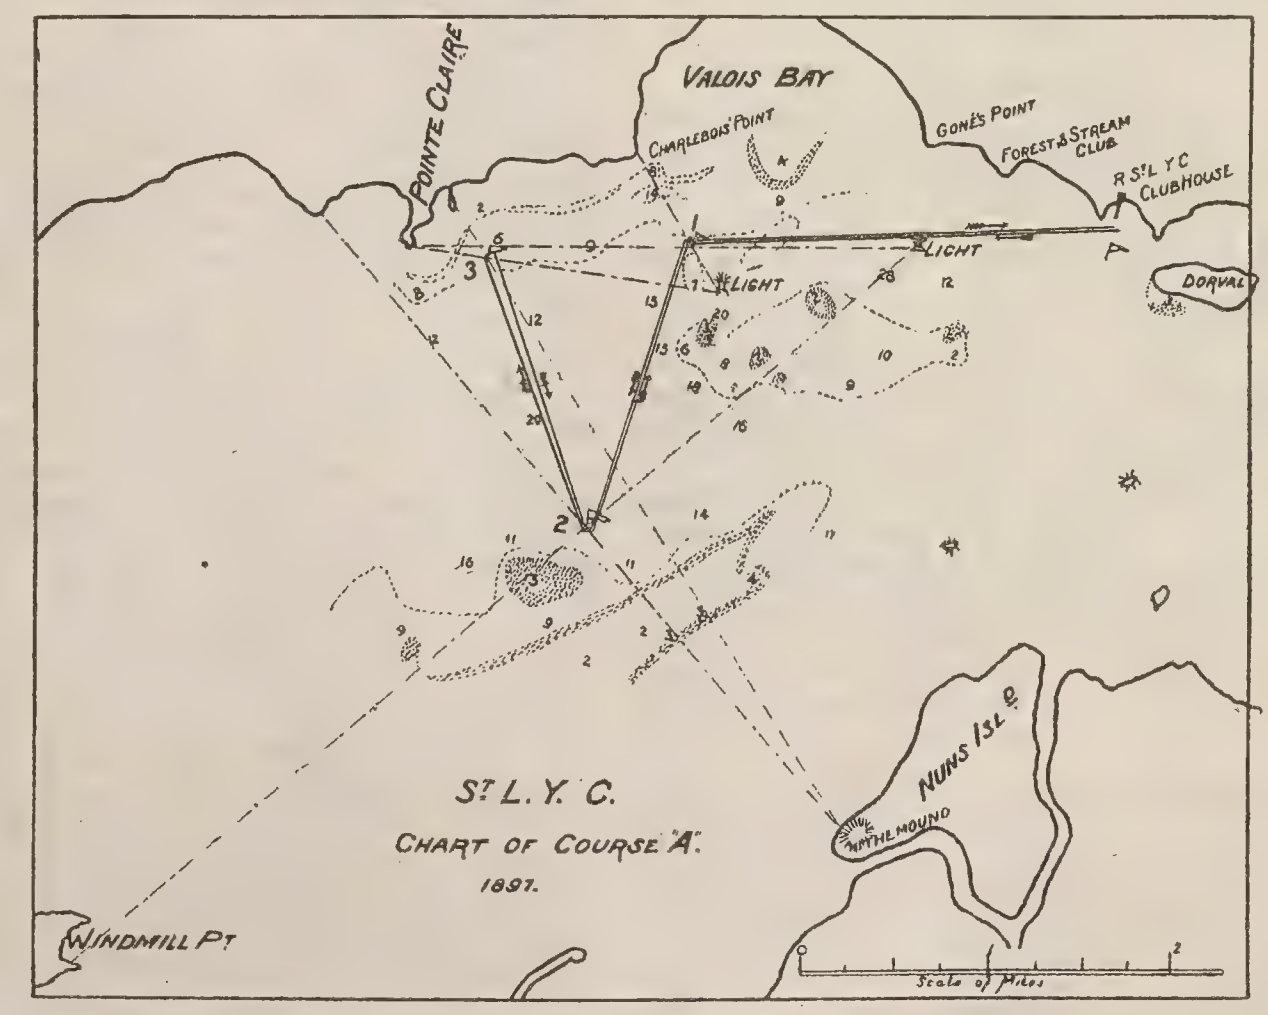
Dominion	2 17 06	0 15 21	. .. ..	0 02 09
Challenger	2 19 15	0 16 45	0 01 24	. .. ..
Third Leg.				
Dominion	2 27 40	0 10 34	. .. ..	0 02 20
Challenger	2 30 00	0 10 45	0 00 11	. .. ..
Third Round—First Leg.				
Dominion	2 40 40	0 13 00	0 01 50	0 00 30
Challenger	2 41 10	0 11 10	. .. ..	. .. ..
Second Leg.				
Dominion	2 55 00	0 14 20	. .. ..	0 02 16
Challenger	2 57 16	0 16 06	0 01 46	. .. ..
Third Leg.				
Dominion	3 05 00	0 10 00	. .. ..	0 02 47
Challenger	3 07 47	0 10 31	0 00 31	. .. ..

After the race both boats were hauled out, as usual, and sails and hulls carefully tended.

Third Race.

Windward and Leeward Course.

Tuesday, Aug. 16.



The wind held strong through the evening, with a threat of rain before midnight, and Tuesday morning was cloudy, with a strong S.W. wind. Thunder was heard at times, and a lively shower passed over the club house at 8 A. M., but it was clear again, though the breeze held strong and the sky was cloudy, at 11 A. M., when the committee steamer Dama, Rear-Com. Stephens, left the club house. Dominion started in tow of Chipmunk, but Challenger preferred the wet sail of four miles, from the club house to the starting line, to the risk of towing in the sea. Challenger sailed with the same crew, but W. A. C. Hamilton took the place he had on Saturday on board Dominion, Mr. Arthur Hamilton following the race on Chipmunk.

The course called for was to windward and leeward. The committee boat reached the start at 11:30, and just at noon Challenger came up under three reefs and a storm jib, sailing very fast. Meanwhile Chipmunk had towed Dominion up to Pointe Claire, inshore, where she set sail and stood across for the line, under the same canvas as Challenger.

With the wind S.W., it was necessary to shift the large float which marked one end of the line further in toward Pointe Claire, so that the two miles to windward would clear the long shoal off Isle Perrot. This took some little time, and it was 12:25 when the preliminary whistle was blown. The second mark was sent out dead to windward from the line, about S.S.W., two miles. Dominion had now but two reefs in her mainsail and a storm jib. There were no canoes nor small sail boats out, but a dozen yachts and as many steam yachts, with the Duchess of York. The Lachine B. C. war canoe was at the line.

The preparatory whistle was given at 12:35, with the start at 12:40. With some three minutes still to go, both yachts stood across on port tack in the direction of Pointe Claire, and when a little over a minute was left Challenger came about on starboard tack for the line, to windward of Dominion. The latter tacked and reached out ahead for a moment, but Challenger came up on her as they neared the line and passed ahead, Dominion being on her weather quarter as they crossed. At this time the wind was much lighter, both boats moving slowly, and going very easily in the sea. On Challenger Mr. Crane sat to leeward of the tiller.

Within a couple of minutes after crossing Challenger shook out her third reef, Dominion shaking out her second reef. Both crews worked smartly, and little way was lost. Challenger at once tacked, and after a minute Dominion followed her. The latter was already well out to windward, and her position steadily improved

CUP COURSES LAID OUT JUST WEST OF LINE 2—3, START NEAR 2.

as they stood along on one long port tack.

The wind soon increased to its old force, but Dominion hardly seemed to feel it as she went out to windward with an easy motion over the seas. There were hard puffs at times, in which Challenger heeled to a hard angle and luffed up. The observatory on the mountain, as it proved, recorded the force of the wind as eighteen miles, the record for the heaviest breeze in last year's races being twenty miles.

At I P. M. Challenger tacked, well inshore off Beaconsfield, Dominion at once coming about for the mark, showing a long lead of open water. One long leg on starboard brought Dominion to the mark, she having to pass on the lee side and tack around, to lead it to starboard. Her time for the two miles was 29m. 30s. Challenger followed 2m. 35s. later.

After rounding they jibed booms to port and set spinakers, Challenger having trouble with hers before it was properly set. The run was made by Dominion in 13m. 49s., she losing 49s. to Challenger, thus having 1m. 37s. to her credit as she luffed over the line on starboard tack to begin the second round. She stood along on starboard until Challenger rounded, tacking at the line, when Dominion also came about, with a long lift out to windward.

As they beat out again the wind was a little lighter, the sun now shining hot overhead. At 1:40 Dominion went on starboard tack for the mark, Challenger tacking a little later. The times showed a further gain of 3m. 49s. for Dominion.

They jibed and set spinakers as before, and ran down; challenger making up just half a minute.

On the last round the wind freshened, and Challenger, to leeward and close under the Pointe Claire and Beaconsfield shore, caught it very hot as puff after puff struck her. She would have been far better off under three reefs instead of two, as there was no hope of her winning save through an accident to Dominion, and she was straining hull and spars to no purpose. The wind, which had varied through the race, was now more to the westward. Dominion turned the last mark with a gain of 4m. 34s., and a lead of 9m. 29s. She set no spinaker, and carried her boom on the starboard side, topping it well up and taking things easily. Challenger's crew raced her as hard as she could be pushed to the finish, carrying a spinaker all the way over the last leg, the wind being lighter than in the first part of this round. Dominion lost 1m. 3s. on the run, but won by 8m. 26s.

THIRD RACE.

	Time.	Elapsed.	Loss.	Lead.
First Round—First Leg.

Fourth Race.

Triangular Course.

Wednesday, Aug. 17.

The wind held fresh through Tuesday night, but fell by sunrise, there being almost a calm on the lake, with heavy clouds in the N.W., ending in a brisk shower at 8 o'clock. Temporary repairs were made to the hull of Challenger, and she bent her cotton mainsail. During the morning in spite of threatening clouds the sky cleared until the sun was shining brightly at noon, with a light west wind and smooth sea. Challenger towed out astern of Vailima, and bent her silk mainsail in place of the cotton one. Dominion came out after Chipmunk.

The signals were given at 12:35, 12:45 and 12:50. The course was triangular, with buoys to starboard, a close reach to first mark, a beam wind to the second, the Pointe Claire buoy, and a run in.

This time Challenger got the start, Dominion being close on her weather quarter, both moving slowly. They crossed on the starboard tack, and trimmed for a close reach, Dominion working out to windward, but Challenger footing decidedly faster. The wind freshened, heeling Challenger to a stiff angle at times, but she seemed to like the conditions, and opened out a good lead on Dominion, being 50yds. ahead when half over the leg. She luffed around the mark with a lead of 1m. 42s.

They reached off under the same sail, with sheets eased, Challenger losing 1m. 2s. The last leg was run with spinakers to starboard before a freshening breeze, now more to the west. When half way over the leg each turned in one reef before the turn to windward. The end of the round showed a gain of 50s. for Challenger, making her lead 1m. 30s.

It was now a beat to the first mark with more wind and a rising sea. Challenger held her own for a time, but Dominion at last began to overhaul her, and there was a hot fight as they neared the mark, Dominion coming up on Challenger's weather quarter and finally on her beam. Challenger was obliged to give room at the mark, which she did, Dominion passing clear ahead with a lead of 6s., having gained 1m. 36s. in the one and one-third miles to windward.

As Dominion turns slowly for a 20-footer, Mr. Crane attempted to shoot inside and through her lee, but as soon as Challenger lost the wind behind Dominion's sails she lost way also, and the current carried her against the buoy. She cleared without damage, but was of course disqualified.

The reach across showed a loss of 58s. for Challenger, and on the run, under spinakers, she was only able to cut this down by 46s., so that Dominion started the third round with 18s. lead.

On the beat out she added 54s. to this, and she also made a gain of 1m. 17s. on the reach across to Pointe Claire. On the last leg each shook out her reef, and Challenger picked up 2s., Dominion leading over the line by 2m. 27s. The full times were:

FOURTH RACE.

Preliminary, 12:35:00. Preparatory, 12:45:00. Start, 12:50:00.

After the Races.

Great preparations were made for an entertainment in honor of the visitors on Wednesday night. A large dancing floor was laid on the club lawn, the house, grounds and pier were piped for acetylene gas and the generating apparatus was set up specially; Chinese lanterns were hung on the pier, a dinner was prepared and the band of the Victoria Rifles was in attendance. A special train from Montreal brought numerous guests, while others drove in from the surrounding country.

By the time that all hands had reached the club house after the finish of the last race, it was noised around that Mr. Crane had received a telegram from the race committee in New York ordering him to refuse all courtesies extended by the R. St. L. Y. C., and to return to New York. With this much truth for a foundation, there went around all sorts of absurd rumors as to the probable action of the Seawanhaka C. Y. C. In obedience to the orders, Mr. Crane and his party did not appear at the club house during the evening. During the evening telegrams of congratulation came in from London and other places. The dance was a success as far as the Montreal and Dorval people were concerned, breaking up at a late hour. The sailing committee had planned to give a dinner on Thursday evening to the members of the Seawanhaka C. Y. C., but a change was made in the programme.

The telegram, as finally published in the daily papers, was from Mr. Kerr, one of the race committee, and Mr. Dresser, a member of the Seawanhaka syndicate, who lately resigned from the committee in consequence of being interested in a competing yacht:

"We wish our representatives to leave there the very first hour practicable after final race, also to preserve a very dignified attitude concerning this event, and not accept public or formal hospitalities. We will address the Royal St. Lawrence Y. C., saying that we will communicate with them regarding this contest as soon as we can gather our scattered committee.

DRESSER AND KERR."

Seawanhaka and Challenger were stripped immediately after the race, on Wednesday; everything was packed, no light matter, considering the amount of spars, gear, sails and sundries in the outfit of the two, and the naphtha launch Gadabout, of the club, towed them down to Lachine and through the lock to the Dominion Bridge Company's wharf. Mr. Duggan met them here and had the boats lifted out by the company's derrick and landed on the bank, whence they were loaded in the afternoon on a canal boat for Ogdensburg.

On Thursday afternoon a challenge was received by the Royal St. Lawrence Y. C. from the Inland Lake Y. A., of which Mr. J. W. Taylor, of Minneapolis, is president, for a race next year.

On Friday a meeting of the sailing committee was held, at which it was decided to recommend to the club that the cup be returned to the Seawanhaka C. Y. C. The reasons for this action, which will be fully stated later, are that it is felt that a material change of the conditions is necessary, and that this can best be made by the club which established the cup; also, as Mr. Duggan will retire from the contest, owing to business and the state of his health, the club has no designer to rely on in the future.

It would be impossible to speak too highly of the hospitality and courtesy extended to the Seawanhaka men and others from the States, both by the club officials, the sailing committee in particular, and by individuals. While the orders to Mr. Crane, to refuse to race and to decline all courtesies, aroused a good deal of feeling on the part of the Canadians, it was not displayed in any way toward Mr. Crane or other of the visitors, and every possible courtesy was shown them up to the moment of their departure. During their stay they had the full privilege of the club house, ways, etc., and every aid that could be given them in handling and shipping their boats, etc.

Catamaran and Double-Hull.

The formal protest of Mr. Gibson, in behalf of the Seawanhaka race committee, sets forth very plainly the view of many, both from the States and Canada; in brief, that Dominion was of a type that is universally barred in yachting by usage and common consent. As to the exact nature of this type a very indefinite idea prevails; in the protest itself the term catamaran is used as synonymous with double-hull. While a catamaran must of necessity be a double-hull craft, it does not necessarily follow that the reverse is the case, and that every double-hull boat is a catamaran. The catamaran is, by a strict dictionary definition, a craft composed of two entirely separate hulls, connected by a deck or more properly a light skeleton framework; the derivation of the word is ascribed to katta, tied, and maram, wood, literally tied trees, indicating its original form, two trunks or logs connected by cross pieces lashed to them. A very common form of modern catamaran is the life raft seen on every passenger steamer, two cylinders of galvanized iron connected by a light framework intended to support several people. It was one of these catamarans which Naval Constructor Hobson used in escaping from the wreck of the Merrimac.

The catamaran is known to yachtsmen mainly through the ingenious sailing machine invented twenty-two years ago by N. G. Herreshoff, two canoe hulls, placed at some distance apart in proportion to their length, and connected by a framework of joints, springs and compensating levers so as to allow each to work independently of the other. Each hull was provided with its own centerboard and rudder, and the connecting framework carried a light oval car for the crew. The one feature of this device which made it successful was the use of the ball and socket joints with springs, as in the numerous previous experiments with rigidly connected hulls the craft had always worked and strained in rough water and had proved very slow. The leading principles of the catamaran are very light displacement, easy lines, and stability obtained by the great breadth of beam, both hulls being equally immersed.

The Type of Dominion.

It must be plain upon even a brief consideration that Dominion is not a catamaran. Her displacement, 1,750lbs., is as great as the other boats in her class, her beam is less; while the opening between the two portions of the hull extends above the normal plane of flotation, she is structurally but a single hull, very rigidly constructed, with not only an unbroken deck covering both hulls and all the space between, but with an unbroken bottom, continuous from hull to hull, and for the entire length, and enclosing, with the deck, a material amount of space. She possesses none of the distinctive characteristics of the catamaran, and at the most she can only be fairly discussed as a double-hulled boat.

There will no doubt be a hunting over of old records of a quarter century ago for precedents as to the status of catamarans in yachting, but at present we have no opportunity for this, nor do we see that it has any proper and legitimate bearing on the discussion. The only question, as we see it, is whether Dominion is a double-hulled boat, and if so, whether the Royal St. Lawrence Y. C. was legally and morally justified in selecting her. In discussing the question with several who have opposed her, it has been conceded by them that a mere hollowing of the bottom, even up to the plane of flotation, so long as this plane is one and unbroken instead of in two separate parts, does not of necessity constitute a double-hulled boat; in other words, that as the rules now stand, a designer may give any amount of concavity, the reverse of deadrise, to the floor of his vessel so long as it is below the water when in measuring trim. As a matter of fact, as already stated, Dominion's middle bottom is from 2½ to 4in. above the water, showing two distinct and separate planes of flotation.

Conceding that Dominion is a double-hulled boat, though in reality she is very much more, we doubt very much whether any precedent can be established, even at a long interval of time, which will prohibit her entry; but in our opinion this is but an immaterial issue. The whole question is one that can only be fairly discussed on its immediate merits, and in connection with the most recent developments of the modern craze for high speed, which promises to kill this class as it has all others.

Exactly two years ago, or in the FOREST AND STREAM of Aug. 22, 1896, in discussing the then novel El Heirie, we pointed out, for the first time in print, the new and distinctive principle of design on which both she and Glencairn I. were produced, of designing but one bilge of the yacht, considered in itself for the time as a complete hull; and of heeling the boat, when under way, so as to sail on this one bilge alone or on its fellow. So far as we are aware, while working in a general way toward this end, Mr. Crane in El Heirie did not follow out exactly this method, but in designing Glencairn I, Mr. Duggan and Mr. Shearwood deliberately disregarded every part of the hull except the immersed waterline at a strong angle of heel, and that portion of the bilge beneath it. The immersed waterline was first plotted, as nearly symmetrical as possible, and considered as the normal L.W.L. plane; the section lines of the bilge, showing an easy spindle form of narrow beam, were then plotted and faired by lines equivalent to bow-buttock lines. After this portion of the boat was completed, the opposite bilge being, of course, a counterpart to it, the middle portion at each end and the top sides were drawn in so as to connect these two bilges, and at the same time to make of the vessel a harmonious whole with a suitable form for sailing at times on an even keel, when she could not well be heeled, as when running; and such as to be readily constructed after the usual methods. The FOREST AND STREAM, in the article alluded to, which we reprint in another column, made all of this perfectly plain within a few weeks after the advent of the two successful embodiments of the principle, El Heirie and Glencairn I.

It was perfectly well understood that these boats evaded the measurement of L.W.L. in a new and effective manner, and placed an entirely new value on L.W.L. as a factor of the Seawanhaka rule. They wiped out at one sweep the existing class of the normal type, and it was generally considered a very smart and perfectly justifiable trick. The fact was perfectly appreciated, not only by designers and experts, but by many who make no claims to a knowledge of the technical points of yachting, that an entirely new principle had been introduced.

From the days of Noah down to the trial races of the Seawanhaka cup, in 1895, a period that covers many advances in naval architecture, it has been the object of designers to produce vessels that would sail with both bilges equally immersed (in theory at least), and with their keels as deeply immersed as possible. Especially has this been the case with all yachts, as instanced by the sandbags piled to windward of old, and the growing weight and depth of lead keels in more recent years. It was on this principle that Sorceress and Spruce, with the first American 15-footers, Ethelwynn, Trilby, Olita and Trust Me, were designed. The winners of the trial

and cup races of the following year were built upon a new and radically different principle, they were deliberately designed to be sailed with but one bilge immersed, the other being high in the air, by means of shifting the crew to leeward if necessary in a light air. As for the keel, it was intended to be just about at the surface of the water.

This innovation, perhaps the most extreme in the history of designing, was accompanied by a very marked increase of speed through the successful evasion of L.W.L. as measured, the practical result being that the bilge became a narrow canoe hull, with a far greater length than the L.W.L. when upright, and the boat was allowed a much larger sail plan than the older boats of less effective length and far greater beam. There was a trick in balancing the boats, but it was far less difficult than sailing a canoe with a long sliding seat, and quickly mastered. This same principle was naturally carried up into the 20ft. class in 1897, where it has been developed to an extreme point by all designers.

The attitude of the FOREST AND STREAM toward all developments in the direction of extreme speed and the specialization of the racing machine is well known, but in this case there was nothing to do but to follow the example of the yacht clubs and yachtsmen, and at least to accept quietly the new departure. As far as the clubs were concerned, no effort was made to condemn or check it, and the freaks which rapidly bred under it were one and all welcomed without a question as to their type or nature. Nearly fifty small craft, of 15 or 20ft. racing length, have been built for the Seawanhaka trial races in the past four seasons, of which number probably two-thirds would justly come under the name of freaks, and yet no attempt has been made to draw a line. We realize well the difficulty of such a task, had it been attempted, and we do not question the wisdom of the policy of the race committee, as indicated by its acts, or lack of positive action, in encouraging the development of the highest possible speed at the evident sacrifice of every other attribute of a yacht. We merely wish to show that, regardless of all conventional ideas and sentimental scruples, designers have been encouraged to try the most extreme experiments, as in Skate, Alanka, In It, Vagary, Akabo, Arauca, Question and numerous others.

The fact has been generally recognized that the highest speed yet attained in either class was in boats sailing on the new principle, of one immersed and one emersed bilge; practically a new variation of the double-hull idea.

The possibilities of a further extreme of development in the line of cutting out the practically useless keel and thus improving the form of each independent bilge have also been understood and discussed, and in fact this is the only conclusion which can logically result from a careful study of the small yachts of the last three years.

The first one to take this final step, as it will probably prove, was Mr. Duggan, in Dominion; and no one who will study the boat as she deserves to be studied will be inclined to deny that he has done the work well, whether it be legitimate or otherwise. In Dominion he has employed the methods of design first used in Sothis and Glencairn I., in carrying out the new principle to its logical and probably final step, as it does not seem that much more can be done in this peculiar line. It is very likely that further experiment will show that this particular boat can be materially improved in detail to make the finest racing machine yet known to yachting; but as far as principles of design are concerned, the end has probably been reached.

We have not yet heard from any who have condemned her a word to indicate that they appreciate the vital points of her design. The leading principle, of sailing on one bilge at a time, as in Momo, Seawanhaka and Challenger, has been more thoroughly and scientifically worked up in Dominion than in any other boat of the type, but this is not all. It has long been the dream of yachtsmen to produce a variety of double-hull boat in which a large hull is superimposed on a smaller one, the latter immersed, and the former just clear of the water when in measuring trim, but so immersing itself when under way as to utilize the unmeasured length. Boats of this type have been built for the Seawanhaka trial races and have sailed in them, but have been unsuccessful for perfectly obvious reasons, their transverse sections being of the old form, more or less of the V. It has proved impossible to immerse any effective length by heeling, as there is a certain amount of displacement to be disposed of in some way. In Dominion Mr. Duggan has solved, we believe for the first time, this old problem; and in a practical and effective way. The displacement of the two hulls is sufficient to float easily on a L.W.L. of 17ft. 6in. topsides of great overhang, about 9ft. at each end. These overhangs form practically a long canoe superimposed on one of half the length. As soon as the weather hull lifts clear of the water, the position in which the yacht does her best work, its 700lbs. of displacement is immediately transferred to the lee hull, which is immersed for practically its whole length. The curve of areas for the upright position, or the two hulls, and the inclined position, with one hull just clear of the water, shows more plainly than anything else the ratio of length to midship section, and the enormous gain in fineness of form.

This point alone separates Dominion from the catamaran. The former does her best work with but one hull immersed, the other being barely clear of the water, but not enough to catch the wind under it. A catamaran, of either the ordinary raft construction or the Herreshoff articulated construction, is intended to sail with both hulls equally immersed, and with her limited displacement and great beam will probably pitchpole when one hull is lifted clear of the water and all the buoyancy of the other called into play.

The popular view of the case, that Dominion is a catamaran and that catamarans are barred from competition with yachts of the normal type, either by usage or definite legislation, is a perfectly natural one, and there is nothing strange in that it has been accepted on sight as positively conclusive by many, even among yachtsmen. The only remarkable point is that experts, men who have been intimately associated with the development of the modern freak racing machine, as designers, critics and in the management of matches and races, should accept off-hand such a narrow and superficial view. All who have been in any way associated with the 15 and 20ft. classes since 1895 have been compelled to study closely a peculiar course of freak development which has run to all possible extremes of form. The one point of this wide and often wild experimenting that has produced good results in the line of speed is the use of but one bilge at a time, as in all the Crane and Duggan boats. Anyone who looks at Seawanhaka or Speculator to-day will see the bilge carried forward until it forms a positive shoulder or hump at the bow, the idea being to gain length when heeled by the immersion of this hump. Every student of these boats has had to discard all conventional ideas of fair form in an approximately upright position, and to accustom himself to a model that looks like a tub when upright, but that shows very fine and easy lines when considered as heeled until her keel is just clear of the water.

So far as sentiment is concerned, a man who had spent the last three years at the North Pole might be justified in condemning Dominion as a freak that was barred by usage from the companionship of legitimate yachts; but with a man who has watched in succession Question, Hope, El Heirie, In It, Glencairn I., Skate, Arauca, Vagary, Monantiquot, Alanka, Akabo and Gold Bug, with their fellows, the case is entirely different.

As to the actual merits of the two boats, Challenger and Dominion, both confessedly racing freaks and nothing else, and the former accepted as perfectly legitimate by the yachting community, it must be admitted that they are designed upon precisely the same principle, worked out by similar methods; of the two, Dominion, as far as tested, is fully as seaworthy and safe in model, more comfortable as a sailing machine, very much more durable in construction, being apparently good for a long period of future use, while Challenger is already a wreck.

So far as the development of extreme speed goes, apparently the sole end of modern yacht racing, Dominion marks as great an advance as El Heirie and Glencairn I., as yet she is but the first experiment, and there is little doubt that she is as capable of improvement as these two were in producing Momo and Glencairn II. So far as the advancement of naval architecture is concerned, she must go in with the rest of the class, as part of a comparatively useless experiment in the evasion of measured waterline, establishing no principles of material value.

It is foolish at this late day to represent Challenger as a normal and legitimate yacht, and Dominion as a freak that is properly barred by sentiment, if nothing else. If any line is to be drawn, and thus far the clubs have declined to do it, it must be between the old type of yacht, with both bilges and keel immersed, and the new type, with one bilge and the keel in the air. This line once passed, all sentimental considerations and conscientious scruples disappear, and it will be a very difficult matter now to draw a just line of limitation between the fair and the unfair freak.

The present question resolves itself to this: by common consent and usage of both parties, designers have been encouraged in disregarding all previously existing considerations, and seeking for the highest possible speed in any form of hull. No attempt whatever has been made to pass judgment upon freaks of the most extreme type, but such have been admitted without question to the trial races of both clubs. One particular feature of design has received the open approval of all parties, and its development to a greater extreme each year has been relied on by each for success. In this competition Mr. Duggan has again proved victorious, producing a new combination of principles which promise a material increase of speed in racing machines. The one question to be decided is whether, in doing this under existing conditions, and not under such conditions as existed a quarter of a century ago, he has passed the indefinite line between sportsmanlike and unsportsmanlike conduct.

The Single-Bilge Principle in Designing.

From the FOREST AND STREAM, *Aug.* 22, 1896.

IN the normal type of vessel, Ethelwynn, Gloriana, Volunteer, Minerva, America, all more or less of the V type of section, the load waterline as measured at rest in smooth water represents a great length for the size of the yacht; this is so even in the modern Herreshoff type with an excessive area of load water plane. When one of these vessels is heeled to the average sailing angle, the waterline actually shortens forward, though gaining some aft by the long full counter. The middle waterline, the distance measured in practically all measurement rules, is very long in comparison with the area of load waterline plane, and also with the longitudinal element of that plane at the quarter beam of the vessel or along the middle buttock line.

In El Heirie, and to a still greater extent in Glencairn, the measured waterline is reduced to a minimum as compared with the size of the yacht and the area of the L.W.L. plane by the cutting away of the rib or V represented by the stem and keel of an ordinary vessel, and the adoption of the flat scow bottom carried right up the stemhead. That such a form necessitates a waterline that is but an ellipse, with other lines that no designer would accept as capable of high speed, is a fact that must be discussed later; the main point is that this peculiar variation of the scow form permits such a successful evasion of waterline length as has never been achieved before.

In all yachts of the normal type the designer works on the assumption that the hull is to be sailed as nearly upright as possible, that the true L.W.L. plane of the yacht when under way in a race should coincide as closely as possible with the L.W.L. plane of the design. In the scow type, including El Heirie and Glencairn, a very different principle is involved. It is never expected or desired that the yacht when under sail shall have the same lines indicated by a model, but the designer starts out in a very different manner. While the design is made, as a matter of conventionality and convenience, in the ordinary upright position, the designer assumes from the start that the yacht is to do her best work to windward and reaching in a very different position, heeled intentionally to a good angle, and with an immersed form that bears no relation whatever to the form when at anchor. In the case of El Heirie the effective sailing angle is probably somewhere with deck just awash and center of keel about at the surface of the water. In this position there is still displacement enough in the hard, round bilge; the immersed portion of the hull becomes of the canoe form, with a beam of but 3ft. and a depth of but 7in.; and, what is still more important, the length on the new waterline is as great or even greater than that upon the measured waterline.

Long, narrow, shoal and of very easy form, this portion of the hull has all the speed elements of the canoe; but like the canoe, it lacks power. This, however, is supplied, just as in the canoe, by mechanical means entirely outside of the natural stability of the hull itself. The weather bilge and deck are both out of water and serve a double purpose, first, through their own weight acting as the weather hull of a catamaran to windward, and secondly, again as in the catamaran, as a seat for the crew far out to windward.

It may be said that there is nothing new in all this, that it is as true of the common scow as of El Heirie; but the scow has found many friends and exponents in the past, who have proclaimed its advantages; at the same time we have yet to hear of one who has pointed out this peculiar advantage in the way of successfully evading the measurement of waterline, or who has employed it in a way which indicated any comprehension of it. In both El Heirie and Glencairn this same idea, derived independently and at different times, has been elaborated in a thoroughly careful and scientific manner, which shows that the designers were not, as is so often the case, misled by the color and texture of the husk, but have faithfully sought the truth in the kernel. Compared with these two yachts the more primitive scow models have been far from successful, mainly in lack of light weather speed, there being no trouble about speed in a strong breeze.

The experiment of 1891, in cutting off the fore end of the waterline of Gloriana, was a most radical one, but it really involved no new principle, dealing merely with the reduction of deadwood, which, as it proved, was useless, though it had always been considered essential. The experiment of 1896, in El Heirie, in cutting away with one bold stroke what Mr. Herreshoff had left in Gloriana, is still more radical and goes beyond a mere detail in amounting to a clear and well defined principle heretofore unknown in designing. Just how far upward in the list of classes this principle may be employed is as yet doubtful; probably the 25ft. class will mark the extreme limit. It can only be employed where the crew constitutes a large portion or in fact all of the ballast, and in craft so small that the risk of capsize amounts to nothing and they may in racing be heeled to a dangerous angle. It is in no way probable that El Heirie's model would succeed in a yacht of 30 to 40ft. l.w.l., which must of necessity be sailed as nearly upright as possible, and even in the 25ft. class the allowance of crew, five in all, is probably too small to make such an experiment successful. Whatever class be selected for the contest of 1897 for the Seawanhaka cup, there can be no question that this new type of yacht will play an important part, and much more in regard to its capabilities may be looked for.

[In view of the recent articles on the proa, the word proa would be more correct than catamaran, as used above.—Editor.]

Trap-Shooting.

Fixtures.

Aug. 23.—Lyndhurst, N. J.—Live-bird handicap, 25 birds, $10. T. W. Morfey, Sec'y.

Aug. 24.—Warwick, N. Y.—Special shoot, Hudson River Trap-Shooters' League, on grounds of Warwick Gun Club. J. B. Rogers, Manager.

Aug. 24-25.—Minneapolis, Minn.—Tournament of the Minneapolis Gun Club. G. J. McGraw, Sec'y.

Aug. 25.—Bristol, Conn.—Fourth annual tournament of the Connecticut State League. H. J. Mills, Pres.

Aug. 25-26.—Mt. Kisco, N. Y.—Tenth annual target tournament of the Mount Kisco Rod and Gun Club. F. E. Wood, Sec'y.

Aug. 27.—Hingham, Mass.—Hingham Gun Club's one-day tournament.

Aug. 27.—Philadelphia.—Philadelphia Trap-Shooters' League, on grounds of Silver Lake Gun Club, Point House Road. J. O. Schutz, Sec'y.

Aug. 27.—Hackensack, N. J.—Regular monthly cup shoot of the Bergen County Gun Club. C. O. Gardner, Sec'y.

Aug. 29-31.—Union City, Oklahoma.—Union City Gun Club's tournament. F. M. Johnson, Sec'y.

Sept. 3.—Natick, Mass.—Amateur shoot of the Natick Gun Club. On Sept. 5 if stormy. S. Bowker, Manager.

Sept. 5.—Worcester, Mass.—Worcester Sportsman's Club Labor Day shoot; open to all. A. W. Walls, Sec'y.

Sept. 5.—Corning, N. Y.—First Labor Day shooting tournament Rain Makers' Gun Club; targets. Harry J. Sternberg, Sec'y.

Sept. 5.—Newark, N. J.—Forester Gun Club's Labor Day merchandise shoot. John Fleming, Captain.

Sept. 5.—Pawling, N. Y.—All-day shoot of the Pawling Gun Club; targets. Morton Haynes, Sec'y.

Sept. 5.—Woodlawn, L. I.—Labor Day shoot of the New Utrecht Gun Club. E. C. Frost, Sec'y.

Sept. 5.—Schenectady, N. Y.—All-day shoot of the Schenectady Gun Club.

Sept. 5.—Meriden, Conn.—Fourth annual Labor Day tournament of the Parker Gun Club. C. S. Howard, Sec'y.

Sept. 5-6.—Reading, Pa.—Mt. Penn Gun Club's merchandise and intercounty trophy shoot; targets.

Sept. 5-6.—Rock Island, Ill.—Rock Island Gun Club's amateur tournament.

Sept. 6-9.—Kansas City, Mo.—Schmelzer Arms Co.'s fifth annual tournament; targets and live birds.

Sept. 7-8.—Kingston, N. Y.—Tournament of Hudson River League, on grounds of Kingston Gun Club.

Sept. 7-8.—Haverhill, Mass.—Tournament of the Interstate Association, under the auspices of the Haverhill Gun Club. Geo. F. Stevens, Sec'y.

Sept. 7-8.—Sidell, Ill.—Sidell Gun Club's tournament; targets only. H. J. Sconce, Manager.

Sept. 7-8.—Cherokee, Ia.—Second annual tournament of the Cherokee Gun Club. Irving Weart, Sec'y.

Sept. 7-9.—Aledo, Ill.—Aledo Gun Club's amateur tournament.

Sept. 9.—Wellington, Mass.—All-day shoot on grounds of Boston Shooting Association. O. R. Dickey, Manager.

Sept. 13-16.—Detroit, Mich.—Tournament of Michigan Trap-Shooters' League. W. H. Brady, Sec'y.

Sept. 21-22.—Cleveland, O.—Cleveland Gun Club's eighteenth annual tournament. J. R. Donnelly, Sec'y.

Oct. 4-6.—Newburgh, N. Y.—West Newburgh Gun and Rifle Association's fall tournament.

Oct. 12-13.—Greensburgh, Ind.—Greensburgh Gun Club's tournament. W. Woodfill, Sec'y.

Oct. 18-20.—Nashville, Tenn.—At Belle Meade Stock Farm; two days targets; two live birds; $500 added. W. R. Elliston, Manager.

Oct. 18-21.—Belle Meade Stock Farm, near Nashville, Tenn.—Two days at targets; two days at live birds; $500 added.

1899.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication n hese columns, also any news notes they may care to have printed. Tiee in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The E. C. cup, emblematic of the target championship of the United States, has had a peculiar career, since but two men—Messrs. Heikes and Gilbert—seem to have had the necessary confidence in their own skill to contest for it; and indeed the conditions—50 targets at unknown angles, 50 expert, and 25 pairs—are devised to make the contest one of the highest skill and the most finished proficiency on the part of the contestants. Gilbert was first to win it in the open competition, at Guttenburg, in The E. C. Powder Co.'s tournament, in May, 1896. On Aug. 20 of that year Heikes contested for it with Gilbert, and won it at Watson's Park, Chicago, with scores as follows: 48 to 47 at unknown angles; 45 to 44, expert rules; and 40 to 39 on doubles—133 to 130—just one target on each of the different styles of shooting. At Dayton, O., on July 31 of last year, Gilbert won by a total of 142 to 136, making 48 at unknown angles, 48 at expert, and 46 at doubles; while Heikes made 47 at unknown angles, 44 at expert, and 45 at doubles. Their last—the fourth—contest for it at Watson's shows no falling off in the ability of these wonderful experts, and their powers are so near alike that they seem to be in a class by themselves. Each now has won it twice, and no others have applied, which in a way is a testimonial to their prowess.

The monthly team match and tournament of the Philadelphia Trap-Shooters' League takes place Aug. 27, on the grounds of the Silver Lake Gun Club, Point House Road and Pennsylvania R. R. Coaches run from Second and Mifflin streets 9:45, 10:30, 11:30, 12:30, 1:15, 1:45 and 2:30. Sweepstake shooting commences at 10:30. The team match commences at 1 o'clock. Two sets of expert traps will be used. There are twenty events on the programme, of which sixteen are 10-target events and four 15-target events, two of which are 75 cents entrance, and two at 50 cents, the latter having each $3 added money. Each event excepting the two mentioned above has 50 cents entrance. This should be a tournament after the amateur's own heart, for if there is any programme in which the amateur can revel it is one made up of 10-target events. Targets 1½ cents. Purses will be divided under the percentage system, excepting events Nos. 13 and 16 and the team race, which will be governed by the Rose system. All sweeps optional.

The programme for the all-day shoot on the grounds of the Boston Shooting Association, Wellington, Mass, Sept. 9, can now be obtained of Mr. O. R. Dickey, the manager. Shooting commences at 10 o'clock. Shells sent care of Pinder's Express, 20 Broad street, Boston, will be delivered at the club house. There are seven events on the programme, four at 15 targets, of which three have $1.30 entrance respectively, and one at 80 cents. Two are at 20 targets, each $1.40 entrance. The fifth is at 100 targets, entrance $5. This event will be shot in four 25-target events, with extra sweeps of $1.50 each. The four highest guns shooting through the programme will receive $25, divided 40, 30, 20 and 10 per cent. The tournament is open to all. Targets 2 cents. Sweepstakes optional.

This week and next will be very active ones in shooting circles. Tuesday of this week, at Lyndhurst, N. J., the 25 live-bird handicap is fixed to take place. Wednesday is fixed for the special shoot of the Hudson River Trap-Shooters' League, at Warwick. Wednesday and Thursday are the dates fixed for the tournament ot the Minneapolis Gun Club. Thursday is fixed for the annual tournament of the Connecticut State League, Bristol, Conn. Thursday and Friday are fixed for the tenth annual tournament of the Mt. Kisco Rod and Gun Club, and Saturday the Hingham Gun Club, the Philadelphia Trap-Shooters' League, the Bergen County Gun Club and the Heikes-Gilbert match for the cast-iron medal have selected for their contests.

On Saturday of this week, beginning at 10 o'clock, at Elkwood Park, Long Branch, N. J., the Grand National Handicap, 50 live birds, $50 entrance, 25 to 33yds. handicap, 30yds. boundary, will be shot. Two events were fixed for Wednesday of this week, the West End handicap, 20 birds, $20, 25 to 30yds., bird allowance handicap, and the Red Top prize, 5 birds, $5, all stand at 30yds. Aug. 31 is fixed for the Dewey handicap, 26 to 31yds., 15 birds, $15 entrance. Shooting commences at 1 o'clock. Sept. 3 is fixed for the Country Club cup, 20 birds, $20, 25 to 30yds., cup and 40 per cent. to winner. Shooting begins at 11:30.

Mr. J. A. R. Elliott made a short stay in New York on Monday of this week, leaving for home on that day on account of the serious illness of his wife. He mentioned that he would challenge Heikes for the E. C. cup in the near future, and determine whether a Winchester gun and shells, Hazard Blue Ribbon would break in on the duet and enlarge the trophy's horizon. On reference to a note in this column, it will be observed that the cup in question has never been won by any one other than Heikes and Gilbert.

On Aug. 27 the Bergen County Gun Club, Hackensack, N. J., will hold its regular monthly shoot. The special event is the 25-target handicap for a handsome cup, which becomes the personal property of the winner; entrance $1. Shooting commences at 2 o'clock. There will be sweepstake shooting in addition to the cup event. N. Y., S. & W. R. R. trains leave New York, Pennsylvania R. R. Ferry, at 12 M., 1:10, 2:20 and 3:30 P. M. All are welcome. C. O. Gardner, Sec'y.

Mr. Geo. F. Stevens, secretary-treasurer of the Haverhill Gun Club, Haverhill, Mass., writes us as follows: "At a meeting of the Haverhill Gun Club, held Aug. 15, it was voted to offer a diamond stud, to cost not less than $50, as a prize for the shooter making the highest average at the tournament of the Interstate Association, to be held in this city Sept. 7-8, under the auspices of this club. Any one is eligible for this prize who shoots through the entire programme on both days."

In the contest for the Montgomery Ward & Co. handicap diamond badge at live pigeons, Mr. C. Comly won in a field of thirty-five contestants, at Watson's Park, Chicago, on Wednesday, Aug. 17.

The programme of the Mount Penn Gun Club's forthcoming merchandise shoot will be found in our correspondence under the head of "Trap about Reading," this week.

ON LONG ISLAND.

EMERALD GUN CLUB.

Brooklyn, L. I., Aug. 16.—The scores made to-day are given herewith. The event was at 10 live-birds. Mr. G. E. Greiff was referee. Dr. Hudson was scorer:

E O Weiss	2212212221—10	C Stuezle	2101021112— 8

NEW UTRECHT GUN CLUB.

Woodlawn, Aug. 20.—The club shoot of the New Utrecht Gun Club brought together about a dozen shooters, who spent a most agreeable afternoon in friendly competition. The grounds are level, well fenced, and equipped with a set of traps for live-bird and target shooting respectively, and a commodious and substantially built club house furnishes ample accommodations for the visitors.

Dudley was shooting in great form, scoring 49 out of 50 at one time, and shooting with great coolness and accuracy. Banks was not feeling first rate, and his score showed some falling off in consequence. Platt Adams was not quite accustomed to his new way of holding his gun, so that his scores were not all up to his real capabilities, but as he did not fudge to any important degree he feels a decided gain in his shooting, and a promise for good scores in the future.

No. 4 was the club shoot; No. 5 was the Troisdorf cup event.

There were several team races shot, the scores in the regular events counting on the team competition, the first event being in the club shoot. No. 10 was a 15-target sweepstake race, in which low man paid for the targets.

Club shoot:

Trap Around Reading.

READING, Pa., Aug. 13.—The South End Gun Club held a practice shoot at targets this afternoon at their shooting grounds, some good scores being made. The club has decided to enter two five-men teams in the trophy shoot for the intercounty championship, to be decided at the Mt. Penn Gun Club's shoot on Sept. 5-6, to be held on Mt. Penn, this city. The club has some very fine shots as members, and it has been decided to try and win the team championship, as the South End boys have for the past three years won this title. It was also decided to hold practice shoots every Saturday until the trophy shoot, and the men making the best scores to be selected. The scores of to-day's events follow:

Events:	1	2	3	4	5	6	7	8
Targets:	10	10	10	10	10	10	15	5p
Gerhart	10	8	7	7	5	8	9	3

H Saylor	4	5	..	..	..	..	..	..

Reading, Pa., Aug. 10.—The Mount Penn Gun Club held a meeting last evening and a report was read from the committee in charge of the coming merchandise shoot, Sept. 5-6, stating that acceptances from Harrisburg Gun Club, Keystone Gun Club, of Philadelphia; Shuler, of Pottstown, and Mahanoy City Gun Club, had been received, and also felt assured of entries from at least twenty-two other clubs.

Chambersburg, Pa., Aug. 8.—The first of a series of three contests between Keystone Gun Club, of Lebanon, Pa., and Chambersburg Gun Club was held to-day on the grounds of the latter club. The shoot is a friendly one, and is not for either stake money or trophy. Lebanon won the live-bird shoot, while the home club excelled in target work. In the live-bird contest the Chambersburg boys had hard luck in having so many birds dead out of bounds. The second shoot will be held at Lebanon early in September, and the final shoot will be held at Harrisburg several weeks later. The Chambersburg Club is but in its infancy, and has been organized not quite eight months, and the majority of its members are just beginners.

First event, 25 targets per man, teams of nine men each:

Chambersburg—Capt. Runk 18, Elder 22, Rinehart 23, Rhoades 21, Disney 15, Vanderau 20, Kennedy 14, McGowan 14, Buchanan 19—166.

Keystone, of Lebanon—Tafford 21, Shumaker 15, Smith 20, Zellers 12, Witters 18, Rapp 19, Bates 18, Langdon 14, Ayers 6—143.

The live-bird match resulted in Keystone Gun Club's favor by 7 birds:

Keystone Gun Club.		Chambersburg.	
Smith	0021211111— 8	Runk	1111211*1*— 8

Leesport, Pa., Aug. 12.—The young men of town who have recently organized the Climax Gun Club held their first shoot on their grounds, which they have called Spook Hollow. To-day's match was at 25 targets per man, and some fine scores were made. Bluerock targets were used, and were thrown by the two new traps recently purchased by the Climax Club. The scores follow: Elmore Savage 14, Chas. Tobias 12, Wm. Fix 20, O. L. Lesher 17, O. F. Kauffman, of Reading, shot at 5 targets, hitting 3. The club will meet on Aug. 15 to elect permanent officers, and also to decide upon a plan for their proposed new club house on the Spook Hollow grounds.

West Chester, Pa., Aug. 11.—The West Chester Gun Club and the Shuler Shooting Club, of Pottstown, met here to-day in the second of a series of three matches, Pottstown having won the first shoot at that place, Aug. 4. The contest was an interesting one and attracted considerable attention. The final shoot will be decided at some neutral grounds, the date to be decided upon by the two captains. Sweeps followed the team race, and the West Chester Club's monthly medal shoot, which was won by Foulke, who hit 24 out of 25.

Team shoot, twelve men each, 25 targets each man:

West Chester—Capt. Jackson 14, Foulke 24, Ford 20, Lumis 16, Twaddell 20, Brinton 16, Devoe 18, Ferguson 19, Davis 18, Sellers 13, Gill 16, Henry 18—212.

Shuler, of Pottstown—Sheeler 23, Trumbauer 20, Miller 19, Capt. Wickersham 19, Saylor 16, L. H. Davis 15, Shaner 16, Wein 19, Smith 12, Urner 20, Lenhart 12, Slonaker 18—209.

West Chester Gun Club's monthly medal shoot: Twaddell 20, Brinton 16, Devoe 18, Davis 18, Ferguson 19, Sellers 13, Gill 16, Jackson 18, Ford 20, Foulke 24, Lumis 16, Henry 18.

Sweepstake shooting followed, all at 10 targets, 50 cents entrance:

Blandon, Pa., Aug. 9.—A live-bird tournament was held at the Grand Central Hotel, Blandon, to-day. The tournament was under the auspices of the Blandon Gun Club and was well attended. The birds were a lively lot, all good flyers, and when once the trap was sprung were up and off. The scores follow:

First event, 10 live birds, $7.50 entrance: Wm. Becker, Jr., 9, O. H. Hennershitz 5, Weisner 6, Van Buskirk 6, E. M. Becker 7, Wm. Becker, Sr., 8, Hossler 8, Simpson Becker 10, Bossler 8.

Second event, 6 live birds, $4 entrance: Wm. Becker, Jr., 5, Weisner 2, Ed M. Becker 5, Wm. Becker, Sr., 6, Hossler 3, S. Becker 2, Bossler 6, I. Hoch 6, J. Rothermel 4, B. Kline 5.

Pottstown, Pa., Aug. 13.—The Shuler Shooting Club held a practice shoot at targets to-day, some very good scores being made. The third and final shoot of the Phoenix-Shuler series will be shot here Aug. 20. The Shuler Club also intend entering two teams of five men each in the intercounty championship trophy shoot Sept. 5-6 at Reading, under the auspices of the Mount Penn Club. The scores of to-day's shoot follow:

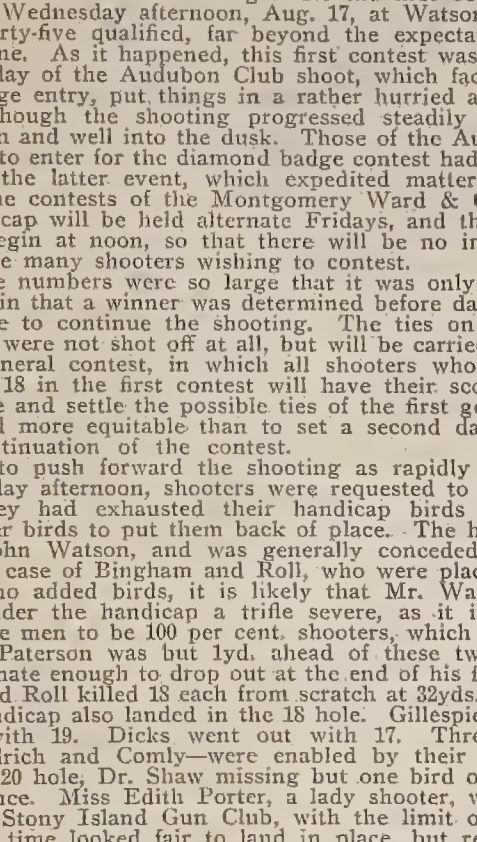
The Martinsburgh Shooting Association, Martinsburgh, W. Va., holds a two days' shoot on Wednesday and Thursday of this week.

WESTERN TRAPS.



MONTGOMERY WARD & CO. HANDICAP DIAMOND BADGE.

CHICAGO, Ill., Aug. 20.—As predicted earlier, Montgomery Ward & Co.'s handicap diamond badge sprang into an instant popularity among the shooters of Chicago. At the first contest of the series, held Wednesday afternoon, Aug. 17, at Watson's Park, an entry of thirty-five qualified, far beyond the expectations of the most sanguine. As it happened, this first contest was unwittingly set for the day of the Audubon Club shoot, which fact, combined with the large entry, put things in a rather hurried and confused condition, though the shooting progressed steadily all through the afternoon and well into the dusk. Those of the Audubon Club who wished to enter for the diamond badge contest had their scores counted in the latter event, which expedited matters somewhat. Hereafter the contests of the Montgomery Ward & Co. diamond badge handicap will be held alternate Fridays, and the shoot will be set to begin at noon, so that there will be no inconvenience to any of the many shooters wishing to contest.

To-day the numbers were so large that it was only by the narrowest margin that a winner was determined before darkness made it impossible to continue the shooting. The ties on second and third places were not shot off at all, but will be carried forward to the next general contest, in which all shooters who could have made 19 or 18 in the first contest will have their scores counted to determine and settle the possible ties of the first general event. This seemed more equitable than to set a second day this week for the continuation of the contest.

In order to push forward the shooting as rapidly as possible, on Wednesday afternoon, shooters were requested to drop out as soon as they had exhausted their handicap birds and missed enough other birds to put them back of place. The handicap was made by John Watson, and was generally conceded to be well set. In the case of Bingham and Roll, who were placed at 32yds. and given no added birds, it is likely that Mr. Watson himself would consider the handicap a trifle severe, as it is practically placing these men to be 100 per cent. shooters, which no man can really be. Paterson was but 1yd. ahead of these two men, and was unfortunate enough to drop out at the end of his first 10 birds. Bingham and Roll killed 18 each from scratch at 32yds. Sturtevant with his handicap also landed in the 18 hole. Gillespie and Bissell went out with 19. Dicks went out with 17. Three men—Dr. Shaw, Goodrich and Comly—were enabled by their handicap to land in the 20 hole, Dr. Shaw missing but one bird out of his 21, with allowance. Miss Edith Porter, a lady shooter, who is secretary of the Stony Island Gun Club, with the limit of the handicap, at one time looked fair to land in place, but retired at the second bird of her handicap string. Dwyer hung on for a long time, but did not get up to the 20th round. Lem Willard was dangerous until his 16th bird. Levi, with a liberal allowance, fell out of the running at his 3d handicap bird. Lockie held on to his 20th bird, but was then out of place.

Great interest attended the shooting of the men whose handicaps carried them well along, and for a long time it seemed anybody's place in the 20 hole. Foss was asked to retire at his 20th bird, and Col. Felton lasted no longer. Mr. Leffingwell, who has been

shooting a great gait recently, went to the bench at his 4th bird. Palmer did not appear for the tie on 20, into which he shot himself by his Audubon Club score, and Dicks also left the grounds.

The birds were throughout the afternoon a smart lot, especially when the sun broke out warm and clear. Toward dusk, however, they naturally went slower and slower, so that the finish for the badge was longer in decision than it otherwise would have been. In spite of this the tie shoot was most exciting, and was watched intently by all present.

Of the three men who stepped to the score to decide the tie on 20 for the badge, it was hard to pick a winner. They were handicapped anew for the tie shooting. Dr. Shaw was placed at 30yds. and given no extra birds. He had shot a slashing gait, and many considered he would win out. Goodrich had also been shooting in great form and had his adherents. He was placed at 28yds. and given 1 bird added to the 10 tie birds. Comly was placed the same as Goodrich. In the latter shooter the knowing ones had already found the winner of the badge. Never has there been seen on these grounds any cooler or neater shooting than that done by Mr. Comly on Wednesday. He seemed absolutely indifferent and unperturbed. He shot Hod Foss' old duck gun, a 9½lb. 12-gauge hammer gun, made by Abbey, and a famous gun here in its time. In this he used a heavy load of Du Pont, with No. 7 shot. At times he seemed very slow with his second, as though he knew he could kill them anywhere, and did not care to pull until he was exactly where he wanted to be. He dropped two or three birds fully 55yds., and one I should think at 60yds. There was no denying Comly on that day. Dr. Shaw stepped back after missing his 6th bird in the tie. Goodrich also missed his 6th bird, and so exhausted his handicap to score 10 in the tie. Comly killed 10 straight, and they decided to continue at 5 birds more, though it was now getting so dark that both men complained that they could hardly see the birds at all. Yet the result proved that the conditions were not impractical, for though Goodrich missed his 1st tie bird in his second string, Comly killed his 5 straight, one of them fully 55yds. away. He was greeted with much applause as the first winner of this beautiful badge.

One can see only success for this new medal competition for our shooters. It is not an individual challenge trophy, but requires eight shooters to make a contest. It is possible that the medal may be in the hands of six or eight shooters before the end of the series, and it is quite likely that sixty or seventy different shooters will compete for it in all. The medal is offered under sportsmanlike conditions, and with none of those strings which excite contempt for trophies in this age of the world in sportsmanship.

The following are the conditions of the competition for this trophy:

1. There will be twelve contests, the first of which will be held on Wednesday, Aug. 17, 1898, at 2 P. M.
2. All contests thereafter will be held on the first and third Fridays of each month, at 2 P. M.
3. All contests will take place at the grounds of John Watson, Burnside, Cook county, Ill., and the said John Watson shall act in the capacity of referee and handicapper.
4. All contests will be at live pigeons at handicapped distances of from 26 to 32yds., the scratch men to shoot at 20 birds and the others to shoot at from 20 to 26, and at the distances the handicapper determines.
5. The successful contestant is to receive the diamond badge and retain the same in his possession until it is won from him at a regular shoot.
6. The one winning the badge the greatest number of times in twelve contests shall retain the same permanently.
7. All ties for the badge will be shot off the same day and immediately after the badge contest, and each contestant shall shoot at 10 birds, subject to an equitable allowance of birds and distance as given the participants in the main event.
8. The contestant having the second highest score in each contest will receive $4 in cash.
9. The contestant having the third highest score in each contest will receive 100 of our best hand-loaded shells, loaded in green cases with any kind of powder he may elect, the same valued at $3. Any contestant purposely dropping for place shall be barred from that and future competitions.
10. Those tieing for second prize shall shoot off the ties at 5 birds, otherwise subject to the conditions named in paragraph 7.
11. Those tieing for third prize shall shoot off the ties at 3 birds, otherwise subject to the conditions named in paragraph 7.
12. No contest will take place unless there are at least eight participants. Should there be less than eight participants then and in that case the contest must be postponed until the next regular time for shooting.
13. These contests for prizes are open to residents of Cook county, Ill., only, but every sportsman is welcome to come as a guest and participate in any or all of the events.
14. No entrance fee will be charged in any contest other than the amount necessary to pay for the birds shot at.

The following are the scores of Wednesday's contest:

Ed Bingham, 0, 32	21212211110222222022	—18

Felton, 27	22021121122001022021—15—1—16
Foss, 30	21111112101100101220—15—2—17
Amberg, 30	21010122111101012022—15—1—16
S Palmer, 30	22022 22111121121220—18—2—20

Palmer won the medal.

BELLE MEADE OCTOBER SHOOT.

There is one shooting point in the South which is coming into rapid and deserved prominence as a gentlemen's shooting rendezvous, the Belle Meade shooting park, on Geo. Jackson's farm, near Nashville, Tenn. Better grounds than these are not to be found anywhere, and all who have been present at the meets held there are high in praise of all the arrangements. As noted earlier, there will be a tournament held at Belle Meade farm this fall, Oct. 18-21. I am in receipt this week of advices from Mr. W. R. Elliston, secretary of Belle Meade Gun Club, which give the conditions governing it. I notice the usual clause that "dropping for place will not be tolerated," and I am disposed to believe that for once this warning has a real meaning, were it possible to suppose that any place dropper could or would sneak in among the sort of men wanted at Belle Meade. As being of interest to many readers of FOREST AND STREAM in the South, I append the conditions of Belle Meade tournament:

The first two days will be devoted entirely to targets. There will be eight 20-target races each day, with $20 added in each event, entrance $2.50. Five moneys as follows: 30, 25, 20, 15 and 10 per cent. There will be $15 average money each day, $10 to first and $5 to second high guns. Targets will be thrown at 2 cents. Two sets of traps, Sergeant system and magautrap, will be used. The third and fourth days will be given to live-bird shooting. On the first day the Gerst Brewing Company live-bird handicap will be contested. The conditions of this race are: 15 pigeons, $15 entrance, birds included, $50 added, three moneys, as follows: 50, 30 and 20 per cent., handicaps 25 to 31yds. Birds trapped at 25 cents each. Before this race a 7-bird miss-and-out will be shot, $5 entrance, amateurs 28, experts at 30yds. Following the handicap a 10-bird miss-and-out, $7 entrance, conditions same as above. All other events will be arranged to suit the contestants. The last day will witness the shooting of the first annual Belle Meade handicap; conditions, 25 live birds, $25 entrance, birds included, $100 added. Four moneys, divided 40, 30, 20 and 10 per cent. Handicaps same as in Gerst live-bird handicap. American Association rules will govern all events, and 50yds. boundary in live-bird events. Both handicaps are class shooting.

The Duncan Hotel, of Nashville, will be headquarters for shooters. A special rate of $2.50 per day has been secured. Application for special one and one-third fare rate from all points on the certificate plan has been made, and will no doubt be arranged for before programmes are issued. Programmes will be out about Sept. 10, and will be mailed on application. Belle Meade Farm is situated four miles from Nashville, on the Harding turnpike, and the N. C. & St. L. R. R. runs through the farm, Belle Meade Station being within easy walk of the shooting box. There are two sets of live-bird traps, underground trapping and disappearing traps. Shooting will begin at 9 o'clock. A special train for the shooters will leave the Union Station, Nashville, at 8:30 o'clock every morning, returning after the programme is completed.

The pigeons trapped on these grounds are equal to any found in the East, and a special lot will be selected for this tournament. The Belle Meade grounds are perfectly appointed, and many prominent shooters say they are the fastest in America. Shooting can go on uninterrupted, rain or shine, but in October this country is at its best, and the climate most delightful. It is our purpose and determination to make this tournament pleasant for all, and fair treatment is assured everyone. The promoters' only object is to bring together a large gathering of gentlemanly sportsmen, and no gentleman will be barred, but we do barr 10-gauge guns and black powder, and place dropping will not be tolerated.

Handicapping will be done by a committee of three selected from the shooters present.

Each day a fine lunch and barbecue will be served on the grounds, free of cost to the shooters. All added money is guaranteed by the Belle Meade Gun Club. Gen. W. H. Jackson, president, and W. R. Elliston, secretary and treasurer.

DULUTH TOURNAMENT.

The two days' tournament, the sixth annual, of the Central Gun Club, of Duluth, Minn., was concluded Aug. 12, but the scores may be worth printing for the record. Tom Graham shot so well that there is talk of watching him in coming amateur tournaments. Scores:

	1st day.	2d day.	Total.
Graham	142	139	281
Taler	132	139	271
Delaware	134	135	269

WAUKEGAN GUN CLUB.

Waukegan Gun Club, of Waukegan, Ill., is in a very flourishing condition. It now has 100 members, and after Sept. 1 will raise its initiation fee to $5. Following table has been compiled by the secretary, showing the standing of members in the four last shoots, as well as from the time since the members entered the organization:

	Per cent. in handicap shoots.	1898 per cent.	Total av. since entering club.	No. handicap shoots.
Bullock	82	74	67	..
Van Deusen	67	65	47	4
Weiss	61	56	56	4
H Bangs	57	59	62	4
J Graves	57	69	66	4
Efinger	55	47	50	4
Jemison	16	20	20	4

SHEBOYGAN SHOOT.

The tournament of the Sheboygan Gun Club called out about thirty-five shooters from Sheboygan, Milwaukee and adjoining towns, Aug. 15. Milwaukee sent sixteen good men, who were prominent in the finals.

MILWAUKEE GUN CLUB.

At the regular shoot of the Milwaukee Gun Club, Aug. 14, the following scores were made, at 25 bluerocks:

Duval 18, Wulf 23, Cantillon 20, Wulf 17, Campbell 19, Duval 18, Wulf 21, Okershauser 22, Wulf 19, Okershauser 17, Wulf 19, Cantillon 15, Duval 13, Cantillon 21, Duval 10, Wulf 18, Cantillon 19, Cantillon 17, Okershauser 20, Duval 14, Okershauser 22, Wulf 19, Cantillon 22, Duval 16, Cantillon 18, Duval 14, Cantillon 16, Duval 13, Wulf 20, Okershauser 18, Wulf 16, Cantillon 17, Duval 8, Wulf 22.

In a live-bird contest, Wulf and Cantillon against King and Keifer, the following scores were made:

Wulf 23, Cantillon 22—45. King 21, Keifer 22—43.

McLEAN COUNTY GUN CLUB.

McLean County Gun Club, of Bloomington, Ill., had bad weather for their shoot of Aug. 17. Scores, handicap, 25 targets: M. C. Barnes 21, L. Kohler 19, McCormick 23, McDermand 17, Thomas 14, Holland 19, Ross 25, Fleming 20.

THE HOODOO TROPHY AGAIN.

On Friday afternoon, Aug. 26, at 3 P. M., the contest will be shot between Mr. V. L. Cunnyngham, challenger, and Mr. T. P. Hicks, holder of the Chicago challenge trophy. We may always expect something weird in connection with this emblem, and something weird comes out in the handicap which is reported to be set for this event. Mr. Hicks, who won the trophy from Mr. Paterson in the last contest, had 2 birds conceded to him over Paterson. Mr. Hicks shoots a 10-gauge gun, and on next Friday will be placed at 30yds., to shoot at 25 birds. Mr. Cunnyngham is practically placed at scratch with him, being stationed at 29yds., to shoot also at 25 birds, no extra birds being given him whatever. Mr. Hicks had 2 birds conceded him against the holder of the medal, but Mr. Cunnyngham has no birds at all conceded him against the holder of the medal. Yet the scores of Mr. Cunnyngham in his former competition for this medal were in his first match 20 out of 26, and in his second, the tie match, 12 birds out of 26! It is hard to follow, off hand, the process which would place these two men at practically the same mark, for though Mr. Hicks shoots 1yd. further back he uses a 10-gauge gun.

If this were not sufficiently weird, it may be added that Mr. Mussey, chairman of the handicapping committee, has been out of town a couple weeks, and if he has been consulted it must have been by mail, though at this writing that cannot be determined. Mr. Mussey's name is signed typewritten to the typewritten letter of the trustees announcing the handicap. It should be added, of course, that Mr. Hicks himself is one of the trustees. He has from the start been anxious to shoot for this trophy. It is difficult to see how under the rules he can compete in this contest, as the rules state the handicap must be set by a "majority of the trustees." Of course this majority may have been obtained if Mr. Mussey has been consulted. Certainly Mr. Hicks could not under the rules of sport serve on the handicap committee when he was one of the men to be handicapped.

The other member of the committee, Mr. W. L. Shepard, oddly enough was the very first man who wanted to challenge for this trophy, but whose challenge was thrown out because he had not complied regularly with the rules. I do not know whether Mr. Shepard still retains his wish to contest for this trophy. Mr. Mussey has not yet expressed a desire to shoot for it. In case Mr. Mussey should remain absent from his duties as one of the trustees, so that only Mr. Shepard and Mr. Hicks were left on the committee, I would suggest that Mr. Shepard challenge Mr. Hicks for the trophy, for of course Mr. Hicks will win in next Friday's contest with Mr. Cunnyngham, and that Mr. Shepard and Mr. Hicks then arrange the trifling matter of handicap to suit themselves, and have a good time shooting it out together! It might be possible for Mr. Mussey then to challenge the winner, but I hardly think he will do so. These are the last facts in the history of this hoodoo trophy, which started out with a large foreordained string to it.

COMING EVENTS.

Schmelzer Shooting Carnival, fifth annual, at Kansas City, Sept. 7-8-9, will be one of the big fall events. The programme is a handsome and complete one, and the three days will be chuck full of interest. The announcement says there will be "merchandise prizes for amateurs, sweepstake shooting for professionals and manufacturers' agents, live-bird contests, glass ball contests, rifle contests, and a good time for all."

Crystal Lake Gun Club has out its tidy programme for its tournament at Urbana, Ill., Sept. 13-14. Targets 2 cents. Magautrap.

POSTPONED.

The Michigan Trap-Shooters' League, as I am advised by Sec-

retary W. H. Brady, has postponed its grand annual tournament until Sept. 13-16 inclusive, the shoot to be held at Detroit, Mich.

E. Hough.

1200 Boyce Building, Chicago, Ill.

EUREKA GUN CLUB.

Aug. 20.—The Eureka Gun Club held its regular weekly target contest to-day with a good attendance. The day was a propitious one. A mild wind blew from the right quarter, accompanied with a soft sunlight. The majority of participants did remarkably good shooting during the day.

Nos. 3 and 4 were team races, 25 targets per man. The magautrap was used throughout.

Nos. 1, 2, 3, 5 and 6 were known traps, unknown angles; No. 7, unknown traps, and angles, one man up, and No. 8 was at pairs.

In the trophy event, at 25 targets, known traps, unknown angles, M. Fehrman won Class A in the shoot-off with Eich and Graham, each having broken 23. S. M. Young won Class B without a tie, and J. Workman won Class C on the shoot-off with De Maris.

Individual Championship Cup.

Sherbrooke, P. Q., Aug. 13.—Goodhue won the individual championship cup again at Sherbrooke, after one of the most interesting shoots ever held on Sherbrooke's grounds. Goodhue beat Craig by one target, and is again the holder of the cup.

Both shooters were "all in it" and shot to hit. At the end of the 20 known Craig led by one, and held it up to the 10th target at unknown angles. He missed his 12th and 14th in the 20 unknown.

Goodhue didn't, and at the end of that series was one ahead. In the 5 pairs Craig got his first 3 pairs, 1 of the 4th, and missed both of the 5th. Goodhue got his first 2 pairs, and 1 each of the others, thus holding his lead. This leaves each of them in the same position as regards prospective ownership of the cup as they were before Goodhue lost it to Craig, and the boys would like to see it flutter that way a while before anybody owns it. They would all like to see Goodhue and Craig both own it, but there are several who want a shot at it first, and then while up, it keeps up the interest of the members and brings them out. Goodhue has to come forty miles to shoot, and although a Rock Island man, is an enthusiastic member of the Sherbrooke Club, and has been since its formation. Less than the cup will bring him out though, as he shoots regularly at the fortnightly badge match, and that's more than some of the home men do.

Hovey, of Rock Island, and Bray, of Sherbrooke, have both put in challenges, and will probably shoot in order named.

In the badge match, which was shot just before the championship event, the scores were as follows:

Twenty targets, known angles: Craig 18, Goodhue 17, Bray 17, Walton 16, Slater 15, Perrett 14, Thompson 12, Foss 12.

The Interstate at Waterville.

Waterville, Me., Aug. 18.—The tournament given here by the Interstate Association for the Waterville Gun Club was brought to a most successful close about 3:15 this afternoon, and everything passed as smoothly as well-oiled machinery moves, not a single incident occurring to mar the pleasure of a two days' pleasant shoot, and not a single kick recorded.

The tournament was held on the grounds of the local club, situated about ten minutes' walk from the hotel. The club house and traps are on top of a small hill. The shooters stood on a platform about 2ft. high and faced a screen, or trap house, which is about 5ft. high, the traps being placed on a platform which brought them about on a level with the shooters' platform, owing to the conformation of the land.

When the shoot opened on Wednesday morning Mr. Elmer E. Shaner regaled the contingent with his stereotyped speech in regard to the blackboard being the official score, cautioning every shooter to keep his eye thereon if he wanted his score correct, the integrity of the referee and other details, all of which was received with a round of hearty applause. Manager Shaner also announced that the local club would give a trophy to the shooter making the highest average for the two days, and to be open to all. This was also received with applause. The impression had gotten abroad that the trophy would consist of a diamond pin, and as Fanning said he was running low on diamonds he guessed he wanted this one, and would have to have it; consequently he started right after it from the time of firing the first gun. Fanning was number one in first squad, and maintained that position all the way through the entire two days, and landed the trophy (a silver cup) with an average of .943 for two days, and he says he thinks of opening up a jewelry store. He had Sam Preble, of the home club, for a close second for the first day, being only 6 targets in the lead; but on the second day Sidney Green, also of the home team, got into the running, and Preble fell behind, Fanning finishing ahead of Green by 9 targets.

On the first day, when number one squad had finished the ninth event, a strong wind sprung up, which caused the targets to shoot into space as if they had been fired from a catapult and went soaring skyward, and many a goose egg was marked up as the result. Dickey in this event only scored 10 out of 15.

Twenty-seven shooters faced the traps on the first day, and thirty-one the second, with an average of about twenty-five who shot the entire programme of two days.

It is not often that shooters are favored with a band concert, given for their express benefit, but such was the case here. The local club had arranged for and entertained us with a band concert on the grounds facing the hotel Wednesday evening, and the Waterville band entertained us for an hour and a half with most delightful music, which was greatly enjoyed by all, including a large number of the citizens. Another thing we must call especial attention to was the most excellent dinners furnished on the grounds. The Waterville boys could not secure a caterer to furnish the dinners, so they took matters into their own hands, and securing the services of a good lady cook they had a large range set up, and provided cold meats, fresh salmon salad, hot baked beans, most delicious hot corn on the cob, tea, coffee, milk, pies, pickles, etc., and all for 50 cents. My, but you should have seen the numbers of ears of corn which Ben Norton and U. M. C. Thomas got away with! Norton complained afterward that he had a bad case of indigestion, and said he could not shoot as the result. At any rate he fell away behind on his work of the second day as compared with the first. The first day he shot remarkably well, while U. M. C. Thomas showed up strong on the second day, as did also Du Pont Collins. These three, while being known as trade representatives, still are well known as being not expert shooters, and are not paid for their shooting abilities, but for the good they may do in talking up their powders, shells, and making friends among the boys. The trade was represented by J. S. Fanning, of the Gold Dust powder, and shooting it to the front, as he always does; J. R. Hull, of the Parker gun; H. P. (Du Pont) Collins, with Du Pont Smokeless; B. H. Norton, of the Hazard Powder Company, shooting and pushing Hazard Blue Ribbon smokeless, and he has done a world of good in this neck of the woods for his powder, as the entire membership of the Waterville Gun Club are now using it as the result of his work among them last year; U. M. C. Thomas, of Union Metallic Cartridge Company; O. R. Dickey, of the Parker Gun, The E. C. & Schultze Powder and United States Cartridge companies, and E. C. Ferriday, of the Laflin & Rand Smokeless, who came up in place of Old Reliable Ed Taylor, who had expected to be on hand, but was prevented by sickness, so he sent Ferriday instead, and this young gentleman, while he did not shoot a gun during the entire two days, still was busy making friends for the new Laflin & Rand Smokeless. The visitors from out of town comprised Messrs. Stevens and Leighton, of Haverhill, Mass.; Mr. Chas. L. Clark (Chase), of St. Louis, Mo., and a corking good shot by the way, as he only failed to get into the money in two or three events for the two days; Rich Hunnewell, of South Danville; Ashley, L. M. Norton, and Conner, of Auburn; Dennis, of Portland; Capt. Wadsworth, of Boston; Henderson, of Hingham; Griffith, of Pascoag, R. I.; Sawyer, of Cambridge; Parsons and Clark, of East Wilton; Cain, of Lewiston; Crosby from Bangor; and Messrs. Stobie, Green, Wyman, Preble, Reid, Dwinnelle and Davison held up the honors of the Waterville Gun Club, while Messrs. Harrington, Libby, Files and Whitmore represented Gardiner, Me., and Root, Providence, R. I.

The cashier's office was looked after by Mr. G. K. Bassett alone, and he did his work most remarkably well, and seemed to have no trouble in working out the intricacies of the Rose system. Mr. Herbert W. Rowe, editor of the Maine Sportsman, filled the thankless position of referee for the entire time, and his decisions were never questioned, which shows he was fully competent.

Taking it all in all, we have had a most pleasant time, a successful shoot, and our thanks are due the Waterville boys for their untiring efforts in our behalf. We trust we have the pleasure of being with you again in the near future. Au revoir!

Pryor.

Sherburne Gun Club.

Sherburne, N. Y., Aug. 13.—The scores made Aug. 10 and 11 at our tournament are given below. They would have been much better but for our using a new target, which was very hard to break. Seventy-five per cent. of the pick-ups were hit with from one to six shot.

Event No. 11, each day, was at 10 singles and 5 pairs:

J. Paddelford.

Championship of Arkansas.

Fort Smith, Ark., Aug. 12.—Joe Matthews, of Fort Smith, won the State individual championship medal from John J. Sumpter, Jr., of Hot Springs, at this place, to-day—score 41, 42, out of 50 singles, unknown angles.

It is a challenge medal, subject to challenge every sixty days on deposit of $10 on the part of the challenger, and the holder has a right to name the grounds on which the match is to be shot.

Mr. Sumpter very generously waived his right in the matter, and named the grounds of the Fort Smith Gun Club. The match was shot as above, Mr. Matthews winning by the narrow margin of one bird. The match was not decided until the last bird was broken. Everything moved off smoothly, and the winner was warmly congratulated by the loser at the conclusion of the contest.

A number of sweeps were run off in connection with the championship event, and as the money was divided four moneys, equitable system, everyone was well pleased, as everyone called on the cashier for some money. Nobody got rich and no one lost all he had, and that is what makes new shooters and keeps up the shooting game.

The day was an ideal one for shooting; no wind to mar the perfect flight of the targets, and, while the scores ruled low, it must be remembered that the majority of the shooters were new at the game.

The State medal was put up at open contest two years ago at the annual meeting of the Arkansas State Sportsmen's Association at Pine Bluff, and at that time was won by Mr. Hamilton Connor, of Little Rock. Mr. Geo. Clements, of Pine Bluff, was the first challenger. He won from Mr. Connor, and subsequently lost to Mr. John J. Sumpter, Jr., of Hot Springs, who held the emblem without challenge until the recent State tournament at Little Rock, July 26-28, when it was redeemed by the Association and again put up in open competition. It was again won by Mr. Sumpter, who has just relinquished it to Mr. Matthews.

The new champion bears his honors modestly, and will probably be in trouble every sixty days, as all the boys in this section declare their intention of taking a shot at him. Mr. Matthews is always a dangerous opponent, however, and will probably give anybody a game that goes after him.

Following are the scores of the match and the sweeps:

Matthews	1110011011111110111001111111111111111111110111101111—42
Sumpter	1001111111001101111111111001011111111111111101111111—41

Secretary.

Franklin Gun Club.

Enosburg Falls, Vt., Aug. 11.—The first meeting of the Franklin County Gun Club was held at the Quincy House, in this place, on Aug. 11. It was called to order at 10 o'clock A. M. by N. P. Leach, who was made chairman of the meeting, with J. M. Jeffords temporary secretary. The following officers were elected: N. P. Leach, Sheldon, President; H. B. Loverin, East Berkshire, Vice-President; J. M. Jeffords, Enosburg Falls, Secretary; Arthur Gallup, Sheldon, Treasurer; B. B. Perkins, St. Albans; E. F. Greenwood, Enosburg Falls; H. C. Ayer, Richford; H. W. Soule, Fairfield; E. Bradley, Swanton, Committee of Management. Local committees were appointed as follows: Enosburg, A. R. Bell, C. H. Stetson; St. Albans, C. H. Sabin, C. L. Moren; Swanton, C. C. Gilmore, Frank Lapel; Fairfield, A. E. Selby, E. A. Wells; Berkshire, W. S. Rublee, A. W. Paxman; Highgate, Wm. Austin, Arthur Rouseau; Sheldon, S. B. Thomas, Ralph Dunton; Richford, F. W. Mitchell, Howard Gibson. Richard Ward, of St. Albans, was appointed Captain. In the afternoon the party repaired to the Marsh Park and indulged in trap-shooting. There is a membership now of about fifty. The club starts out under very auspicious conditions, much enthusiasm being manifested, and will no doubt prove a source of pleasure to its members and result in a greater interest in genuine sport.

No. 1 was at known angles; No. 2, expert rules, three moneys, class shooting. Second money was divided; third was shot off miss-and-out, Bart winning on the fifth target. Several of the members faced the score for the first time. The scores:

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, SEPTEMBER 3, 1898.

VOL. LI. No. 10. No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

AMATEUR PHOTOGRAPHY.

THE FOREST AND STREAM'S announcement of prizes for amateur photography, will be found on another page.

LAND VS. WATER.

IN FOREST AND STREAM of Aug. 20 we called attention to an inquiry for statistics as to the producing power of waters stocked with fish, and asked whether any one had information on the subject. In response to this, we have received a letter printed in the Indianapolis Journal by Mr. W. T. Dennis, of Richmond, Ind., now or formerly a State fish commissioner. This we print in another column.

This letter reminds us of the very early days of fish-culture, twenty-five years ago. Then it was just beginning to be known that fish could be artificially reproduced, and enthusiasts in fishculture showed by figures, in which no flaw could be picked, that the water could be cultivated with vastly more profit to the farmer than the land. Each pond and brook on the farm was to be stocked, and to return to its owner as profit hundreds or thousands of dollars, not of gold or silver, for then the commerce of the United States scarcely knew metal currency, but dollars of good green paper. The contention of the fishculturists was precisely that of Mr. Dennis in his recent letter. They declared that a pond of certain area would support a certain number of trout. These trout, properly fed, would gain in weight a pound each year. Trout were worth a dollar a pound. Deduct from the number of pounds of fish that the water would produce the cost of care and feeding, and there remained the annual profit. It looked beautifully on paper, and many men invested capital and two or three years' time in the business. But it may be doubted if one per cent. of them ever received back their capital and ordinary day's wages. The figures did not lie perhaps, but the premises on which the argument was based were faulty. It was a case of the survival of the fittest. Ninety-nine men failed, and the hundredth, who succeeded, continued to carry on the business, but found that he must be satisfied with profits much more modest than the figures of the enthusiasts showed.

Mr. Dennis proves to his own satisfaction that while an acre of land under favorable circumstances will produce beef of the value of $20, from which $5 must be deducted for expenses, leaving a net profit of $15, an acre of water will produce in one year fish to the value of $5,000, leaving a balance in favor of the water of $4,985. Let us see how this will work out.

The pond of which Mr. Dennis writes was wholly new, having been dug out of a gravel bar to a depth of 6ft., and only filled up with water in the autumn of 1894. In the spring of 1895 four pairs of adult small-mouthed black bass were put in it, and bred in the summer. The young bass were seen by Mr. Dennis about Sept. 1, at which time they were "a little more than three months old, from 3½ to 5in. long, lively, healthy and in countless numbers." The following winter the pond froze nearly to the bottom, and in spring hundreds of small bass were found dead about the margin of the pond. In August Mr. Dennis caught some of these fish, now fifteen months old, and found them to run from 11½ to 15in. in length, the smaller size weighing 13oz. on the scale, the larger a little over a pound. He calculates, therefore, that these bass in their second summer had grown from the egg to a pound in weight.

Obviously the first question concerning the growth of these bass has to do with the food supply. A pond like the one in question would soon become stocked with entomostraca and some insect larvæ, which would furnish food for a small number of bass, until they were 2 or 3in. long. Then the food supply being exhausted, the stronger fish would prey on the weaker, and many would die. It is as absurd to think of growing fish without food as it would be to grow cattle without pasture. True, a fish does not show the effects of hunger as quickly as warm-blooded animals, but it will starve in time, and certainly cannot grow without food. The number of fish that any pond will sustain depends on its food-producing capacity, and a pond can be overstocked as easily as a pasture.

Our experience of the growth of small-mouthed black bass in Northern waters does not agree with that of Mr. Dennis. But this question of growth depends so entirely on the food supply that it is not a safe matter to generalize on. It is understood, however, that the fish spoken of in this letter had no food except their fellow bass, and that whatever growth they may have made was at the expense of the numbers of fish in the pond.

Mr. Dennis figures out 50,000 bass to his acre of water. No doubt he remembers that in an acre—whether of land or water—there are but 43,560sq.ft., into which 50,000 1lb. bass must be packed nose to tail, though we acknowledge that each would have 10in. or more room on either side. The mental picture of such a pond so stocked makes us think of the swarming salmon which we have seen running up the rivers of the Northwest coast at spawning time. There would be one and one-seventh bass to the square foot of area; but, of course, in a 6ft. pond there would be considerable room between the surface of the water and the bottom in which these bass could take exercise. Still, even Mr. Dennis must acknowledge, we think, that the pond would be crowded; too much so for comfort, though perhaps their inability to move about very much would make them take on fat more rapidly, and so weigh more.

But whatever may or may not have been the increase and growth of the fish in this particular pond, the deductions which Mr. Dennis draws from the facts and his generalizations as to the returns from bass farming are more grotesque than reliable. He figures out an annual production of $5,000 per acre. For the 300,000 acres of water in Indiana that would mean a product of one billion five hundred million dollars ($1,500,000,000), a sum almost equal to the national debt. These extraordinary figures are obtained by calling 7,200ft., the area of the pond, one-fiftieth of an acre, when actually as a matter of pure mathematics that area is only one-sixth of an acre. Sanguine persons who may be persuaded by these Indiana estimates to grow an acre of bass would do well to remember that it will be only on the actual fish they may raise to sell, and not on expansive blunders in arithmetic, that they will realize in hard cash.

THE SPORTSMAN AT HOME AND ABROAD.

THE proper observance of all laws is obligatory upon the people, whether they are at home or abroad. Laws for the protection of game, for limiting the time and manner of its capture, and for limiting and qualifying the title which the possessor of it may enjoy, are laws to be regarded just as are all other laws of the land, and equally entitled to the observance and respect of everyone.

There is a class of men, however, by no means small in numbers, who, while commendably law-abiding in their places of domicile, do not hesitate to break every game law which circumstances will permit when they are in a strange section of their own State, or in another State than their own. Generally, when in a strange State, they abandon themselves to the greatest lawlessness, so far as game laws are concerned, seeming to act on the theory that the game laws of any State other than their own do not govern them in fact, and that therefore they may slay and waste with no other limitation than their own sweet wills. They take occasion, however, to be as secret as possible in the exercise of their lawlessness, so that unpleasant legal entanglements with prejudiced State officers may be avoided.

If such offenders were told that they were both law-breakers and cowards as well, no doubt they would affect great indignation thereat. Nevertheless such violation is cowardly, since the stranger in a strange land, who is intent on selfish purpose which conflicts with the game laws, presumes more or less on the hospitality of the State whose laws he breaks and on the leniency commonly shown to strangers. Moreover, among a strange people he takes the chances of detection and conviction which he would not take in his own place of domicile; for in the strange place it is but a passing incident as he weighs it, while at his own home it would carry a stigma which would stay with the offender through life.

Few law-breakers in a strange State ever consider that they have a representative character as well as a personal one; that their misdeeds reflect in a way on the people of their own State; for everyone is predisposed to judge the people of another State by the people who come from it, and whom he meets. Therefore a sportsman in a strange State has not only his own law-abiding conduct to observe, but he should scrupulously guard against committing any illegal acts for the sake of his own fellow citizens at home.

The affectation of irresponsibility while being a temporary dweller within a State is false in conception and pernicious in practice. No law-breaker, who gratifies his own selfish purposes with such disregard of law and the rights of others, believes for a moment that he is doing what is right. His own selfish wishes, interests and self-indulgence are simply set up as being paramount to all other considerations, the same as with any other law-breaker, who differs from the poacher only in the kind of law he may break and the degree of it.

Such men do infinite harm to the cause of the genuine, law-abiding sportsman, of him who is a gentleman whether at home or abroad. By their lawlessness and entirely selfish disregard for the rights of others, they furnish cause for more stringent laws to be enacted against non-resident sportsmen in such States as have discriminating laws, and they hasten the enactment of such laws in States which have them not, to say nothing of bringing non-resident sportsmen under the ban of unpleasant suspicion and disfavor.

The laws of any State, in general and in particular, apply alike to its own citizens, to the citizens of other States, and to foreigners who are within its boundaries. All the people within its limits are alike subject to them. As with the laws of a State, so it is with the laws of a foreign country; hence the sportsman who goes from the States into Canada, or other foreign country, is subject to its laws the moment that he crosses the boundary line.

The feeling of irresponsibility in respect to the observance of the game laws, exhibited by many when in a strange section, seems to be many times multiplied when they are in a foreign country. Shooters sneak over the line into Canada, along the borders of the chicken country, kill a bag of chickens, and if a safe return is made look upon it as a pleasing shooting experience, enhanced by a spirit of adventure. So with others who shoot big game in a foreign country. This feeling and such acts are entirely wrong. Instead of devising ways and means to violate the laws, the visiting sportsman should be conscientiously careful to properly observe all laws, and should consider himself in a way the guest of the country he is in, precisely as he would observe all the proprieties in a home where he chanced to be a guest. Besides his personal character, as already suggested, he has a representative character of which he cannot divest himself if he would. As he conducts himself, so will his own countrymen at home be judged. There thus should be a double incentive to obey and respect the laws; that is to say, first because it is right to do so; second, for the good name of one's own people.

The greater the attainments of the citizen, the greater are his responsibilities in these matters, and therefore the greater are his obligations to lead an exemplary life. *Noblesse oblige* is a maxim of antiquity, but none the less potent in its application to the affairs of the present than it was centuries ago. The man who in a high station in life breaks his country's laws sets an example by which the humble law-breaker seeks to justify his own lapses.

Instead of looking upon the game resources of a foreign State as proper material for plunder, let the sportsman consider them as the belongings of his host, and govern himself accordingly, as becomes a good guest and a law-abiding citizen. At home, if he affects to be a good sportsman or a good citizen, or both, he will not go wrong if he is properly considerate of the rights of others; for all laws aim to embody the proper rule of action for the best interests of all.

The Sportsman Tourist.

In Costa Rica Forests.

We were to make our start from the City of San José, the capital of the republic of Costa Rica, and one of the healthiest and best located towns in Central America. It has an elevation of 3,800ft. above the sea level, and a temperate climate. A situation but ten degrees from the equator and a temperate climate do not seem to go very well together, but the climate is due to the elevation above the sea. The roses bloom in December as well as in June.

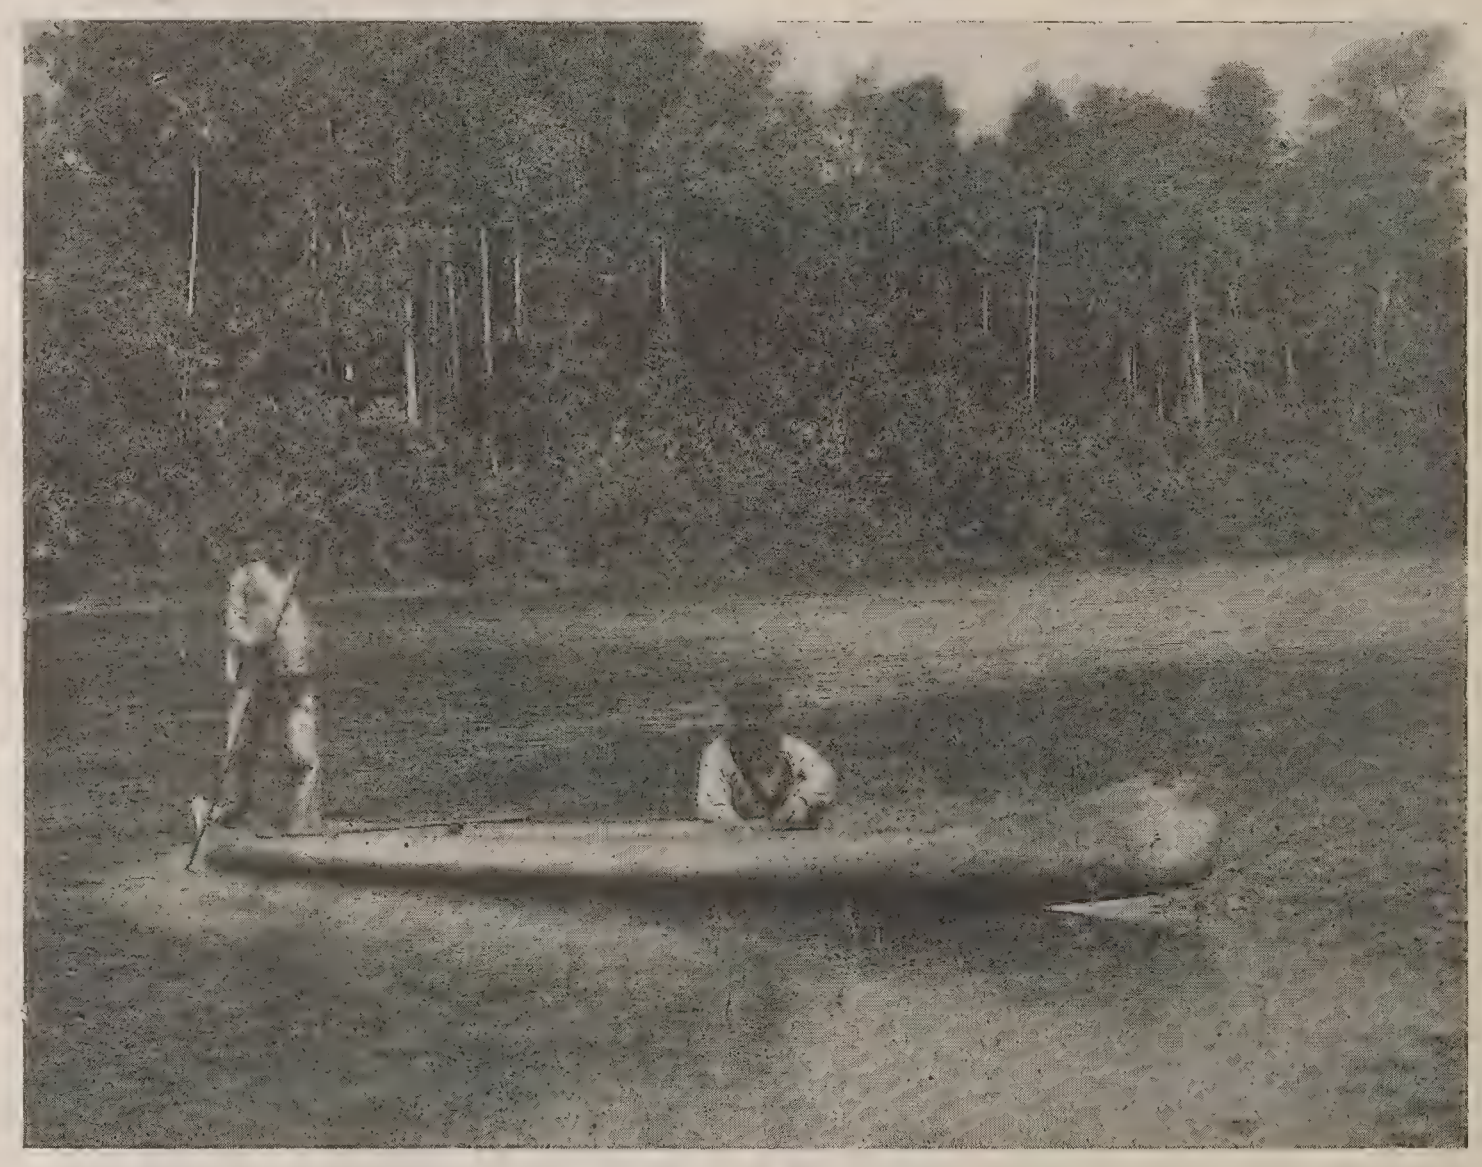
There were three of us—an Englishman, myself and my German friend, who was the linguist of the party, very fat, very jolly and the master of half a dozen languages. I wonder if there is a spot on this earth where one can go and not find some member of the German race very much in evidence? They are good linguists and more adaptable to their surroundings than we Americans, and are very apt to marry and settle down in Spanish-American countries. Our German friend was interested in everything, and always had his joke ready, and also an inexhaustible supply of stories, having been a resident of Costa Rica for the last fifteen years and speaking the Spanish language like a native.

Saturday morning we strolled down to the horse market, which is held one day of each week in an open field on the outskirts of the city. It did not take me long to buy myself a strong gelding, whose only bad habit was always to try to start off as I tried to mount him; $80 was the price in Costa Rican money. Our German bought for $60 a big white mare—and a weight-carrier. Our horses were good enough for traveling over rough roads, and could make their forty or fifty miles a day up hill and down. When one has seen Central American roads and traveled over them he will have considerable respect for a horse that can travel fifty miles a day. A rich hacienda owner will pay $3,000 to $5,000 for a fine Peruvian stallion, and put out as much as $500 on his saddle, heavy with hammered silverwork. I have seen fine saddle horses in Paris and New York, but none finer than here in San José.

A few days later we left San José and made Alajuela that afternoon, putting up at a wretched hotel. We carried our outfit in our saddlebags and took pack horses. The German was flea-proof, and so got some sleep that night. Not so Mr. B. and myself, and we were glad to get our coffee at 5 A. M. and to leave at 6. We made about fifty miles that day, and in the late afternoon reached a pretty little village away up in the mountains, and were glad to borrow all the blankets we could procure. We stopped with a man that kept a small shop, and next morning when we came to pay our bills our host would receive no pay. He would not take our money, but "was glad of the pleasure it gave him to entertain us," and all this in the most perfect Spanish. So we bade him good-by, and he expressed the wish that God would be with us. At more than half the places they would not take our money. Rather a contrast to our own country, is it not?

The third day we had crossed the main ridge of mountains, and after riding for some four hours with the clouds all shut down about us we at last had our first look at the beautiful valley of the San Carlos, the garden spot of all Costa Rica, but as yet almost a wilderness. The clouds broke away, and far, far to the north, as far as the eye could see, stretched this always green level valley, with the river San Carlos winding its quiet way through it until it joins the San Juan River, some seventy miles above Greytown.

Two superb birds of paradise flew across our road and lit on a small tree within easy gunshot. Mr. B. dismounted, and I held his horse while he slipped a couple of shells into his gun. At the first shot down came one of the birds, as big as an English pheasant, but the other got away; it turned out to be a fine specimen of the lyre bird, and to kill it seemed a shame, as we had no use for the feathers. As we were examining our prize we were startled by a most peculiar roar, which seemed to come from the mountain side, half a mile to the east. It sounded like the roar of an African lion, but the German told us it was the great Congo ape, as it is called in Costa Rica, and that the ape was thirsty and calling for rain; and it is a curious thing that before each shower one can hear them roaring or calling each other through the jungle.



That night we slept at a cattle ranch some five miles from the San Carlos River. It was 4 in the afternoon when we reached the ranch house, and as we waited for supper an incident happened that shows the cruelty of the native Costa Rican to horses. The owner of the place was doctoring a big open sore on the back of one of his horses, and every time he put his hand on the horse's back the poor brute would tremble and try to pull away. At last the man lost his temper completely, and in a fury of passion seized a 3ft. long club and beat the poor animal over the head and sore back until he had exhausted himself. The sight was so sickening that we entered the house in disgust. This is only one example—I could cite a dozen—to show what brutes some of these people are to their horses.

That night we slept in a kind of half-open room, and in the middle of the night I was wakened by something cold and wet rubbing against my face. I struck it a blow that pretty nearly broke my wrist, sprang out of bed and lit a match, when imagine my disgust to see a six-months-old calf looking at me with a reproachful expression, as much as to say, "What did you hit me for?" I went back to bed, after having driven him out of the room, in anything but a pleasant mood, and my friends had a good laugh at my expense.

We were up early next morning and made a start before 6. For a mile we rode through pasture; then the road entered such a forest as one cannot see outside the tropics. Such trees, such interlocking of branches, such huge vines, as large around as a man's leg! It seemed as if at least twenty different kinds of palms grew there. We also saw beautiful specimens of tree ferns growing from 6 to 12ft. high. The trees met overhead and made it delightfully cool. Here and there was the much prized rubber tree; and there were different dye woods, sweet cedar and lignum vitæ being common. About the only use the lignum vitæ is put to here is to set it on fire and make it into a charcoal that is almost as hard as anthracite coal. The rubber trees are very valuable, and are constantly being tapped for crude rubber.

It was so cool in the beautiful forest road that we walked our horses, not wishing to hurry through this garden of nature's wonders. We saw any number of parrots and paroquets; also several droves of white-faced monkeys, which chattered at us at a great rate, swinging themselves from tree to tree, and traveling with wonderful quickness. The most gorgeous bird of all to be found here is the big red, blue and yellow lapa or macaw. We saw several of them, and shot two fine specimens, which we took with us and cooked for our dinner, but the meat was very dark and tough. I was surprised to see several red squirrels, about the same size as the common red squirrel found in the New England States, and with the same markings.

By 11 o'clock we reached a clearing planted to bananas, plantains, beans and yams; and after tying our horses at the ranch house walked down to the banks of a clear stream. We had at last reached the head of canoe navigation of the San Carlos River. Our German friend had visited this district before; but it being the first time Mr. B. and myself had seen the country we were enthusiastic. If there ever was a Garden of Eden on earth this must have been the place. We found several Adams, also many serpents, but Eves are scarce here, and are either young and fat or very old and wrinkled. A fat pig had been killed that morning, so that with the

COSTA RICA DUGOUT.

macaw soup, the roast pig, the boiled rice and the roast plantains, we dined in great style. The owners of the ranch were two Norwegians, as pleasant fellows as one would wish to meet; and it is a strange thing that men from a northern climate seem to be less subject to fever than the native Costa Rican. We spent several days there, and were treated with the usual courtesy which we received all through our trip. We were given the best the people had, and when we tried to pay for it the answer was, "No, señor," or "The payment has already been made by the pleasure of your company." These people are polite and gracious in the extreme, and express themselves with much more elegance than we North Americans.

The next day we had our horses put out to pasture, packed our saddles, bridles, etc., in the loft of the ranch house, and made our preparations for our canoe trip. We crossed the river to see a man who owned a large cedar canoe, which was just what we wanted. Nothing would do but we must see his cocao or chocolate trees. Ten acres of seven to ten years old trees loaded down with cocao pods, some of which were being picked at the time. A little way from where we were standing a laborer was picking up some pods, when all at once he sprang back and called out, "Un colabra grande," and sure enough it was a big snake. The huge reptile was coiled under a rock. We wanted to shoot its head off, but the old man told us to wait, and sent the laborer for a long pole. He then sharpened the end of the pole and proceeded to stir up the snake with the sharp point. In a moment the snake was biting at the stick and crawling out from under the rock. The laborer had his machete ready, and when the reptile made his next strike at the pole sprang in on him and cut his head off with one well-directed blow of the keen blade. The snake measured a little over 9ft. and was as big around as a man's leg. One must be no coward to kill such a creature! The old man and the native thought nothing of this episode, and when we went back to the house he showed us the skin of a snake his son had shot which measured over 18ft. in length. That afternoon we went hunting in the forest near the ranch. Not expecting to see any large game, I took a shotgun with me, and followed the river bank up stream, my friends striking off in two opposite directions.

I had the good luck to shoot two wild pigeons and one jacksnipe, which are plentiful. My two friends got a duck, some parrots and a monkey. We ate the duck, pigeons and snipe that night, but the monkey meat we would not touch, though the owners of the ranch fried some of it and seemed to enjoy it.

Early next morning, as we were drinking our coffee, the owner of the cocao plantation came down the river to go fishing. We had brought some hooks and lines with us, and I had a few flies, a red-ibis and silver-doctor, that had done good work at Moosehead Lake, in Maine; but not a rise could I get here (and I have tried the fly several times in the different rivers of Central America, but never with success). My two friends tried both ripe banana and a red berry for bait, but with small success. But our old friend from across the river had made up his mind to make a sure thing of it, and had brought a big coffee sack and two sticks of dynamite with fuse and caps and a man to dive for the fish.

We reached a place in the river where a small stream flowed in, and here the old man threw in his first stick of dynamite; then his man stripped and dove in for the fish that came to the surface of the water after the explosion. It was none of our business what the old man did, but we much preferred to procure our fish in legitimate manner. Out of that pool he must have taken at least 40lbs. of large "bobo"—fish that would weigh from 1 to 3lbs. each. These bobo have few bones and are good eating. One more blast down stream and the old fellow had all the fish he wanted, some 50 or 60lbs. We reached the ranch in time for a hearty 11 o'clock breakfast, after which we made arrangements with two guides to accompany us down the San Carlos River on our hunting trip.

The morning dawned bright, clear and cool; every blade of grass, every leaf, was drenched with dew. Our guides, Juan and Antonio, had everything stowed away in our two canoes. Their own dugout was a battered looking affair, but they managed it with admirable skill. We bade our host good-by, and were really sorry to leave the comfortable ranch, where we had been entertained so well. Our guides led the way down stream, we following them. There was no need to hurry, the weather was perfect, and we were in a grand country for game, so we took our time. The current was not at all rapid, and there were long stretches of dead water where it was necessary to do some paddling. The canoes used here are dugouts, cut out of a single tree, most often cedar—very heavy, clumsy affairs that a self-respecting Maine man would prefer to use as firewood, but they answer the purpose well enough, and last several years. It would be impossible to portage one; both paddles and poles are used. The guides or native hunters one learns to respect, as they are fearless, resourceful and all-round competent men, never waste powder, and fully understand their business. At 10:30 we camped on a little sandy beach above the Soubraro rapids. There we had breakfast and rested for a couple of hours. A beautiful spot it was, and the prettiest camping place on the San Carlos River. We liked the spot so well that we concluded to spend the day there. The guides went to work at once, and in an hour's time had a shack built and thatched with palms. We had our tent and a bit of canvas stretched for a dining tent. In the afternoon we saw some alligators on a sandbar some 400yds. down stream. The German had been watching them through his field glass and said that one was a monster; from where we were they looked like logs. One of our guides killed an armadillo, which he cooked for supper; the meat was white and tender, and we all enjoyed it. That same afternoon we saw the fresh tracks of a danta or tapir. The brute had been to the river edge the night before. Our guide Antonio had caught some fresh fish, so that with the fish, armadillo stew, roasted plantains, flapjacks and coffee, we made a good substantial meal. Our guides assured us that this was a great country for peccary or wild hogs, so we concluded to hunt

peccary. The next day luck was with us. No man ever need starve in Costa Rica so long as he owns a gun and "keeps his powder dry." Buckshot is the best thing to use in hunting peccaries, because one is not apt to get many open shots, the underbrush being so dense in most parts of the forest. Both Mr. B. and the German used shotguns, but I preferred to take my .44 Winchester. We left camp at 6, and after going some little distance in the forest struck a rubber cutter's trail—a narrow path, which, if we had not had experienced guides, we would have lost a dozen times in every mile. However, it was better than cutting our way through the bush. The forest was alive with bird life, gorgeous butterflies flitted here and there, monkeys scolded us from the tops of high trees, and flocks of paroquets flew away, frightened at our approach, and once Juan stopped us to point out a superb cluster of yellow orchids some 20ft. from the ground. Now and then the most delicious perfume would be wafted from some tree in blossom, and we saw an immense variety of hummingbirds. It seemed almost like twilight in some parts of the forest, the branches of the trees were so closely interlocked. Even at midday it is always cool in these wonderful tropical woods. At least they appeared wonderfully beautiful to me, coming from a northern climate. It was the first week in February, and was like a midsummer day at home.

FREDERICK S. LYMAN.

[TO BE CONCLUDED.]

In the Shasta Wilderness.

Editor Forest and Stream:

I take up my pen (that is, I have just dug it up out of a tin box full of pins, needles, tacks, nails, fishhooks and smoking tobacco) to impart to you a few things such as go to make up a system of communication used by animals of the highest order—according to our own classification. To give you "more matter with less art," I desire to say, in brief, that which follows:

Few things that appear in FOREST AND STREAM escape congestion, sooner or later, as I find time to mix them up with the brain food in my warehouse. As I glance over that sentence it doesn't seem to me to resemble anything reputable—but let it go. The world is full of trite phrases, and I am as nearly independent as mortal man may be.

With me it is on the stroke of 12 P. M., at my hermitage in the Shasta Mountains, and there is not a domesticated or civilized soul within miles of me, except two cats and a dog. We four, I am prone to believe, have souls and are civilized. Both cats and the dog are either asleep or "making believe," but they are curled up together on a deerskin mat. They never interrupt me at my midnight lamp. When I read or write they seem to signify each to each, "He's got 'em again—let us go to sleep," and they go.

But, to centralize my volley of words, permit me to say that my latest FOREST AND STREAM contains a brief article that is the inspiration of these sentences. Some two years ago I wrote you a truthful account entitled "Bees," and after this long time along comes the breezy acknowledgment, from away down in St. Augustine, that my little story amused both Mrs. and Mr. Didymus very much. They rate my sketch very highly, and if it were anything more than a truthful relation of matters of fact I would begin to feel of some consequence.

Those same bees and their descendants have been making a great deal of trouble and some honey for me since I brought them into my arena from the further woods. They have multiplied, as bees seem to have a way of doing, and I now have four colonies, while as many more have escaped into tall timber. I think I had about 20,000 to begin with, and I now have about 72,000, and six or eight that never hold still to be counted; besides about 54,000 swarmed, leaving for parts unknown, when I had my hands in the dough, from which I compile some bread, now and then, when the moon is right. At other times I utilize whatever results to ballast my fowls and other confiding, but not overly fastidious, dumb dependents with.

As to this utilization of a compound that never matures more than once in the same style, I experience some anxiety. My cats always did prefer other things to eat; my dog after a while began to evade it whenever he had any reasonable expectation of anything else during the next few days; when he felt a strong combination of the desire for something to eat and the realization that there was no quail on toast, he usually accepted my surplus pastry, and carried it off. I ascertained that he buried it, but if he ever dug it up again he did it privately, probably in the night. At present the fowls get double rations, as it were, but they are beginning to evince more indifference than hilarity. This is probably because they can't get over the garden fence after tampering with my liberality.

As I was about to say, however, some of the bees swarmed when I was involved with the dough, or otherwise indisposed, and they have doubtless established an independent government somewhere in these mountains. The colonies I have seem to be thriving and are industrious, in both of which they are not particularly consistent with my form of government. Nevertheless I have builded hives for them of several different styles, probably all of them innovations of doubtful utility.

According to philosophy, a thing that has been done may be done, but, as I have deducted from my experience, with bread for an instance, the same thing may be done differently—underdone, overdone, undone, and so on. Hence, I perpend, I can make bee hives along that perspective, and have done so, using enough nails and material to build a house.

My latest achievement is a thing of beauty and a joy, so far as I know, for some time to come. This is a hive with the inner case of glass. I have a fine colony of bees in it, and I have them in my house. The hive is fastened upon a shelf, on an upper floor, with an exit and entrance for the honey-makers outside. By opening the outer case I can observe their operations at any time, and I am at present intimately familiar with their domestic affairs. None of them has an excuse to neglect work on my account. They cannot pull down the blinds either, and when I want to inspect their works I do it. They are susceptible and become acquainted with even a persistent intruder, and they now merely ignore me. You ought to have one or two such hives in your office. What could you have more interesting or ornamental? Besides, they thrive at the expense of the neighborhood. Again, you might turn a few loose inside when you wanted to break away now and then.

What is the reason some one cannot start a bee "fad." Let Mrs. Grundy and a few other folks introduce it. Of course bees in society would have to be placed up near the eaves, where they could whizz around without getting mixed up with madame's parlors, boudoir or her unsophisticated guests. They should also be placed out of reach of Fauntleroy, who might get 'em into his knickerbockers. They do not chassez around in the gloaming, and the affairs of that season need not be interrupted on their account.

I have some other things in this neck of the woods, and hermitizing is laden with some tribulations and responsibilities. In fact, there are more things in heaven and earth, Horatio, than those in New York. I'm going to write up a small library entitled "Six Years in Solitude," or something or other. I contemplate doing up some condensed wisdom regardless of conventional ethics. If I make a drive at literature I don't purpose to snap shoot with any smaller bore than something like Suvy's guncotton eructors. I believe, however, that I'd rather go a-fishing or prowling around.

Natural History.

How Bears Feed.

I CAN verify the statement of Mr. Hardy (FOREST AND STREAM, Aug. 20, page 144) of how bears eat berries, and indeed feed in other ways. Stories of bears are current talk in the backwoods, and the old residents have learned a good deal of their habits in this way.

Often, in the then very thinly settled north Michigan woods, I have accompanied my wife on her berry gathering excursions, fearing to let her go alone on account of the numerous bears which shared the enormous quantities of the finest berries which grew in the windfalls. Once when thus engaged at one side of a gigantic pine, which lay over breast high, we heard a sort of scuffling on the other side of it, amid the dense growth of blackberries. Thinking some other person was on the same business as we were, no notice was taken, but all of us, bear as well, as we found afterward, went along the fallen pine until we came near the top of it, when looking up both of us saw at the same instant the head of a huge bear as it showed itself by its head being far above the level of ours. The bear saw us at the same instant and stopped eating, with an armful of bushes gathered between its forelegs. We did not move, but stood quite still, and very soon the bear went on with its meal, picking off the fruit with its mouth. We, of course, gently backed out of the bushes, and left the bear still feeding without any offensive movement. After that, and with some other experience that bears are by no means quarrelsome, if not disturbed or driven to resistance, or even disposed to fight when attacked, but rather inclined to get away, even the women and children of the locality were not alarmed further than to get away in the easiest manner, and leave the field to the big, black, shaggy fellows. In fact, this animal seems to be in no way quarrelsome if he is permitted to get his share of what is lying around, and is only dangerous when attacked and brought to bay.

Bears often amuse themselves in the woods by breaking trees. When camping out on exploring expeditions, or on surveys, I have heard the bears at night breaking down the limbs of quite small trees, apparently for amusement, and they are quite fond of tearing the bark from the trees, apparently for the same reason, or otherwise to get at the sweet underbark, which is doubtless what they are after. In fact, they are playful animals, and when seen without them knowing it they will play and romp together as a lot of boys will, wrestling with each other, or chasing each other in a rough sort of game, which is very amusing when their really inoffensive habits have become known. But few people care to get too closely acquainted with them.

They are exceedingly mischievous, and play havoc with one's camp and blankets, which they will tear into strips, in fact completely wrecking the outfit. Once, on going to a camp which had been left for some days, we found on returning to it a big bear in a most ludicrous mess. An old butter firkin had been left outside of the camp, of course having some leavings of butter in it. Nearing the camp we heard a noisy sort of scuffling, and at once I thought of bears. Coming near the camp there was a bear on its hindlegs dancing around in such a ludicrous manner as to throw my Canadian-French foreman in a helpless condition of imbecility and helplessness. He pranced and howled, and rolled on the ground. The bear had its head fast in the keg, and was pawing for all it was worth to get its head loose. It rolled on the ground along with Francois, who might have got into trouble had the infuriated bear got its head free. But it was not until the bear ran against a tree and knocked the staves loose that it could see what was the matter. Then it made off with the hoops around its neck into the woods, and was lost to sight. Francois did not quite recover for a long time, but would at times burst into a roar of laughter, when at serious business, when anything recalled this adventure with the bear.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

The Baltimore Oriole.

THE birds known in the United States as orioles belong to a family (*Icteridæ*) which is strictly American, and quite different from the orioles of the old world. In the family there are about forty species, which inhabit almost the entire country between the fiftieth parallel north and the fortieth south latitude.

The splendid Baltimore oriole (*I. galbula*) is magnificent in color, and is noted for its neculiar nest, hanging from some swaying branch, which, moving to and fro in the gentle breezes, calls to mind the nursery lullaby

Rock a bye, baby,
On the tree top,
When the wind blows
The cradle will rock.

As I write, by raising my eyes I can see a nest which was built this summer in the fork of a limb of a weeping willow tree. It is constructed of wrapping twine, thread, several shoe strings and small pieces of cord, and looks like an old-fashioned chain purse, knit through and through as if done by machinery. It is lined with carpet sweepings. The eggs are shining white, sometimes tinged with pink, and sparsely dotted, and line marked with purple and black.

The Baltimore oriole cannot be caged, as it will kill itself when confined. I have tried it several times. Even the young will pine away and die. This is my experience, and I have tried it several times.

I will tell you of a fight I saw between a tame gray squirrel and a pair of orioles one Sunday morning in midsummer:

The oriole had swung its nest on an elm tree across the street, in the very tip of a limb that hung toward the ground, and I suppose had eggs in the nest. As the squirrel was very fond of eggs, he decided to rob the swinging nest, and when almost down to the nest the female (which is not so bright in plumage as the male) made a dive for the squirrel. He seemed very scared, and tried to get back, but the limb being so very small, he could not make very good time. The cry of the female brought the male bird to the scene, and they proceeded to give the squirrel a good whipping for disturbing their nest. They would fly at him and strike with both wings, all the time making a loud noise, as if they wanted to scare him more than to hurt him for intruding on forbidden territory. I think they succeeded very well, as their nest was not disturbed again during the season by him.

GETTYSBURG, Pa.

The Snake as a Hypnotizer.

THERE are few persons who have not heard of the peculiar power or fascination supposed to be exercised by snakes over birds, commonly expressed by the term "charming," yet few indeed are those who have actually beheld this strange natural phenomenon.

By "charming," the reptile is supposed to get complete control of the will of the bird, so as to render the latter an easy and helpless victim. That snakes possess any such power or faculty as the one indicated has been frequently boldly asserted, and as often strenuously denied by those supposed to be well posted in such matters, and so far as I know the question still remains *sub judice*.

Having been an ardent sportsman from my youth, and like most sportsmen, a close observer of the facts of the natural world, I will now give my experience on this curious topic.

I have often known birds to make a big fuss and rumpus over a snake that they had discovered stretched out in the grass, just as I have known crows to give a bad quarter of an hour to an unfortunate owl that they had overtaken at midday in the midst of the forest, but it is only recently that I have witnessed anything like snake charming, such as I have defined above. I am now free to confess that I am a convert to the affirmation side of the question without any restriction whatever.

The facts upon which I base my new belief are these: A week or ten days since, while spending the day with a rural friend, and engaged in the enjoyment of a post-prandial pipe in the shade of his porch, my attention was attracted by the singular and unusual actions of a catbird in the lower part of the yard, which enclosed the house—the bird being some fifteen or twenty paces from where I was sitting. It was walking or rather pushing itself along a piece of board, alternately expanding and contracting its wings and tail, its body showing occasionally evidences of a trembling or convulsive movement. It uttered no note, however, that I could hear. The board or plank upon which the bird was performing these singular movements was about 3 or 4ft. long by about 6 or 8in. in width. After reaching the end of the board the bird would turn and pursue the same route back to the other end of the plank, still keeping up the singular movements of its body.

I was at first of the opinion that the strange actions of the bird were attributable to the intense heat which was prevalent at the time. Being much interested in the singular performance, and there being a lady sitting near me on the porch, I called her attention to the matter. After viewing the strange actions of the bird for a while, she declared that there must be a snake somewhere in the vicinity of the bird, for she had often heard that snakes had the power of charming birds.

In order to ascertain the cause of the bird's actions we both advanced toward it, and when within a few feet it flew up and perched upon an overhanging limb of a bush. Upon viewing the ground near which the bird had been performing its singular evolutions, we descried a blacksnake within a few inches of the edge of the board upon which the bird had been walking. The snake was coiled up, with its head in the attitude of striking. Now, as the bird, in passing along the board, must have come within a few inches of the reptile, it is evident that it was completely within the power of the latter. It may be wondered by some why the snake, having the bird thus in its power, did not proceed to devour it, but for further information on

this head I must refer the curious inquirer to his snakeship himself. I have a way of thinking, however, that inasmuch as the snake was quite a small one—not more than 2ft. in length—he may have doubted his ability to "get away" with the catbird, which was a full-grown adult.

I have now given a fair statement of the facts in the matter as they occurred, from which ye gentle reader is at liberty to draw his own conclusions and inferences. I only wish to suggest, however, in conclusion, the probability that reptiles may possess the same hypnotic power over birds that some men are known to exercise over their brethren who are the unfortunate proprietors of weaker wills than their own.

BLOOMERY, W. Va.

The Cave Roller Identified.

SAN FRANCISCO, Aug. 19.—*Editor Forest and Stream:* It is generally admitted that there are occasions in almost every man's experience when energetic language of a positive nature is excusable and admissible. Such an occasion presents itself to me now, and I am tempted to go to the extreme length of the privilege.

In reading over my chapter on "Animal Pets No. 2" in the last number of FOREST AND STREAM received, I was disgusted to see that the compositor had managed to knock out what little sense there might have been in the closing sentence of the chapter, touching upon the dilapidated condition of the dog after his fight with the wildcat. What I wrote was, "Tige might have said with the footballer:

> "Now that the game is o'er, and the field is clear,
> Straighten up my nose and help me find my ear."

Instead of footballer it was printed "cave roller," and what the deuce that word means puzzles me, and probably all who read it wondered also. No doubt many contributors to newspapers have had similarly provoking experiences, and have felt like punching the head of the compositor, but on reflection the fault often lies in the illegible copy, and possibly it was so in my case, and I am disposed to give the compositor the benefit of the doubt, especially as my chirography is nothing to boast of, so on the whole I have concluded to let him live.

PODGERS.

Game Bag and Gun.

The "Brief's" Pictures.

THE illustrations in the current edition of Game Laws in Brief, Mr. Charles Hallock says, well represent America's wilderness sports. The Brief gives all the laws of the United States and Canada for the practical guidance of anglers and shooters. As an authority, it has a long record of unassailed and unassailable accuracy. Forest and Stream Pub. Co. sends it postpaid for 25 cents, or your dealer will supply you.

Indian Modes of Hunting.

Martens.

THERE are three kinds or qualities of martens recognized by the trappers.

First.—The pine marten that is found in the country covered by soft woods, such as pine, spruce, white fir and birch. This is the most numerous and consequently the skins are of least value. They are of yellowish brown color on the back and orange on the throat, changing down to pale yellow or white on the belly.

Second.—The rock marten; this is found in a country with stunted growth of spruce timber, a very mountainous district, the chief features of which are great crevices and boulders. Some of the skins of this variety are of great beauty, being dark on back, and throat and sides of gray or stone color.

The third kind, which is the scarcest, and consequently of most value, is the marten found in the black spruce country, or swamps of northern Labrador. The fur of this variety is of a deep brown color throughout the pelt, and at times the tips of the hairs on the rump are silver gray or golden brown. The latter are very rare, and such skins have been sold in the London fur market for £5 a piece! They are also much larger that the other kinds, the skins of the male often being from 24 to 30in. long, exclusive of the tail.

The proper and most successful time for hunting is in the latter days of November and the whole month of December. They are hunted again in March, but by that time the sun has bleached out the color of the hair, which causes a depreciation in value.

As a business, trapping is the only mode of killing martens. They are rarely seen to be shot at, as they pass the days in thickets or hollow stumps, only emerging after nightfall to hunt their food, which consists of mice, birds, young partridges, etc.

Wooden traps are made in the well-known "figure-of-four" shape, and are set either on stumps or on the snow, flattened down with the snowshoes, and the trap built thereon.

It is considered a very good day's work in December for a trapper to construct, bait and set up twenty-five such traps. A real marten hunter (nothing to do with my name) camps each night at the end of his day's work until he has from 150 to 200 traps set! He generally visits them once in ten days or a fortnight, and if the catch averages one marten to ten traps it is considered very fair.

It takes the hunter two full days to rebait, clean out and freshen up such a line. When small steel traps are used instead of the deadfall, the hunter can cover more ground in a day and do better work than by making all wood traps. The steel traps are much more fortunate than the wood ones. In the "figure-of-four" traps, before the animal is caught it must seize the bait with its teeth and pull strong enough to set off the trap, whereas with the steel trap the mere fact of his coming to the doorway to smell insures his putting his foot in it, and in a moment up hangs Mr. Marten or Mr. Mink, as the case may be!

Of course the steel traps have this disadvantage—they are weighty; that is, when you have fifty and over on your back, but the man who follows trapping as a business can very easily overcome this difficulty by placing caches of traps at different places by canoe near where he proposes to have his line in the winter; and he can then branch off now and again for a new supply as he is setting up his trap road.

This leaving the main road at right angles once in a while might even be a source of profit to the trapper, for he might come across a bear den or a beaver lodge, or fall on deer tracks, and if he succeeded in killing a deer some of the sinewy parts would come in to bait his traps.

The taking of the skins off these little animals is very simple. The knife is used only about the head; once back of the ears the skin is drawn steadily until the tail is reached, the core of which is drawn out, either by a split stick or by the stiff thumb nail of the trapper. The skin is then dried on flat (three) splints, and when dried sufficiently to prevent it spoiling is tied up with others to the number of ten in each bundle, and are thus taken to the trader or fur dealer.

The first purchaser from the trapper generally buys them at an average price, but he sells them to the manufacturer selected; that is, getting a high price for the dark and a low price for the yellow or pale.

MARTIN HUNTER.

A Morning's Hunt in Florida.

"Now, my dear Paul," said the Doctor to me the day after my arrival at Waldemere, which is on a large lake in Florida, "if you want to do your share to provide for the table, you may unpack your gun to-night and go to bed early, for to-morrow morning at five I will wake you, and we will go hunting."

So to bed I went, and it did not take me long to fall asleep, nor to wake up either, when I found the Doctor shaking my elbow. "Get into your things, have a cup of coffee and come along," he said, "never mind putting on those fancy hunting goods you laid out so nicely. They'll do when you go back to civilization; while you are here, when you go hunting, you must put on the worst things you have, the worse the better, and the strongest the best."

"What are we going to hunt?" I asked, as I got into some old clothes my friend brought me, and which, when I had put them on, made me look like a New York street cleaner before Col. Waring's time.

"When we go hunting at Waldemere," he answered, "we do not go for quail or rabbit, nor any specified game, nor do we go hunting for a whole day. We do not go for the purpose of beating records. We are what you may call pot hunters. The fish we catch and the game we shoot constitute all the animal food we depend upon, milk and eggs excepted. The game is not slaughtered for the purpose of showing a big bag when we come home. We know that if we shoot more to-day than we can eat, it will be spoiled by to-morrow, and we would rather have a rabbit run in the woods until we really want it than to know that we killed it when we had no use for it whatsoever. Take a few 4s, 6s, and 8s, and a couple of BBs if you have them. If not, take anything you have, 6s in preference. I carry different sizes in the different pockets, and can change my shell pretty quick when I want it, but generally I carry 6s or 7s in my repeater. Now remember, season is open for everything, so you can shoot anything you want, only remember it is nearly 6 o'clock and we want to be back by 9, and have enough game for the whole day, but no more."

He seemed to consider all the game in the neighborhood as his, and seemed to think this part of the country a game preserve, where everybody might shoot all he wanted to eat, but no more. As he said to me, "The fish and game around here are all the butcher shop we have got, and we must see that we do not go bankrupt."

So off we started through an orange grove, I the only one carrying a gun, he playing dog for me, as he said. Whir, up started a flock of birds, about a dozen of them; my right barrel dropped one, my left missed. "Wild doves," said he, as he picked the bird up; "wilder than a Texas cowboy on a spree. Look out for that barb wire fence. There are three ways of overcoming this obstacle: crawl under, squeeze through, or climb over. Which do you choose?" I was not accustomed to fight such a foe, so I did not know what to do, but wished for a pair of wire nippers to cut the Gordian knot.

"Uncock your gun, and I'll help you through." So he held the wires apart until I managed to get through, not, however, before I had torn a bit of cloth out of the old jacket which he had loaned me.

"Now, are you not glad that I did not let you wear your fine hunting suit," he remarked, and I saw the wisdom of his way.

On we went, I admiring the regularity of the orange grove, the yellow oranges hanging on the trees, when—"Why don't you shoot?" my companion said. There was a rabbit scampering away. I pulled the trigger, but missed, and the rabbit had disappeared in the bushes. "Never mind that rabbit, we will meet others," was my host's consoling remark; "walk along that path and look out for rabbit and quail." Hardly had I made a hundred steps when a rabbit ran across my path. That may mean bad luck for anybody but a huntsman. Off went my gun, the rabbit turned a summersault and was added to my bag. One dove and one rabbit was hardly enough for a whole day, so on we went, leaving the path and tramping through a lot of saw palmettoes, seeing a great many little birds, woodpeckers, bluejays and orioles, then—up went a flock of quail—bang went my right barrel, and two birds dropped; before I had a chance to use my left the quail had disappeared in the bushes. Back we turned, and walking through the woods, were lucky enough to scare up another rabbit, which I missed with my first, but hit with my second barrel. Returning through the orange grove, I had three more shots at the doves and scored two birds. We returned with two rabbits, two quail and three doves. Counting my shells, I found that I had used just ten. We had been out just an hour and a half, and always within calling distance of the house.

"Take a rest if you are tired," my friend said to me, and I admitted that I was. Walking through the sandy soil and through the shrubs and palmettoes had tired me; but not so much as to prevent me from enjoying the dinner, of which the rabbits, quail and doves formed a part, and which were accompanied with some native guava wine.

H. O. WARD.

Reminiscences of an Old Sportsman.—XVII.

THE last time I visited the Andover covers was in November, 1878, in company with Dr. W. S. Webb, Hon. E. H. Lathrop and R. E. Sabin. We shot about three minutes the evening of our arrival, the whole of the next day and a little more than half of the day following, and our score was eighty-four birds—twenty-six grouse, one woodcock and fifty-seven quail—which is pretty good evidence that this was a game country. We not only secured a good bag of birds, but we had a most enjoyable time as well. The Doctor, Sabin and I arrived at Andover a few minutes before sunset, and not wishing to lose any time we rigged up and started out to see if we could find a bird or two. The landlord informed us that there were four partridges in a small grove of woods only a short distance from the hotel, and we decided to investigate. We had with us the well-known pointers Sensation, Whiskey and Sabin's Trump. Arriving at the grove, the dogs were sent on, and they had gone nearly through the cover when Sensation struck scent at the far upper corner and came to a point, with Whiskey backing him. Old Trump had worked out the opposite side, and had gone out into the open meadow, and almost at the instant Sensation pointed he also froze. The Doctor went to his dog, and Sabin walked over to Trump, while I formed the center of the line. As we advanced, a grouse rose near me and undertook to cross some 25yds. in front of the Doctor, but he was loaded for grouse, and brought it down in fine style. Three more rose from the open meadow beyond Trump, and Sabin got in a good double, the other one coming my way, only to share the fate of its companions.

This was capital work all around, and we returned well satisfied with our good beginning. When we arrived at the hotel the landlord threw up his hands when he saw the birds and exclaimed, "Great Scott! you've got them all! If I had thought that you would have killed one of them I would not have told you where they were, for there is where I send all the shooters that come here, and now you've spoiled the fun."

The next morning Mr. Lathrop joined us with his well-known setter Dick, and we at once made a break for the woods. Dick was a wonderful dog, fast as a ghost indeed; he was widely known as "the black whirlwind of the East;" he also had a good nose, was perfectly staunch, and was gifted with lots of intelligence. Mr. Lathrop had never seen Sensation in the field, but had been outspoken in condemning his appearance, and I waited with no little interest to see what his verdict would be when he had seen him at work. I had not long to wait, for the grand old dog soon had a bevy of quail pinned in his very best style. Mr. Lathrop gazed at him a short time with a look of wonder on his face, then he exclaimed, "I'll take it all back; a dog that can do that is above criticism."

When we flushed the birds in front of the dog I was somewhat surprised not to hear the Doctor's gun, but he informed me that this was his first introduction to these birds, and he wished to get the hang of them before sailing in. The birds settled in some fairly open cover, and when we were through with them it was the unanimous opinion of all three of us that the Doctor had got the hang of them all right.

Dick gave us a taste of his quality here that was very amusing. Mr. Lathrop signaled a point some ten rods to my left, and I started toward him just as Whiskey came past and pointed not more than 6ft. in front of me. I at once signaled a point, and as I took a step or two to one side to get clear from an overhanging branch the bird flushed from under my feet. When I brought the gun to my shoulder I saw Dick coming at his best gait, and I dropped the bird just in front of him. Without slacking his speed he picked up the bird and swung around and disappeared in the direction from which he came. When I joined Mr. Lathrop I asked him where Dick was, and he told me that he was pointing in the middle of a thicket a few steps beyond us, and he bade me go on the opposite side and kill the bird, which he would drive out to me. When we came to the thicket there stood Dick on a staunch point, with the quail that he had stolen in his mouth. Mr. Lathrop had not seen him leave the place, and was greatly surprised at the performance. Dick dearly loved to retrieve, and very often went for birds that did not belong to him; but this was the first time he had been known to leave his point for such a purpose. He knew what the signal for a point meant as well as we did, and was bound to have his share of the fun. If this was instinct I for one would very much like to know where the believers that dumb brutes do not reason draw the line.

Evening found us gathered around the cheerful fire in the bar room of the hotel, jolly and disposed to enjoy ourselves. Our success during the day had been all that sportsmen could desire, both in the way of birds and fun, and as my companions were all jolly good fellows, and peculiarly fitted to make such an occasion an enjoyable one, the time passed most pleasantly. Our pipes were all going, and we had just settled back in our chairs, when the door opened and a youth of some sixteen or seventeen years entered, closely followed by a dog that partly atoned for his rather plain appearance by the intelligent and wideawake expression of his countenance, and he completely won our esteem by the very cordial manner in which he approached each one of us in turn and saluted us with a friendly wag of his tail, then with a hail-fellow-well-met air he paid his respects to each of the dogs, and was greeted by all as though he were an old and cherished friend, even old Trump, greatly to our surprise and amusement, raised up on his haunches and reached out his paw to shake hands in the most

riendly manner. These performances naturally led the onversation to the dogs, and many anecdotes illustra- ve of their intelligence and tales of their curious doings ere recounted, greatly to the wonder and delight of our oung friend, who appeared thoroughly to enjoy each ell-told tale, and fully understand each quip and joke s well as sly innuendo that were frequently cropping out n our conversation, and so rapt was his attention, and o evident his pleasure, that we all were impressed by t, and laid ourselves out to spread before the young ellow a feast of good things that he would not soon orget, and with the inspiration born of this resolve our eance soon became deeply interesting, even to the ld campaigners. Finally Sabin related an anecdote f Mr. George Ashmun's dog Trump, about his watch- ng a boy who had chased a cat into the mouth of a rain and then procured a meal bag, and fastening the pen end over the mouth of the drain stamped on the round above until the cat ran out into the bag, when he rabbed it and whacked it on the ground until the nine ves of that cat were but a fleeting dream of the past. rump had stood some little distance away, with gently aving tail, evidently greatly pleased with the per- rmance, and was joined by his master, who saw what as going on and tried to prevent it by shouting to he boy; but that boy's blood was up; the bag was winging in the air, and before anything could be done o prevent it that cat had met its fate. The following ay Mr. Ashmun was surprised to see Trump come into is study dragging the same bag that the boy had used, nd as he took it in his hand the dog so intelligently ndicated his desire that his master should accompany im that he followed him, and was led directly to the cat hole" that had been cut in the door of the wood- lied, when, as plainly as could be done without the aid f speech, Trump asked him to fasten the bag over the ole. Upon examination a strange cat was found in he building, which the dog had probably driven in hrough the hole and then sought his master to help im bag the game. Before Sabin was nearly through with his tale I saw come over the countenance of our young riend the "that reminds me" expression with which we re all so familiar. So when Sabin had concluded I sked the boy if his dog had ever displayed intelligence f this nature, as I thought that perhaps something of his kind had been brought to his mind. Now he had ot spoken except to give us good evening when he ame in, and all of us had somehow formed the opinion hat he was only a green country lad, and none of us nticipated that my inquiry would result in anything ore than a simple negative, or at the most some com- onplace little anecdote; and we were therefore greatly urprised when in finely modulated tones and a mu- ical voice and with excellent English in response to ly question he gave us this:

"No, Plato never did anything just like that, although e is very intelligent. But the manner in which that oy caught the cat in the bag brought to mind a little dventure that I had last fall with a skunk. I have unted skunks for three years, and killed a great many, nd the oil and skins bring me in considerable money. also hunt rabbits, for Plato is a good rabbit dog, and hen he holes one I place a bag over the hole and run n a long stick, and if I can reach him he runs out into he bag. This day I was over by the reservoir, and ent to a spring to get a drink, and then I sat down near he bank of a deep gully and waited to hear from Plato, ho was searching for rabbits. I had been there a short ime when something down the gully attracted my at- ention, and I soon saw a skunk waddling along in the ottom of the gully coming toward me. So I kept uiet until he had passed me and was out of sight, when slipped down the bank and set the bag in a narrow lace and propped it open with a couple of sticks and aited for him to come back, as I knew he must, for here was no other way for him to get out. After a hort time I saw him returning, and he went all right ntil he was within a foot or two of the trap, when he topped; but I gave a loud whistle, when he popped into he bag, and in less that a second I had grabbed it and ad him safe. I could not very well climb the bank with ny load, for he was a big one, so I followed down the ully two or three rods to the banks of the reservoir, neantime contriving how I should kill my captive. inally I decided that I would whack him against a ock; so when I came to the mouth of the gully I tarted for the big rock nearly at the head of the eservoir, and as I came to it I secured a good foothold, nd taking my end of the bag in both hands I swung it round my head two or three times, and when it had btained sufficient headway I brought it down with ll my force upon the rock. But just before it struck, the ottom gave way and that skunk went sailing through he air more than 30ft., and struck the water within 10ft. f the opposite bank, and before I could get there he ad paddled ashore, and I was out about a dollar and a alf. I did not care so much for the loss of the money s I did about my wounded feelings. But the worst f the whole was to see that confounded skunk when he was paddling ashore turn his head and give me a road grin. That makes me mad every time I think of ."

His manner of telling the story took us completely by torm. Never before had we seen so well portrayed r listened to better told tale. He was a born actor, nd every little detail and incident was acted out to the fe, and we could almost see that skunk waddling down he gully, and note the inquiring look it gave when it topped in front of the mouth of the bag, which changed o a look of fright as it darted into the trap; then we aw the actor's eyes light up as he dropped into the gully nd seized the bag, and the look of delight that spread ver his expressive countenance as with labored effort e carried his prize down to the end of the gully to the ock, upon which he gazed with a look of satisfaction, hich changed to one of fierce determination as he wung the bag around his head and savagely brought down; then as his intended victim went sailing through he air it was something wonderful to see the fierce ex- ression upon his countenance change to one in which onder, surprise and disgust struggled for mastery, while is eyes fairly bulged from their sockets; but the climax ame when he turned his head partly over his shoulder, nd while imitating the paddling of the skunk he gave us that sardonic grin. This broke me all up, and I doubt if his best effort upon the stage—for he is an honored member of the profession—ever brought him more sin- cere or merited applause than greeted his well-told tale.

SHADOW.

[TO BE CONTINUED.]

CHICAGO AND THE WEST.

Chickens.

MINNEAPOLIS, Minn., Aug. 26.—So far as brief inquiry has enabled me to judge, I should say that the chicken crop is good enough to promise sport for a good many guns this fall in this vicinity. Around Fairmount there are some birds, and all the way down to the Iowa line from a point not many miles south of the Twin Cities there are more or less birds—usually less, of course, when you come to get there, but enough to make a little shooting. I was told that at Dodge Center, below here, there is a big Norwegian settlement of farmers who do not hunt a great deal, and the country is open and no objection is made to shooting. Last year and two years ago this point had a good many birds, and I should not be surprised if it were a good location now.

Mr. J. E. Robbins, of Fargo, N. D., tells me that the season for North Dakota opened with a very hot day in that neighborhood, so that the dogs could not work very well, yet himself and friends bagged some ninety birds. He thinks the crop in North Dakota is better this year than it was last.

Our friend Gokey, of Dawson, so says Mr. Robbins, reports a great many more grouse this year in that part of North Dakota than was the case last year.

Mr. John G. Smith, of Algona, Iowa, tells me that there are a good number of birds yet in his part of the country, and he does not yet see the end of the world so far as chicken shooting is concerned. He does not think that the field trials at Emmetsburg are in just the best chicken country, as the land there is all under fence and closely cultivated. Further to the northwest it would be more open, and the birds more abundant, in his opinion.

South Dakota has a pretty good crop of birds this fall, and good points named for that State are Watertown, Troy, Revillo and Waverly. At these points one might hope to get a run for his dogs, if not for his money, and that is about all that is certain of any chicken tip in these days. South Dakota can still boast that she does not freeze out the non-resident, but this boast may not be a permanent one, for there is going to be a strong attempt to frame a new law similar to that of North Dakota, with a non-resident license clause. The law in North Dakota has proved in the minds of many a desirable measure in its practical working effects.

Wisconsin has a few chickens yet unshot not far from Berlin. This is also a good place to bear in mind for ruffed grouse in season.

Around Oshkosh, Wis., there were good numbers of chickens a few days ago, but the numbers are growing steadily less under the guns of the early shooters, which are also killing off the young local ducks to such an extent as to arouse the ire of decent shooters of that city of sportsmen.

Henry Pool, Robt. Witte and Frank Kemball, of Milwaukee, Wis., went out last week to get a few chickens ahead of the season. They got the birds, and the warden got them.

A Game Country.

Among other letters asking for good shooting locations I have one from a Maryland correspondent, to whom I have written telling him I feel sure that if he will go to Dawson, N. D., on the N. P. Railroad, he will not be disappointed, though he should not expect to get chickens, ducks and geese all at the same time, as the geese do not come down until later, and the best duck shooting is a little later than the best chicken shooting. I have also told him to write to Mr. J. J. Gokey, of Dawson, whom I know to be a good guide. It is safe to say that if Gokey takes out the party they will all be pleased. It seems odd to come from Maryland out to Dakota to have a duck shoot, but yet it is true that these gentlemen will be able to kill more canvasbacks in Dakota than they could around the Chesapeake country. I hope they may have a pleasant trip. I used to hear so much about Dawson that I was very unbelieving regarding it, on the usually safe grounds that a much-touted place is a good one to stay away from, but I was out there last fall and saw enough to convince me that it could show sport good enough for any man, and better than I had seen anywhere for many a long time.

Illinois Early Birds.

State Warden Loveday called at my office the other day, and he said that the state of affairs in regard to chicken law violations in Illinois this year can not be exaggerated in its bad features. He thinks that Judge Ramsey, of Whiteside county, has done the State an irreparable damage in his decision that the law was invalid, and that any who cared to could shoot after Aug. 15. In view of this advice, a big party of so-called sportsmen banded together at De Kalb, Ill., early in August, and declared that they would go out shooting on Aug. 15, and would defy and resist arrest. News of this came to Warden Loveday, and on Aug. 15 he was at De Kalb and drove all over the country thereabouts looking for the invasion of armed scoffers at the law. He had his trip for nothing. A recreant deputy —the same man who wrote saying he thought he ought to shoot ahead of the day if the "sports" did—gave the thing away, and not a shooter went out, so far as could be learned. Perhaps I need not add that that particular deputy is now serving his country in another channel of activity.

Warden Loveday has long been giving heed to the many complaints from Galesburg, where he was sure there was a local market for illegal birds. This week he ran down to Galesburg and "pulled" the warehouses of Weinberg Bros., at that city, and seized a shipment of birds just made ready for Chicago market. He has brought suit for $975 worth of fines against this firm, and has his eye on some others in that city.

It is a curious thing, in view of all the damage that Judge Ramsey, of Whiteside, has done—a damage greater than he will ever live long enough to make up to the people of Illinois—to learn that Judge Ramsey has changed his mind. He has revised his notion of the law, and has in effect reversed his own decision, though this time in private, and where it will not be so publicly known. State's Attorney Steger, of Sterling, was the means of converting Judge Ramsey. He went over the law with Judge Ramsey, and the latter freely admits that if he had to do it all over again he might look at it differently. So Warden Loveday advises me. This is curious news, but we might wish it had come to hand before the decision which sent out so many early and illegal guns in Illinois this year. It will be years before this thing can be corrected. You may pass a dozen new game laws, but a dozen years from now you will find fellows out shooting in July who will say they think they can shoot legally then, because Judge Ramsey said so. This is a sort of rule which never seems to work both ways.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

In Old-Time Wisconsin.

Editor Forest and Stream:

"My First Chicken Shoot" in the last issue of FOREST AND STREAM has waked my memory up on past delights, and now I think I'll see that man and go him one better.

Once on a time, when this world was younger than it is, and "me too," I lived in the wild and woolly West, and game was so plenty everywhere that it had to get out of the way to keep from being trodden on. I was in Madison, Wis., just before the big boom began, and everybody seemed to have nothing to do but try to sell lots at any price.

I had no lots to sell, but I had lots of time on my hands, which I principally used in feathered sport.

In some high meadow grass not far from town I killed sixteen woodcock one day, and I had some duck shooting that makes my mouth water even now. At the hotel table one day the subject was duck shooting, and a miller, whose mill was about a mile up the lake, remarked that ducks flew over his head into the lake nearly every evening as he came to supper.

That was thin enough for me to see through, but I "sawed wood" and said nothing, and the others failed to catch on. I was full enough of duck lore to known that they had been feeding down in the swamp and flew over into the lake to roost, and as he said they flew over the little bridge at the brook I was on that little bridge next evening with my dog and gun, and had not stood long before I saw a wood duck coming, and he was so tired that he fell. Then they kept coming one and two at a time till nearly dark, and not a single bird escaped.

Sometimes the second one would fall in the lake, but I had a fine retrieving setter, and every duck was piled up at my feet without my speaking a single word.

I have had shooting galore of nearly every kind, but I have always looked upon that as the most enjoyable bit of sport that ever fell to my lot.

But to the chickens—which are worthy of a wilder name. They were as thick as bees all over that part of the country then, and as they were so easily killed I cared very little for the sport of shooting them; but a farmer living some miles out was in town one day and fairly begged of us to go out and kill off some of the chickens, for they were so thick that they were destroying all his grain.

There was an English money-lender there who owned a good dog and was very fond of shooting, so we agreed to go on a slaughtering expedition next day. We found them as thick as meat in a mince pie, and as they were still in coveys four birds would fall at every rise for a while, but at last my English friend began to get a little tired or unsteady, and kept missing more and more, and ejaculated more damns than I could find use for. At last it came to pass that he swore "by the gre't horn spoon" that he wouldn't shoot at another bird till I had emptied both my barrels, the consequence of which was that I had nearly all the shooting to do from that time till the close.

I do not think our birds were counted, for we did not care enough about them to take that trouble, but we had a double team box "buggy" heaping full, and everybody whom we met in town got all he wanted after supplying the hotel.

How about the business up there now? Then it was grain preserves, and now it is game preserves, and the difference in conditions saved us from the charge of being game hogs.

DIDYMUS.

ST. AUGUSTINE, Aug. 22.

The Dead River Region.

REPORTS from the lower Dead River region of Maine indicate that the fishing during the summer has been unusually good, and that the number of visitors to the section has been very good. Big catches of trout have been made, and others are likely to be before the hunting season opens.

Ducks, rabbits and squirrels are now in season, and the ruffed grouse shooting opens Sept. 20. September is a good month to be in the Maine woods, on account of the small game shooting, and also because the fact that fishing is not yet over. If one stays a few days in October there is a chance of getting a deer.

Mr. J. G. Harlow writes us that in three days' travel not long ago he paddled an angler up to three big moose and forty deer, all of which were within good shooting distance. Besides this they caught 160 trout, most of which were returned to the water, though eight, which weighed 12lbs., were brought home, besides what the party ate.

It is thought that the prospects for big game are better than for some years.

Scotch Grouse Moors.

Here is a bit of shooting history, from the London Field, which has interest for us in this country, where, in lesser degree, a like development is taking place:

The student of shooting history may perhaps at times feel inclined to look back with regret to the time when King William IV. sat upon the English throne, as in those days grouse shooting, apart from the cost of travel, was a cheap amusement indeed; for it was so little sought after about seventy years ago that most landowners in Scotland kept it in their own hands, and scarcely ever dreamed of attempting to find a shooting tenant. They regarded grouse as indigenous to the ground, just as a man with a pond would expect to find fish in it; and, finding the grouse there, they shot them, without thinking that any southerner would ever bid a fancy rent for the privilege of walking the moors; and when moors were first let the sum demanded for the shooting was moderate in extreme—so moderate, indeed, that there is no room to doubt the smallness of the sum really laid the foundation of the popularity of grouse shooting. It could originally be enjoyed at so moderate a cost that many people, perhaps, scarcely noticed the gradual rise in rents, in their zeal to find pastures new. Nor need we feel any surprise. To the hunting man a change from one country to another may bring with it merely an alteration in the nature of its fences; but to go from one quarter of England to another, save in a very few cases, means but little; though to pass from the well-tilled lands of the south to the wild hills of the north is a change which anyone can appreciate. At the present, as in past time, a goodly number of the moors in Scotland are in the hands of those who have a connection with the north country; but as years have rolled on more and more southerners have taken shootings north of the Tweed, until at the present day grouse shooting, like golf, may be said to be invaded by those who aforetime were absolute strangers to both forms of amusement. It was about fifty years ago, perhaps, that to have a moor in Scotland became one of the ambitions of life, and many a Scottish landowner must have since thanked his stars that it was so, for the southerner has put many a thousand pounds into the pocket of the northerner. As, however, the rent of shootings has increased, so has the class of tenants become more limited, until at the present day a very great number of those who are to be found on the moors in August and September are those upon whom fortune has smiled in commercial and financial circles. The English squire, it need hardly be said, who is often but too anxious to let his own shooting, is in no hurry to hire that of some one else. Nevertheless those who can afford the luxury find a shooting expedition to the north a holiday after their own heart. The invigorating air, the exercise, the novel surroundings, the comparative simplicity of life at the lodge, one and all contribute their share to the enjoyments of grouse shooting.

Maine Partridges.

Boston, Aug. 29.—The legal Maine partridge season opens Sept. 15, but if reports are true, many of the birds will have fallen into hunters' bags before that time. Vacationists are already in that State in great numbers, armed with shotguns, and some of them declare that they shall shoot "enough partridges to eat; law or no law." Not every gunner will do this, it is true, and that makes it all the more unjust and unfair for others to shoot partridges before the open season begins. The indications for partridge shooting in that State this fall are poor as a whole, though some sections are reported to have some birds. In the vicinity of Round Mountain Lake and about Alder Steam fishermen and vacationists report that they have seen a good many partridges. The same reports also come from the Seven Pond section. Other observing sportsmen, who have been through the Megantic preserve several times this season, say that they saw a good many broods of partridges. At the Middle Dam, Rangeley Lakes, a fair supply of partridges is also reported. Men who ought to know say that they have seen a good many woodcock there this season, and especially on the Buckboard road to Sunday Cove. A few woodcock were taken at the Middle Dam a number of years ago, but these last reports are all that has been heard of such game birds there since. In Lower Oxford county, where partridge shooting was good a few years ago, there are only a very few. Some of the Androscoggin county gunners are looking for fair partridge shooting a few miles out of Lewiston, and a good flight of woodcock is looked for by Farmington gunners. In the vicinity of Bridgton woodcock are also reported to be fairly plenty. I have carefully questioned returning rod and reel sportsmen, and at other than the above places very few partridges have been noticed. There is a feeling that this splendid game bird is doomed in Maine, and the most stringent legislation, or rather enforcement of legislation, is urged, before it is too late.

Special.

Trapping Coons.

Claremont, N. H., Aug. 20.—You tell that man or person who wrote in Fur Trade Review that the only way to trap a coon was under water, that he is way off, for I saw a coon trapped by setting a steel trap right close to a turkey's nest containing eggs, on the side of Sunnapee Mountain. The trap was only concealed by the brakes surrounding the nest. The coon had been in the habit of robbing the nest, so the turkey was confined, some eggs placed in the nest, and the trap was set close by, and the next morning the coon was in it.

Columbia.

Shore Birds on Virginia Coast.

Chincoteague Island, Va., Aug. 22.—*Editor Forest and Stream:* Bay birds were never so plentiful on the meadows and sands of Chincoteague and the neighboring Virginia coast as now. Gunners here are getting 40 to 100 to the man each day. Yellowlegs are the principal sorts large and small; there are some willets.

T. G. E.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in Forest and Stream.

Where to go.

One important, useful and considerable part of the Forest and Stream's service to the sportsmen's community is the information given inquirers for shooting and fishing resorts. We make it our business to know where to send the sportsman for large or small game, or in quest of his favorite fish, and this knowledge is freely imparted on request.

On the other hand, we are constantly seeking information of this character for the benefit of our patrons, and we invite sportsmen, hotel proprietors and others to communicate to us whatever may be of advantage to the sportsman tourist.

Rod and Pole, Fly and Bait.

Marshall, Mich., Aug. 10.—*Editor Forest and Stream:* For the past two or three summers I had been writing to my brother in New York, telling him of the wonderful bass fishing here in this district, of my great catches, etc. I was trying to persuade him to pay us a visit and at the same time to drop a line to the bass. He never took any notice of my letters, but always went up in Maine for his outing, and never refrained from mentioning the fact that he always used flies to make his killing with.

This summer he fished in Michigan waters, and now swears by them. A letter, telling me he would be there on Friday, put me in excellent spirits, and gave me ample time to put my tackle in condition. A pole (not a rod) was all I had, and I never fished with anything different. Awaiting his coming, my mind wandered back to the times when we used to fish the Kalamazoo, when we were both youngsters. I pictured again and again the trips we used to take down the river, he with his 18ft. 6in. cane pole, casting this way and that, and as soon as a bass struck the hook it was jerked in the air 36ft. above water before it knew it. He always was proud of the fact that he owned the longest pole, and used to brag over it. But I was not to be outdone this time, for I had a 20-footer, the longest I could buy in Marshall. It kind of worried me for fear he would bring a longer one from the city, and still be ahead of me. I even went and bought a dozen bass hooks, on snells, not that I ever used them, but more to make him envious.

Well, he landed in Marshall at last, and as he stepped from the train my heart sank. He had no pole, and was dressed altogether too dudishly to go on a fishing excursion. Timidly I asked him where his pole was, and he said in his tackle bag. It began to dawn upon me that here was one of those New York fishermen one reads about, but the like of which we in our district had never seen. I could hardly wait until I got him home, so anxious was I to see that outfit—the tackle of a city sportsman who had been away up in Maine. Arriving at the house, and after greetings all around, he opened the box. Well, sir, he had rods and reels galore, casting spoons by the dozen and lines by the hundreds. He also had what he termed flies, that nobody in this world ever saw in real life, and a few bugs that looked as though they would bite the fish instead of the fish biting them. Right there and then I said to myself, if ever he drops one of those ugly-looking bugs in front of a bass in these waters, the bass would kill himself getting away. He talked unceasingly of Seth Greens, dusty millers and hackles, coachmen, etc., until my brain was in a whirl trying to remember all he said, and I was glad when mother said he had "flymania." He quieted down, and asked me where our first trip was to be. I told him the following morning at sunrise would tell, to follow me and I would run him over the finest bass grounds in southern Michigan, on the Kalamazoo River, a five-mile trip by boat, drifting with the current to a place called Wheatfield Dam, with plenty of good fishing from beginning to end.

The evening quickly passed, and we retired to our respective rooms. Sleep was out of the question with me. There were flies and bugs, rods and reels, leaders and hooks, all mixed up in a confused mass, constantly appearing before me. The crowing of a rooster under my window told me it was time to rise, and never had I appreciated that rooster's voice until that morn. I was up and dressed in just about three minutes. Crossing the hall, I knocked softly on Gene's door. No response. Knocking still harder, I heard a muffled voice, "Well, what is it?" "Come on, Gene; we're late now." He said: "Great Scott! Why don't you start in the middle of the night?" and rolled over for another nap. But I kept at him, and after we had had a cup of coffee, we started.

A brisk walk brought us to the boat. Leaving him there I went below to my minnow box, and took out about seventy or eighty nice chubs. They were for my own use, for at starting he refused even to look at a minnow. He tried to convince me that it was a waste of time fussing with minnows, as he could catch all we could use with his flies. But I knew the bass in the Kalamazoo River were plain livers, and would hesitate to tackle anything that looked as delicate as his flies.

Getting everything in readiness, I gave him the position in the bow of the boat facing down stream, so that he could command both sides and straight ahead. I was crazy to know how these flies worked, and did not intend to do any fishing myself except at times when we were anchored. The sun had just begun to show itself as we pushed off and started. Waiting until we got fairly in the center of the stream, he began "working his line out," as he called it; and the way I was kept busy dodging that bunch of flies would have done credit to a professional dodger. We were drifting very slowly now, and he was casting this way and that; and in a back cast he made his first catch, on a basswood limb about 10ft. above water. Really, I was glad of it, as I was disgusted with those flies and his city fixin's. I asked him if he was trying to catch a bird. He muttered something in an undertone; I think any fisherman ever placed in the same position can guess what it was. He made no attempt to get them, but cut the line as far up as he could reach.

We had already passed over some excellent bass grounds, and I was convinced that those flies wouldn't work in these waters. I wanted him to try a minnow, but he said he would be smoked if he would. So he made up a lovely collection of curious and gaudy flies, topping them off with a bug. I can't recall the name of that bug now, but it was a daisy. Starting again, he cast here and there, but got never a strike. Getting discouraged, he said there never was a bass in water that refused that bug. I said they were not so foolish as to bite such a looking thing, and that if he would only try a chub and hook him as I directed he would get a strike before we had gone 50ft. But no; he hadn't fished with live bait in years, and wasn't going to begin now; said I blowed so much, etc., and finally, "You take that flag pole of yours and see what you can do."

I was only too glad of the chance. I wanted to show him that there were bass in plenty, and to convince him that his city outfit was no good compared with my own spear pole. Changing places with him, I selected a fair sized chub; and never was I so careful as how I hooked him. I put the hook down through his mouth, out through his gills, and twisted the hook around and inserted it so the point came out directly in the middle of his body. A minnow hooked thus will always keep a horizontal position in the swiftest running waters, and it is very seldom a fish strikes and gets away.

Glancing ahead a few feet, I saw a likely place for bass—an overhanging bush, partly in the water, whose branches had caught a small amount of driftwood, etc., the outer edge of which was covered with foam. I knew there was a bass under that foam waiting for his breakfast; something about the waters seemed to tell me so. I could almost see him, so certain was I. The mystic information proved correct. I pointed the spot out to Gene and said: "Watch the professor."

Getting a firm grip on my pole, I measured the distance and dropped the minnow near the edge of the foam, and dangerously near the driftwood. There was a rush, a splash, and a bass swinging in the air before Gene could recover his surprise to exclaim, "Well, I'm smoked."

He certainly was disgusted the way I yanked that bass out of water; said I was a "killer," and I never ought to do that, but play them, give them a show, etc. I knew he was right, and felt ashamed of my action, but couldn't help it. Anybody who was brought up to use a cane pole, and was always taught to get them in the quickest way possible, you can't blame much; for a man brought up thus would endeavor to throw a 6lb. bass in the air, just as he would a sunfish.

I caught two or three more bass in the same way, and finally persuaded Gene to put up his flies and try minnows. Reluctantly he put on a chub, whose weight alone made his little rod bend almost double, and made two or three casts, until finally he said, "Ah, there, at last!" I could see his reel gradually unwind, slowly at first, but with increasing swiftness, until I could stand it no longer, and yelled: "Pull up!" He immediately set the hook in him, and the fun began. There was a sudden stop as he set the hook, then a rush that made the reel scream. It was a great fight.

Several times the bass broke water, and as many times I said, "He's gone!" only to see him start again on one of his famous rushes. Gene got so excited that he yelled, "Say, Bob, this beats fly-fishing all hollow." After a couple more of rushes the fish was gradually reeled up to the boat; then did we appreciate its size, a bass of 4½lbs., which evidently had been through the war, as it had several scars on the body, and part of the tail was gone. As it lay there in the bottom of the boat, too tired to flop, it certainly did look like an old warrior. It was the picture of defiance, every fin erect and an ugly look in its eye.

On our trip Gene alone caught twenty-eight bass, but his first was the largest. One thing I was satisfied with that I had converted him to using live bait and I was trying to convince him that a cane pole was the best, but he swore by his jointed rods. A farmer acquaintance I was relating our experience to remarked: "No use talking to those cute New York chaps; it's only a waste of air."

Later I will describe a trip to a small lake, called by the few farmers near the locality "The Pork Barrel."

Van.

Trouting in the Pecos.

Glorieta, New Mexico, Aug. 9.—*Editor Forest and Stream:* During the past month I have been fishing for trout in New Mexico, along the line of the Santa Fe road. Mr. Edward B. Linnen and Geo. Cross, both of Santa Fe, were my companions, and we have had sport enough to satisfy most trout anglers. We fished the streams in the vicinity of Glorieta, New Mexico, which is on the Santa Fe road, about twenty-seven miles distant from Santa Fe. About eleven good streams can be reached, by train, in from one-half to a day's drive from Glorieta.

We preferred to fish the Pecos River, and its head water, the Mora River, which in our opinion contains more trout than any other stream in America. From Glorieta to the mouth of the Mora River is about twenty-five miles, and from Strong's ranch, seven miles from Glorieta, to the head of Mora River is about forty miles, and the best forty miles of good trout fishing, I venture to say, in the country. The Pecos and Mora rivers are just wide enough for fly-casting, both streams having a hard bed of intermingled sand and rock, with a swift current, making numerous sharp bends, and each stream contains countless deep pools and riffles. The deep pools are the abiding places of the larger trout, some from 1 to 3lbs., while the riffles and edges of the deep pools are alive with smaller trout, ranging from 6 to 10in. in size. We used a small brown fly—a sort of hackle—and a royal coachman fly with best success.

In fishing the Mora, or upper branch of the Pecos River, we fish up stream, casting the flies upon the surface of the numerous pools, or "pockets," formed by water dashing over immense rocks, sweeping out sand

gravel and smaller rocks, and in these pools the trout seemed to fairly swarm. Two and three trout at a cast was a common occurrence, the flies would sometimes be taken before they reached the water. Two of us fished from 7 A. M. until 3 P. M., and took 467 trout, ranging from 6 to 15in. in size.

I generally fish with a short line, 5ft. leader, and cast the fly over the pool several times in quick succession before allowing it to alight, then I allow my fly to touch the surface of the water lightly several times, always keeping the leader and line from striking the water. After repeating this performance a number of times, I allow my fly to alight on the water, always a few feet up stream from the point where my previous casts have been made (as described by Mr. E. Hough in the edition of May 28 of FOREST AND STREAM), and allow the fly to drift slowly down stream, thus it passes over the previously agitated water, and this is the most killing way to fish for large trout. I evolved this style of fly-fishing from a long and careful study of "dry fly-casting," and have tried it on hundreds of trout streams throughout the country, with the same results, always catching large trout by this method of fishing.

Several men from St. Louis, Mo., were fishing on the lower Pecos River, and they had many trout ranging from 6 to 8in. each. I asked them why they did not catch some larger trout, and one of them replied: "The trout seem to run small in this part of the river."

"I can soon convince you that the trout run much larger than you gentlemen have been catching," I replied.

They laughed, and I began to make a number of 'crazy casts," as they termed them; in a few minutes I hooked a large trout, and secured four trout from a pool which had been whipped, not more than ten minutes before, by these men. Then these doubters began to try to imitate my new style of casting, and they would slap line, leader and flies violently upon the surface of the water, which was a most comical and amusing sight. For this style of casting cannot be learned in a day. I have been five years studying and mastering it, and here four men were expecting to learn it in a minute. But artistic fly-casting surely brings good results, and cannot be acquired only by long and careful practice.

We go to fish the Rio Grande River, in Colorado, in a few days, and I will write about those waters later.

EDWARD G. TAYLOR.

Canadian Salmon Rivers.

NEW YORK, Aug. 22.—*Editor Forest and Stream:* Referring to the letter concerning salmon, anglers are beginning to send me more detailed information in relation to the poaching in particular rivers, as I had hoped would be the case. And as the facts are furnished in relation to each river, I have begun forwarding them in the shape of separate letters to the Fishery Bureau of the Crown Lands Department.

The record shows, as was anticipated, a frightful neglect of what might be a very valuable asset of the Province of Quebec, and incidentally of the States of Maine and New York, since Lake Champlain and its discharge into the St. Lawrence were once prolific of salmon; as also, curiously enough, the interior waters of this State—every river of any size which communicates with Lake Ontario and the lakes from which they run being formerly stocked with salmon. I suppose that it would astonish many of your readers to know that with decent protection of salmon in Canada (and also, of course, necessarily here in the State of New York), the St. Regis, Raquette, Grass and Oswegatchie rivers in St. Lawrence county, the Black River in Jefferson county, the Oswego in the county of the same name, and the Genesee in Monroe county, would all again be salmon streams. Canada does not now allow any salmon to get as far as Lake Ontario; if she did they would be in all these rivers, and in such lakes as these rivers communicate with (provided there be no impassable falls—say anything over 14ft. of clear drop). So you see that we are incidentally interested in the preservation of the Canadian salmon. Of course, mill dams in the rivers I have mentioned would need fishways. However, this is somewhat beside the particular matter which I intended to ask you. I enclose you a copy of a letter to Mr. Joncas (referred to above), containing information which has been supplied to me as to one river; and if you think that its publication, as a sample of the class of information which is desired, and an evidence to others that some anglers are taking sufficient interest to supply the facts, would assist toward the general result, I should be glad to have you print it.

CHAS. STEWART DAVISON.

Aug. 19.—L. Z. Joncas, Esq., Superintendent Bureau of Fisheries and Game, Department of Crown Lands, Forests and Fisheries, Quebec, Canada.—My Dear Sir: Referring to my letter to you of the 16th of August, giving you the details of the illegal netting and poaching during 1896, 1897 and 1898, in the Olomanosheebo, with as a resultant the complete ruining of that river, I now have to lay before you the facts in relation to another river in the vicinty of the former.

The Washeecootai. This river was visited by an angler in 1896 who arrived there on the 16th of July.

On that date there were five salmon nets in the estuary.

The statement is confidently made to me that but two of these nets could be lawfully set.

Of these five nets four were set in pairs opposite each other from the two sides of the estuary, at its narrowest portions.

The four nets were so set in pairs opposite each other as to reduce the distance between the ends of the nets to certainly not more than 150ft.

The fifth net was set just below the first falls from the east bank, entirely obstructing the only channel which, from the general configuration of the river and falls, was available to salmon for ascending.

These five nets were in charge of Placide Blais, of Romaine, who was employed to tend them by Michaud Blais and Adolphe Guilinette, both of Romaine. Placide stated that in his opinion the upper net was so placed as to catch every salmon which sought to enter the upper waters of the river. Appearances seeming to bear out this statement, the angler paid him a sum of money to remove this net.

A careful examination being made of the pools in the river, abundant evidence of poachers was found there in the presence of stakes and suitable boulders arranged upon either side of each pool between the first and second falls, and each between the second and third falls, bearing silent testimony to their use for the attachment of nets at these several points on the river bank; also stones were found with the cords still attached to them, which had been used to weight the lower edge of the nets, the current being somewhat swift in places.

Inquiry developed the fact that the people from more easterly rivers, notably from the Kegashka, were in the habit of netting the pools of the Washeecootai every season.

The exact method of arranging the nets in each pool was explained by one Antoine, who came there from Musquarro, while the angler was on the river. Placide Blais stated (in 1897) that during this season (1896) the nets at the mouth took in all eight barrels.

1897. The same angler again visited the Washeecootai in the year 1897. On that visit he was informed by Mr. William Forman, of Kegashka, whom he met at Romaine, that the day after his departure in 1896 the river was visited by whites from Musquarro, who took eight barrels of salmon from the pools. Mr. Forman saw a pile of salmon roes upon the rocks when he came there on the day following (being the second day after the angler's departure), and they were so fresh that he cooked some of them for his supper. Mr. Forman did not state the object of his own visit to the river.

Early in 1897, intending to visit the river, this angler paid Michaud Blais and Adolphe Guilinette what he described as "an exorbitant price" not to net the estuary until after he had finished angling. He arrived on the 15th of July, and on his arrival there were no nets in the estuary, but the agreement did not appear to have been respected, or else others had illegally netted the estuary, for he found evidences of recent netting along the banks of the estuary, and many of the fish already in the pools at the time of his arrival bore net marks.

The river, however, is a late river, and most of the fish enter it even after July 15 or so, it is stated, so there was probably not very much netting in 1897 (at least until after he left), and yet fish were less numerous in the pools than during the previous season.

1898. The Mr. McLoughlin who visited the Olomanosheebo in 1898 also visited this river the same season with his friends, and states that he found all five of the nets above referred to in operation, but that only three and a half barrels of salmon were taken during this season.

Mr. McLoughlin further stated that the pools in 1898 were almost empty of fish, the angling in the river amounting to nothing.

The river may be therefore looked upon as now substantially depleted, and it needs rigid protection for several years to restore and maintain its character as a salmon river. Should this be afforded to it by the Provincial Government, it would be in the future, as heretofore it might have been, a valuable asset for the Province.

The characteristics of the river are such that it can be readily guarded by one honest man. The mouth of the river is uninhabited. All the pools are within sight from the first falls, and a daily visit to the estuary (involving a row or sail of about six miles each way) would be enough to insure the protection of the river.

The suggestion is further made in relation to this, as all other rivers, that the guardians should be strangers, not local residents. CHAS. STEWART DAVISON.

NEW YORK, Aug. 25.—Charles Stewart Davison, Esq.—Dear Mr. Davison: Your very interesting letter in the FOREST AND STREAM upon the necessity of doing something to protect the salmon in Canadian waters recalls to my recollection how twenty-five years ago, spending a summer on Penobscot Bay, I used to go out with a neighboring fisherman to visit his salmon pond. I believe we never returned empty handed, and usually with several fine fish. This trip was made twice a day at each low tide; and so far as I can remember every house along the shore had a salmon net running out into the river in front of it, and a smoke house near the water edge to cure the fish. All this is now changed, I am told, and the dwellers along Penobscot Bay have to do without the salmon their short-sighted predecessors enjoyed. The man that killed the goose that laid the golden egg was fired with a laudable desire to make a scientific investigation, yet he has been held up to ridicule and contempt for all succeeding generations. But the Canadians have no such excuse in the case of the salmon. They have seen the process of extermination carried through all its stages in this country, and it requires no great intellectual development to comprehend what the result of leaving things as they are must be. In this country we have exterminated the beaver and many other fur-bearing animals. We have cleared our forests away to the extent of seriously affecting our climate in many places. Our Canadian neighbors insist upon exterminating the seals. Why should we continue to multiply instances of folly, to build monuments to our inability to do what we clearly see ought to be done. If it is worth while to found libraries and colleges, and to tax ourselves for the protection of infant industries in order that posterity may enjoy the fruits of our self-sacrifice, why not devote a little sense and effort to preserving what nature offers to cast up to us out of the sea for all time, if we but enforce a few simple police regulations, entailing no greater restraint on present enjoyment than is shown by the farmer when he saves enough from his crop to plant the next one, and prevents his neighbor's cattle from trampling it down while it grows. If you are successful in your effort to induce the Canadian authorities to take up this matter, which they have so long neglected, you will have repaid to the waters a thousand fold for each fish your rod and fly have taken from them. Very truly yours.

HENRY DE FOREST BALDWIN.

The Towing Tuna.

AVALON, Santa Catalina Island, Cal.—*Editor Forest and Stream:* In a late issue of FOREST AND STREAM, Mr. Houston, of Aransas Pass, expresses a desire to know the line used at Santa Catalina, where boats are towed by the tuna against the oars of the boatman, as described in my letter in your issue of July 2. It is called a yellowtail line, but is a 21-thread cuttyhunk line. The line I used was a 21-thread cuttyhunk, and I had 900ft. on the reel. In my experience the 21-thread is more satisfactory than the 24-thread. I do not know the name of the manufacturer, but whoever he is, I give him the credit of making a remarkable line. Many fine lines and so-called tarpon lines, costing more money, which have been brought here, have failed on the tuna.

Mr. Houston's lines break possibly because his boatman fails to get the boat under way. In our fishing, if towing behind a launch, the boatman has his oars ready, and at the strike casts off the painter, seizes his oars, which are in the row locks, and backs water violently, so that (if he understands his business) the boat has good stern way by the time the fish has taken 200 or 300ft. of line. If this is not accomplished, the line breaks at once, or is entirely unreeled. After or between its furious rushes, when, of course, nothing can stop it, and the angler merely plies his brake, the tuna is always towing the boat; the boatman, by holding his oars overboard or fixed in the water and pulling carefully against the fish at times, thus aiding in stopping it from going out to sea. The line mentioned is quite equal to this if it is carefully watched. If the line is dry on the reel, it will burn off; if it is knotted, it will saw off; if it is held in one position, it will chafe off at the tip of the rod.

When Mr. C. R. Scudder, of St. Louis, had played a tuna four hours, and both oarsman and angler were weary, I was put aboard their boat from Mr. E. L. Doran's yacht Narod, and took the oars from Jim Gardner, and served as boatman for three hours longer. I was constantly engaged in keeping the stern of the boat to the fish, and held my oars on the water all the time to prevent the fish from towing us further off shore, as a heavy sea had picked up and we were out of sight of Avalon, six or seven—perhaps eight—miles off shore. The fish had been hooked within 200yds. of the island early in the morning, and seven hours later I suggested that as the fish would evidently tow us all night, and Mr. Scudder had done his whole duty on the premises, that we end it. It was impossible at this time to move the fish, which was in a fit of the sulks; so Gardner took the line in his fingers and lifted gently hand over hand for possibly 100ft., in this way bringing the fish, which was found to be foully hooked, within reach of the gaff. When the tuna was taken in it hammered the boat in a manner that suggested that we had caught a tartar. So far as we could judge, the fish was as strong as at first. It was estimated that he had towed the boat twenty miles, and I believe he would have towed it twenty more.

In my catch of a fairly hooked 183lb. tuna I could see no difference between the last rush, when it shattered the gaff, and the first. The fish was no doubt weaker, but it certainly seemed to me that it gained in strength as the fight went on. I was so interested—indeed fascinated—by the tactics of the fish that I did not notice the sea, but at the finish, when the fish was towing the heavy yawl against the sea, Gardner, my boatman, who was doing his best to stop the run with his oars, told me that he expected every moment to see a sea come in over the stern and fill the boat, yet the boat, with two men (a heavy, wide-beamed yawl at that), was being towed at a good pace, the two launches following—the trace of this active steed being a 21-thread cuttyhunk. I believe this is the experience of the twenty-four members of the Santa Catalina Leaping Tuna Club—that is, each one has been towed by the tuna against the oars of the boatman, who is not, of course, rowing desperately against the fish, but backing water, and holding the oars and rowing carefully, as occasion offers, against the fish.

CHAS. F. HOLDER.

Maine Fishing.

BOSTON, Aug. 26.—There are yet some good reports of black bass fishing in Maine. The weather was dry and excessively warm during July and early August, but since that time abundant rains in some sections have evidently set the bass to rising. Many good catches have been made from the ponds in Sabatis, but mostly by Maine fishermen. The new electric railroad from Bath to Lewiston passes those ponds, while the steamers run from Boston to Bath almost daily.

The Belgrade ponds are affording a great deal of sport for the bass fishermen this season, and the season is holding out wonderfully. There is a little steam launch on the best of those ponds, that takes out the fishermen daily, from Belgrade Mills. Some days a week ago she took out fifteen boats at a time, with the parties to fish from them. At nightfall she picks up the fishermen—frequently fisherwomen this season. One lady, a Mrs. Clark, has become a good deal of an expert at fly-casting for black bass. She tells a good story in one of the Maine papers about the sport of one day. The little steamer took twelve boats out to the fishing grounds that morning. Soon the sport began. Very frequently the fishermen had on doubles. Twice in succession Mrs. Clark landed doubles. At one time she counted nine fish hooked and being landed, and nearly all the time somebody was unhooking a fish and throwing him back, or into the tub to be cooked.

It is sad to chronicle the passing away of a fisherman, but all too often it comes. Henry C. Sanderson, of Brighton, passed over the Great River on Wednesday. Though only twenty-four years of age, he had acquired a great love for angling, and visited Belgrade ponds every season. The love of fly-casting had become almost a passion with him. Studious and scholarly, he was a great lover of angling literature, and particularly the FOREST AND STREAM.

SPECIAL.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

How to Distinguish Fishes.

BY FRED MATHER.

The average angler knows by sight all the fish which he captures, but ask him to describe one and he is puzzled, and will get off on the color of the fish, which is of the least value of all its points. Some time ago a letter came from Sullivan county, N. Y., saying: "We have a fish in our streams which we call whitefish; it grows to a length of 8 or 10in., and is dark on the back and light on the belly; can you tell us what it really is?" As the description will fit a catfish, an eel or a black bass, I gave it up. I asked the man if the fish had hard or soft fins, scales, and other questions, but he "hadn't noticed." This habit of not noticing is very common. Not one angler in a hundred can tell you how many fins a black bass or a yellow perch has on its back, yet he knows the fishes well by sight.

In this article there is no intention to dip deeply into ichthyology and to delve in the mysteries of pyloric appendages, gill rakers and pharyngeal teeth, which only dissection can show, but merely to map out the salient points on the outside of our angling fishes, so that they will present themselves as prominent features in determining species or in describing a fish which is strange to the one who captures it. Such a smattering of fish lore is not hard to acquire. Every boy knows a dog from a cat, but few of them could describe the differences so that a person who had not seen either one of the animals could distinguish them. I would like to ask 100 bright boys of about fifteen years to write out the differences between the dog and cat, and see how many noted the shape of the pupil, the retractability of the claws, and other differences. This would illustrate how careless we are apt to be with familiar things, and the vast majority of anglers are as careless in their notice of fishes. Give them a name for a fish and they think they know the fish. The elder Agassiz once said: "Never mind the name of a fish until you have studied it and know what it is." He meant the peculiarities of its structure, and its resemblance to and difference from forms nearly allied.

I had fished from early boyhood, and knew as little of the fishes which I caught as do most anglers—merely a name, nothing more. I was over forty years old when Dr. Theodore Gill, Ichthyologist of the Smithsonian Institution, asked me if I had ever noticed any variation in the teeth on the vomer among the trout in my ponds. I truthfully answered that I had not, for I did not know what the vomer was, and never had paid attention to the teeth of trout. But as he talked my wonder grew. Here was a man who knew all about fins and a hundred other parts of fishes which I had never heard of, and I vowed to look these things up. I had all the instincts of a naturalist, but had never met a trained one before. I studied, bought books, and studied fish until I got where I knew something of the subject, and a fascinating one it was, not that I ever hoped to become a prominent ichthyologist, my collateral education was too deficient for that, for a man needs to be learned in the anatomy of all vertebrates before he can rank high in any department of zoology. Yet I learned something, and the pleasure it brought was worth more than the cost.

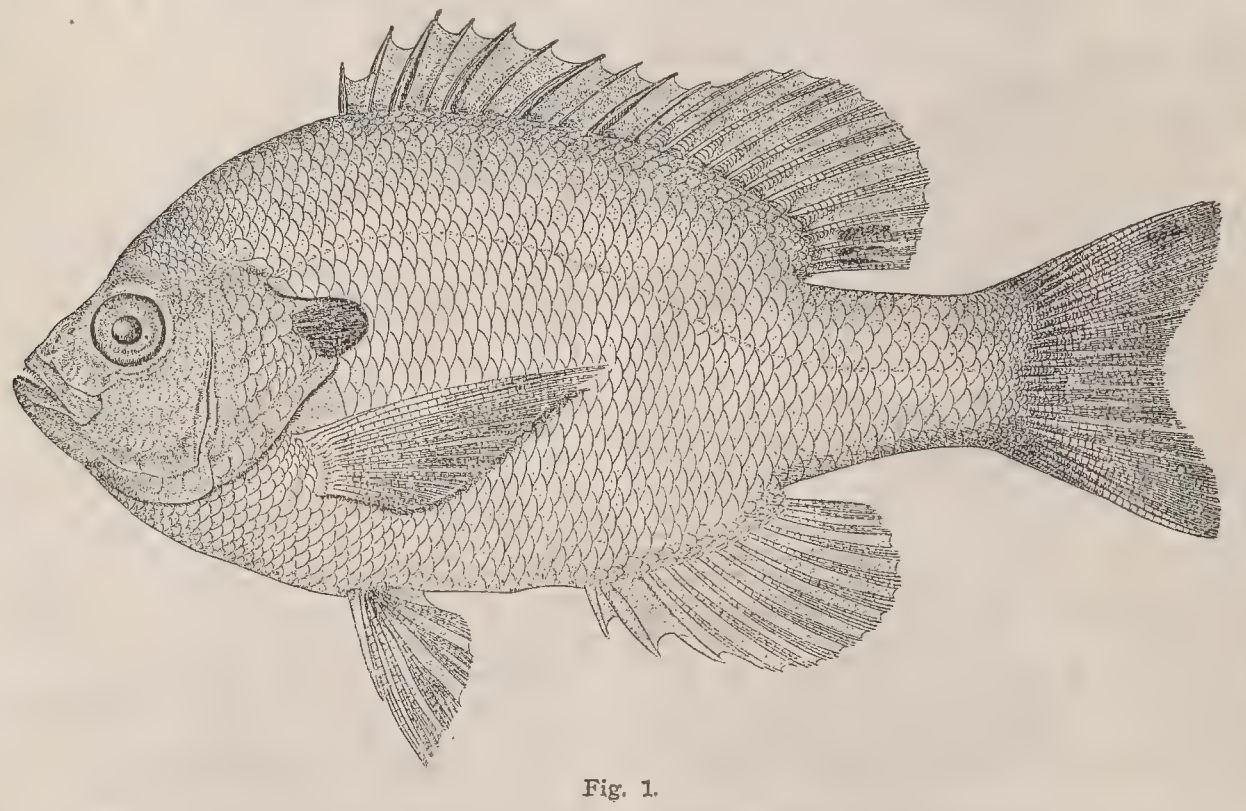

Fig. 1.

An outside view of a fish reveals several things of value in classifying it. These are: General shape, body elongated, compressed or round; length of head as compared to body. "Head, 5," means that the length of the head is one-fifth of the body. Fins, number and character, as spiny or soft; and scales, whether on head, cheeks or body, and their size as shown by the number in the lateral line.

Fins.

To begin with, we may divide fishes into two classes—those which have hard or spiny rays and those whose fins are soft. All the soft-rayed fishes have the first ray of their fins more or less stout, or even spiny, as in the catfishes, where the first rays of the pectoral and dorsal fins are very hard and thorny; yet the catties, bullheads, etc., are soft-rayed fish. The trout, suckers, chubs and others are soft-rayed, but the first spine on all the fins is stout, but not sharp, while the caudal has several short hard rays on the upper and under sides.

Pectoral Fins.

The pectoral fins take their name from the breast and are found on each side just back of the gill opening. These and the ventrals are often spoken of as the "paired fins," being on opposite sides, while all others are vertical. This is the case with even the flat fishes of salt water—flounders, flukes, etc.—for they are flattened laterally, as the sunfishes are, but they lie upon one side. The pectoral fins are always soft, but they vary in shape from the short ones, as in the eel, to the long pointed ones of the salt-water sheepshead. The number of rays in the pectorals are usually given, but they do not vary in different families as much as the rays in other fins do.

Dorsal Fins.

Dorsal fins, from Latin *dorsum*, the back: They may be single, double, triple, or compound. The single fin, if soft, has a certain number of rays which must be noted, also its position and height. By position is meant

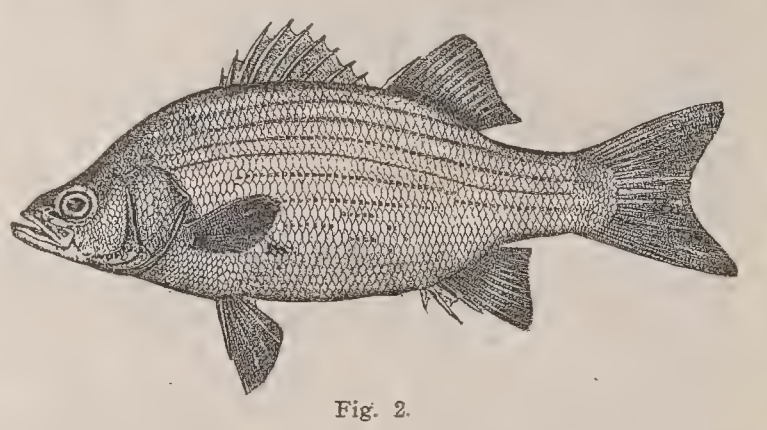

Fig. 2.

whether well forward, median or back. The dorsal fin of a trout is nearly central, while that of a pike or a pickerel is placed far back. In Fig. 4 we see the little adipose dorsal fin which marks the salmonidæ. A drawing of the fish will help to identify it, with description.

The single "compound" dorsal fin is shown in Fig. 1. It contains both hard and soft fins. To describe such a fin Roman numerals are used for the spiny rays and Arabac for the soft ones, and it would be written thus: D. VII., 15, supposing that to be the correct number.

Fig. 2 represents two separate dorsal fins, one hard and one soft. Remembering that there is usually one hard spine in a soft fin, the formula of the dorsal fins of our common yellow perch is D. XIII.—1, 14; that represents thirteen spines in the first dorsal and one in the second, followed by fourteen soft rays.

Fig. 3 shows a codfish which is rich in fins. It has three soft dorsals and two soft anal fins, as well as a barbel under the lower jaw.

Ventral Fins.

Ventral fins are named from L. *venter*, the belly, and not from English "vent"; this is a constant source of error. If the pectorals are homologous with the forelegs of quadrupeds, the ventrals bear the same relation to the hindlegs. Their functions, however, are not analogous. These fins are always paired when present; they are absent in the eel, hence that fish is the family *Apodal*, or "footless." But note how inconstant nature has been in placing these limbs on the different families of fishes.

Note the ventral fins on Fig. 4, the whitefish and one of the salmonidæ, which includes trout, grayling and others. Here we find the ventral (belly) fins in the middle of the fish, where it will be found on most soft-finned fishes; I say most, because in the soft-finned codfish, Fig. 3, the ventrals are thoracic, or on the thorax and in advance of the pectorals.

Then see the position of the ventral fins in the bass-like fishes, Figs. 1 and 2. In Fig. 4 the dorsal and ventral fins are near the middle of the body, and are attached to a bony plate in what is called the "dermal skeleton." This is readily cut out because there is no connection with the true skeleton, but with the perch and the bass-like forms these fins are joined to the shoulder-girdle; that hard bone which extends from the upper part of the head down and back of the gill opening. All the spiny-rayed fishes have the ventrals thus placed. Note the number of rays.

The Anal Fin.

This is named from the anus, or vent, and is always behind it. The cod and its relatives usually have two anal fins, some having but one, as the ling, cusk and hake. This fin may have several spiny rays or may be soft. If it has hard rays they are recorded, as in the dorsal fin.

The Caudal Fin.

Anglers usually miscall this the "tail," but the true tail is the fleshy part between the anal fin and this tail fin, which the densely scientific fellows know by the clumsy name of "caudal peduncle." Again, the angler wrongly includes the caudal fin in the length of his fish, but it has no more right to be so included than have the dorsal and anal fins the right to be considered in measuring the depth of a fish. The rays in the caudal fin are difficult to count; they have so many small ones on the edges, and branch so, that it is not necessary to enumerate them; but the shape should be considered, whether deeply forked, as in Fig. 4; slightly forked or square.

This fin formula is not at all difficult to learn. After the names of the fins are learned it is easy to see if there is more than one dorsal fin and its character.

The Lateral Line.

This is a line, usually well defined, running on each side of the fish; it may be straight, as in Fig. 4, or curved as in Fig. 1. This should be noted.

The lateral line gives us the size of the scales, an important point to know. For instance, the big-mouth black bass has larger scales than its brother, there being only sixty-eight scales in its lateral line, while the other has from seventy-two to seventy-five. This seems a slight difference on paper, but with the two fish of equal length before the eye the difference in the size of their scales is readily apparent.

Scales.

It is not worth while for the angler to go into the number of rows of scales above and below the lateral line, as the fish sharps do; but it is important to note where scales grow. Of course if a fish is without scales, as the eel and catfish, the fact should be noted. The body may be well scaled and the head entirely naked, as is the case with the chubs, trout and others, or the head may be covered with scales, as in the salt-water drum, weakfish or squeteague, croaker, kingfish or barb, and that fresh-water relative, the gaspergou or drum, etc.

The three divisions of the pike family are distinguished mainly as follows: Cheeks and gill cover naked, maskalonge; cheeks naked and opercle (gill cover) scaled, the great pike; scales on both cheeks and opercle, pickerel, or the two small species of brook pike. All this it is important to note.

Teeth.

Teeth are to be noted if the fish is a strange one. The pikes have strong, single canine teeth on the jaws, but in the roof of the mouth we find three bands of bristle-like teeth, in the middle of the "vomer," that bone which we can feel in our mouths and which separates the nostrils, and also large patches on the palatine bones, which lie on each side of the vomer, as well as small teeth on the tongue.

The teeth of the black bass are all bristle-like; the bluefish of salt water has teeth set in a row along the jaws, and are capable of biting a piece out of a herring, which most other fish cannot do. The pikes, perches and basses can hold a smaller fish in their teeth, which all slant backward, but cannot bite a piece from a fish as the bluefish can. Then we have another type of teeth—that of the sheepshead and drum. The sheepshead has teeth in its jaws that are almost human; they project, and are used for cutting off the byssus of the salt-water mussels, *Mytilus*, by which they adhere to wrecks and rocks, and then the shells are crushed by what is properly called a "pavement" of teeth in the roof of the mouth. So powerful are these that the drum destroys oyster beds, crunching the shells and ejecting them after the oyster is extracted. Therefore don't neglect the dentition when you describe a fish. Note if the fish has a barbel on the lower jaw, as in Fig. 3; the catfish has them on both jaws.

The Mouth.

Some fishes have the jaws even; others are "overshot," as the drums and all the bottom-feeders, i. e., the upper jaw is longest. Fishes which usually get below their prey, like the bass and pikes, have a longer lower jaw. The broadly smiling catfish has its jaws of equal length and takes its food in any way that it offers; if on the bottom it will stand on its head to take it.

Then there are mouths which are protractile, and can

Fig. 3.

be thrown out, like the carp and some other soft-finned fishes, the hippocampus and others. This feature is more pronounced in the fresh-water suckers and in the sturgeons, which are bottom feeders.

Shape.

This is important. In addition to the length of the specimen and the location of its capture, one of the most important things to know is its shape. Is it almost cylindrical, like the pikes; compressed laterally, like the sunfishes, or is it triangular, like the trunk fishes of salt water? Then the degree of compression should be stated in its depth, measured at the dorsal fin, and its thickness, as: "Slightly compressed," black bass; and "greatly compressed," sunfish and the crappies.

All that is Necessary.

These points are really all that is necessary for an angler to know in order to describe a fish which is unknown to him to one who has made a study of fishes. I have tried to simplify it, and hope that the effort has been a success; but the learned ichthyologist goes away into the air bladder, the stomach appendages, and the teeth in the throat of the chubs and other cyprinoids, which is chopping it too fine for us fellows who go a-fish

ing and only want to be able to put our catch in the right class, and to give them the name which belongs to them by right of usage, and which is accepted by the majority of anglers and specialists in fish lore.

Color.

This is of the least importance; yet the angler is apt to attach great value to it. Let us see how little there is in it. The mascalonge is black-spotted in the Great Lakes and in Minnesota, but has no spots in Chautauqua Lake, N. Y., nor in the Ohio River and its tributaries, where it is occasionally found. The white perch of brackish waters and coastwise streams is of a drab color in saltish water, and is bright silvery in the upper rivers. The Eastern brook trout loses its red spots if it remains long in salt water, but regains them after ascending the streams. Few fish vary as much in color as this trout does, according to the waters it happens to be in; on Long Island the trout are much lighter in color than those from the Adirondacks, while many Canadian trout are almost black.

In some species we find the males differing greatly from the females at breeding time, especially in the cyprinoids, or soft-finned, toothless fishes, of which we have over seventy species, such as chubs, horned dace, shiners, and a host of small species which only attain a length of 2 or 3in., for which the angler has no other name but minnow, often corrupted into "minny"; but the student of fishes takes them all in, and sees that they differ. The so-called "red-finned shiner" (*Luxilus cornutus*), which is found "in all brooks from Maine to the Rocky Mountains, except those of the Carolinas and Texas," is a fair sample of the value of color. Only the male has red fins, and he only in the breeding season. At this time his head is covered with hard tubercles, which are shed when the season is over. This is a common fish in Adirondack waters. It runs into the streams in June to spawn, and then the males are exceedingly brilliant. Their length is about 5in., and the sexes

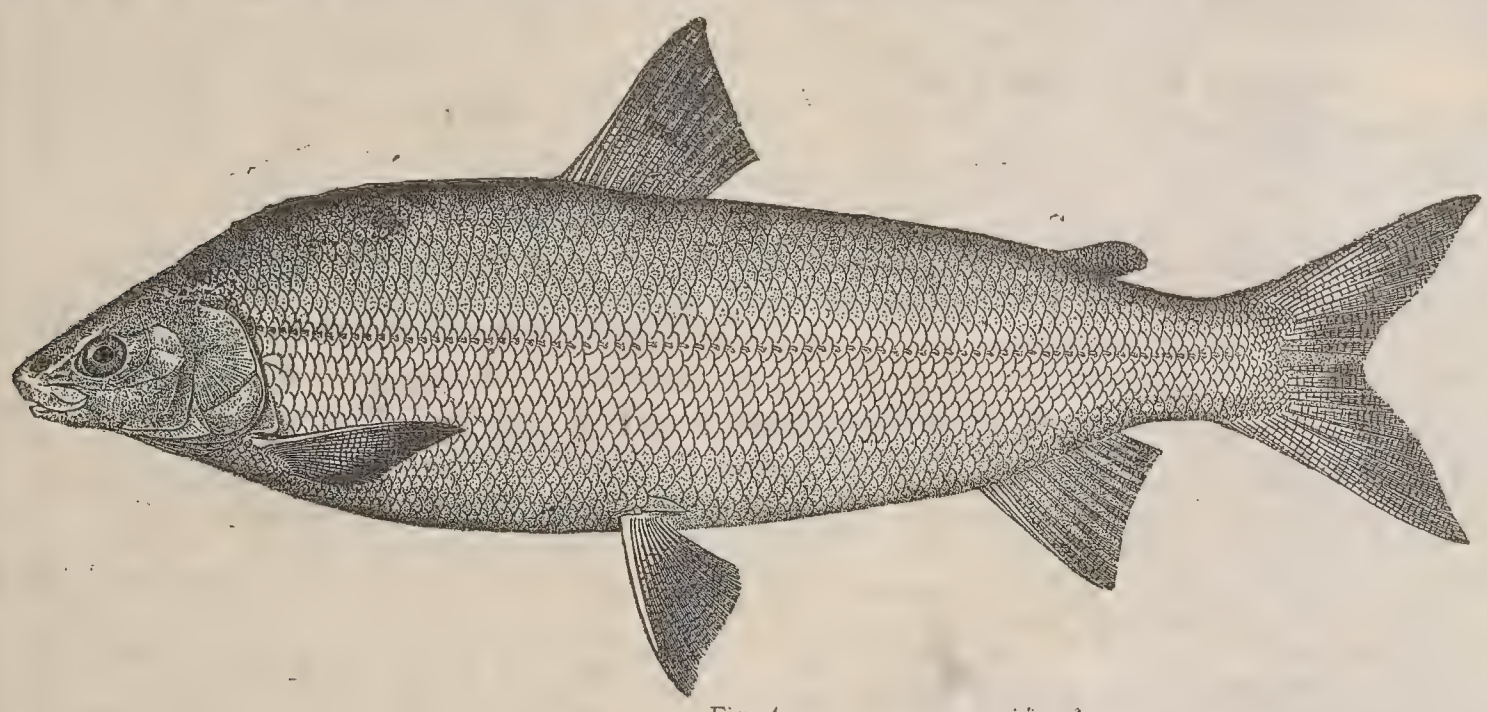

Fig. 4.

are so different in appearance at spawning time as to be taken for different species. It was only by opening many specimens that I convinced a dozen or more of the guides that the "red fins" were all males and the "shiners" were all females, by showing that the "shiners" alone carried eggs.

Our creek chub, called horned dace, has protuberances on the heads of the males at breeding time, hence "horned." This fish grows to a foot in length, and is a favorite with boyish anglers, but while its colors do not vary much it is introduced here to show that other things vary besides color.

Some species seem to be permanently marked, like the yellow perch, with its ground-work of yellow and its dark bands, which are merely intensified at the breeding season; but curiously the salt-water fishes do not seem to change their colors much at that time. The male brook trout brightens his fins at the mating period, puts on a brighter red on his lower sides, and at the height of that season adds to his war paint a stripe of black just above the ventral fins, and tops off with a drab coat on his back, being an entirely different looking fish for a fortnight, some time between November and January, than he is during the rest of the year.

Color is a thing to be noticed; for in some species it is of value; but it is not to be relied on in diagnosing a fish. It has nowhere near the value that it has in determining species among birds, because it is more variable.

The Important Points.

As all this may be thought difficult to master, as given in detail, let me make the points plainer by a synopsis. To describe a fish note the shape—flat, compressed or cylindrical; position, number and character of fins, with their ray formula; shape of caudal fin; number of scales in the lateral line; barbels, if any; scales on any part of head, or their absence; teeth, as indicated above; and the position of the mouth, as terminal, etc. After all these structural differences, which cannot be varied by any change of habitat, you can add the colors. These are the points on which an expert would think it worth while to give an opinion as to the place of any particular fish in the system, and they are not hard to learn.

There are minor points, and I only mention them to show that what has been written is not the whole of ichthyology. One of these is: In the black basses of fresh water there is a character which has not been mentioned; that is, the small-mouth has minute scales on the soft parts of its dorsal and anal fins, while the big-mouth has none.

Nomenclature.

For convenience all fishes are first grouped into families from some peculiarity of structure common to all, and the name usually ends in idæ, as salmonidæ, the salmon family, which includes fishes of quite different structure, but may be described as: "Body oblong, covered with cycloid scales; head naked; mouth terminal or subinferior, of varying size; teeth various; maxillary with supplemental bone forming side of upper jaw; pseudobranchiæ (false gills) present; no barbels; dorsal fin median; an adipose fin; ventrals median; lateral line present; belly not compressed; vertebræ about sixty. Stomach siphonal, with 15 to 200 pyloric cœca; eggs large; no oviduct."

In this family we find several genera, and a genus is nearer to what we consider a human family, in the narrowest definition of that term, for here we find two names for each fish, the generic and the specific. The salmonidæ has the following genera; *Coregonus*, the whitefishes; *Thymallus*, the graylings; *Salmo*, the salmons; *Salvelinus*, the chars. In naming a fish the genus is placed first, just as we index: "Smith, John," and "Brown, James"; so we say of the chars: *Salvelinus namaycush* for the lake trout, and *S. fontinalis* for the brook trout. The object of using Greek for the generic and Latin for the specific name is that these names are accepted by scientific men the world over, and if I write of capturing a pike the name is merely an English one. The Germans call the fish *hecht*, the French *brochat*, etc., but if I write pike, *Esox lucius*, the Russian, Dane and Japanese know as well as the German and the Frenchman the exact fish intended, for it is named in the language of science.

The local angler may recognize the need of such a universal language when he realizes that partridge means a small bird in Virginia and the South, and a large one in New York and further East; and that but three fishes on our Atlantic coast—the eel, sturgeon and shad—bear the same name from Maine to Texas. That the name blackfish in New England means what is a sea bass in New York, *Centropristis striatus*, while east of New York the Indian name of tautog is used; among the whalemen from Long Island to Maine blackfish is the name of a small whale. Chub in the North means one of the two species of large cyprinoids, soft-finned, while on the Tar River, North Carolina, the name chub is applied to the black bass.

These examples show that the vernacular names are so largely local as to be of no value beyond the localities where they are used, and they are often loosely applied there; hence the necessity of a nomenclature that is universal.

In the early days of Forest and Stream the older anglers ridiculed scientific nomenclature; they "didn't see the use of it; a bass was a bass and a trout was a trout, what more do you want?" At the first meeting of the American Fishculturists' Association, now the Fisheries Society, an ignorant, egotistical boor, who posed as the only authority on fish, made some remarks about a trout. Mr. William Clift, the first president of the society, asked: "Mr. ——, do I understand you to refer to *Salmo fontinalis?*" Our Eastern brook trout was then classed in the genus *Salmo*.

With scorn in his emphasis, the man addressed answered: "Well, you might call him that, or you might call him a sawbuck; I call him a trout," and then he rambled on. That day has passed, and the observant angler has developed into the "scholarly angler" in America, and within a quarter of a century has so influenced angling literature that such a scene in the proceedings of an angling or fishcultural society would be impossible to-day.

Chicago Fly-Casting Club.

Chicago, Aug. 27.—*Editor Forest and Stream:* Here is the score of the contest of the Chicago Fly-Casting Club, held to-day:

	Long Distance Fly, Feet.	Distance and Acc'y, Per Cent.	Accuracy and Del'cy, Per Cent.	Bait Casting, Per Cent.
I. H. Bellows	117	95	96 1-3	92 3-5
C. F. Brown	..	93 1-3	94 1-6	91 3-5
N. C. Heston	..	..	..	95 4-5
C. G. Ludlow	113	..	..	..
H. W. Perce	..	86 1-3	..	96 1-5
H. A. Newkirk	..	96 2-3	95 1-6	97 1-5

This closes the season for 1898, and determines the medal winners for the year of the different events, as follows: Long distance fly, F. N. Peet; distance and accuracy, I. H. Bellows; accuracy and delicacy, C. A. Lippincott; bait casting, H. G. Hascal; all-round championship cup, I. H. Bellows.

G. A. Murrell, Sec'y.

The Forest and Stream is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

An Outing on Lake Lagunitas.

Through the kindness of the president of the San Francisco and North Pacific Railroad, Dr. W. E. Brooks, E. W. Currier and James Watt were granted a permit to fish on Lake Lagunitas, one of the prettiest bodies of water in the State of California. This lake is situated in Marin county, about four miles from Ross Station, a lovely suburb of San Francisco. A walk through Ross Valley and up what is known as the Fish Grade brings you to the lake. On entering the grounds you are received by the keeper or his good wife, attended by a retinue of noisy canines. Our permits having been taken up, we proceed at once to the boat house, where, through the kindness of Mr. Foster, we find a boat at our disposal. The day was a very unusual one for Ross Valley and the lake; there being a heavy mist and drizzling rain, and fly-fishing was out of the question, hence we had to resort to the expedient of trolling. Bait fishing is not allowed, and trolling has only been in vogue within the past year or two. The spoons and spinners used by the sportsmen of California are of the smallest pattern, and nearly every one has his individual preference. Brooks and Watt occupied the boat, while Currier preferred to fish from the bank, quite a difficult feat, as in most places it is very abrupt, and foothold quite insecure. However, Mr. Currier's principal object was to locate a suitable place to take a sketch. Commencing at the east arm of the lake, we trolled it thoroughly with very little success, as at the noon hour we had only four fish, but they were beauties. Mr. Watt then concluded to try his luck from the shore, and the Doctor, left to himself, started on a prospecting tour up the south lagoon, and was delighted to find the fish were jumping in all directions; he very speedily added a dozen or more to his creel.

Mr. Currier had at last found a beautiful spot, and was making a sketch of the extreme end of the lake, with Mount Tamalpias in the background, which is one of the most charming bits of California scenery to be found in many a day's travel. The Doctor, however, being more of a fisherman than an artist, lingered not, but proceeded on, when a signal from the other side of the lake drew his attention to the fact that Watt was anxious to enjoy some of the sport which he could see the Doctor was having. Watt was taken aboard, and for the remainder of the afternoon we both were as successful as any two Nimrods could desire; the sport only ceasing when we had each caught our limit.

By this time Mr. Currier had finished his sketch. The return trip was uneventful. All things combined, Thursday, the 12th day of May, 1898, furnished an outing for us that will long remain a pleasant memory.

J. W.

San Francisco, California.

New Jersey Shore Fishing.

Asbury Park, N. J., Aug. 27.—Surf fishing the past few days has received a most decided setback, presumably caused by an extremely cold current, which has set in from the south. Why a southern current should produce this is hard to determine. Still we have that effect, and the cause remains unknown. So cold has it been that one could scarcely stand in the water, although protected by lined rubber boots. However, the conditions are modifying some, and fish are again beginning to be in evidence. I recently mentioned the taking of the croaker from the boats which go out to sea, and expressed some doubt as to the identity of the fish, as they had never before been taken in that manner so far north in any quantity. An examination firmly establishes the fact; and those who have angled for them are quite enthusiastic in their praise as good biters and hard fighters, resembling in many respects the sheepshead in their movements. They are quite a common fish in the estuaries around Cape May, but I have never found them to be extraordinarily game; in no respects do they excel the weakfish, weight considered. Yesterday one was taken from the Asbury Park pier, the first one ever taken from either of our piers here.

Snapper fishing is now beginning to claim the attention of hundreds of anglers daily. While they are not yet very abundant, still they are of fine size thus early in the season, and the delight they afford on lightest of tackle is thoroughly appreciated. I know many men who have taken the muscalonge in the North, and battled with the lordly tarpon in the South, and when blues and weakfish were biting all around them devote whole days to pursuit of the sprightly snapper. As with your trout fishermen, both could easily take game producing more pounds of meat, but that is a different story.

Leonard Hulit.

Big Black Bass.

New York, Aug. 22.—*Editor Forest and Stream:* The largest black bass taken from Popolo Pond, near West Point, this year was caught by Mrs. J. Yale, of Fishkill, N. Y., on a 7oz. fly-rod last Thursday.

The fish made a vigorous fight, but being adroitly handled the prize was soon in the boat and tipped the scales at 5½lbs.

On our way out Thursday we passed Long Pond, where we saw the Riddell boys fishing. On inquiring as to how fish were biting Bob answered laconically, "I don't know; we have only been here since last Monday."

J. J. R.

Not Unreasonable.

The Lake County (Mich.) Star prints the following card:

To Fishermen!

I wish all fishermen to either keep in the stream or along the banks thereof in crossing my fields south of town. Do not tramp over my crops, or destroy them in quest of angleworms. I do not object to fishermen having a fair show, but I am farming and want them to give me some show for my crops.

Geo. J. Austin.

An Adventure with Tramps.

There are still more reports of good black bass fishing at Sebatis, Me. Mr. Geo. Lynch is reported to have taken two bass there on Saturday, the united weight of which was 5lbs.; the largest fish taken there this season. Two young men from Brunswick went up to Sabatis Pond to fish the other day. They had caught a number of bass and perch by noon, and went ashore to cook some of their fish and eat their dinner. When their dinner was about half cooked they were set upon by three dirty-looking tramps, who demanded a share in the dinner. They were refused, but skulked around through the bushes and stole the young fishermen's boat. They were seen just as they shoved off in the boat. The young men followed along abreast of the boat on the shore. At last other men in boats frightened the tramps till they were forced to go ashore, where they soon fell into the clutches of the young sportsmen, who had lain in wait for them. The boys pitched into the tramps and declare that they gave them a good thrashing, though one of the fishermen carried his arm home in a sling, and the other had a bad bruise on his face. Auburn reports say that a steamer route is to be established around Sabatis Pond, for the accommodation of fishermen and people who would like to build summer cottages on the shores.

Special.

Red Drum on Long Island.

Long Beach, Long Island, Aug. 28.—G. P. Morrosini, of Riverdale, captured a red drum fish, or red horse, while fishing from the beach on Saturday. The fisherman was alone, and without a gaff or landing net. It took over an hour to kill the fish. During the struggle 900ft. of line was used. The fish weighed 41lbs. Weakfish and fluke have been biting freely, and some fine catches are reported. Fishing in the breakers from the beach requires much skill in casting, but it is good sport, and the fisherman is usually rewarded with some fine fish. Bass have not yet been caught by casting from the beach, but they will appear later in the season.

Fisheulture.

Some Fish Farming Figures.

From the Indianapolis Journal.

"BASS VS. BEEF."

Fish Farming and Grain Farming Compared—Astonishing Results.

To the Editor of the Indianapolis Journal:

It is passing strange that in all the time, labor and money expended in the hatching and rearing of fish no experiments have been made to determine the relative value of water farming and land farming. There are many and various theories and opinions in regard to the matter, while there are few, if any, authentic records of results practically. Among the utterances and expressed opinions may be found one to the effect that an acre of water will produce 500lbs. of fish, and another that an acre of water will produce one ton of fish per annum, and various others, all showing more enthusiasm than absolute knowledge.

Some facts of a practical character have passed under my personal observation, which I will briefly state. At Warren, Huntington county, Ind., an excavation was made in a lot belonging to Smethurst & Thompson, owners of a steam flour mill, for the purpose of obtaining gravel with which to improve the streets. The lot had been carefully measured and staked, 60 by 120ft., and when the gravel was removed was in the form of a cellar of that size, 6ft. deep at one end and 8ft. at the opposite end, the bottom having a sloping grade line. In finishing the excavation, water presented itself at the lower end, and gradually increased until, at the close of the dry season in 1894, water was standing from 1 to 2ft. in depth, and later, after the autumn rains, rose so as to completely fill the space to the margin, and so remained during the winter of 1894-95. In the spring of 1895 Mr. Thompson, who has become authority in bass propagation, placed four pairs of small-mouth adult bass in the pond so formed. He watched their actions carefully, as the water was clear; and as the warm weather came on he saw that they were clearing off beds in the gravelly bottom and preparing to spawn. This was accomplished about the middle of May, and in due course of time the hatching followed, and thousands of young bass swarmed about the nesting places. Mr. Thompson was highly gratified at the success of his experiment of hatching bass in confinement, as it settled a very important question in regard to propagating black bass, which had occupied the attention of amateurs and professionals, as well as the United States Fish Commission, for years, and subsequent experience has verified his conclusions.

As may well be supposed, Mr. Thompson gave very strict attention to the progress of his numerous and growing finny family, as opportunity was thus afforded him of noticing and determining the progress of their growth, which was here for the first time afforded. Having been advised by Mr. Thompson of his success, I made it convenient to visit Warren about Sept. 1 of that year, and found a pond of fine clear water abounding in young bass a little more than three months old, from 3½ to 5in. long, lively and healthy, and in countless numbers; and as I watched their movements an impression of thousands was made on my mind, and up to this date, and after no food of any kind had been given them. The cold winter of 1895-96 followed, and the water in the pond was almost a solid mass of ice; when it thawed out in the spring hundreds of small bass that had been enveloped in the ice were found dead around the margin of the pond, many of which were over 6in. in length. As the season progressed, there was no perceptible change. The fish were constantly increasing in size, and there was an entire absence of sick or dead ones. I visited the family, in which I was now very much interested, again in August, 1896, when the fish were one year and three months old, and was most agreeably surprised at the wonderful growth they had made during the year; their increased size made it difficult to realize that any had died or were missing since I had seen them nearly a year before. But here was an opportunity to get at facts such as I had never had before; for, in the first place, I knew definitely the age of the fish, and I soon prepared myself to know his length and weight; so I rigged up a hook and line and rod, secured a few minnows, and removing the barb from the hook I threw in for a bite and soon got it. I hooked my fish and lifted him to land, and found a nice, plump bass 11½in. long and weighing 13oz. on the scales. I now had a starting point for a statement. I continued fishing until I had pulled in seven, the largest being 15in. in length, and weighing 16½oz., a little over a pound, and there were some still larger than it was. From all this I learned, first, that bass will spawn and hatch in a pond or inclosed water; second, that under favorable conditions bass will weigh 1lb. each at one year old; third, that a brood of bass, like a brood of chickens or pigs, will vary in size and weight at the same age.

The only item not obtainable was the number of bass in the pond. I estimate the number at 1,000 at the lowest, and Mr. Thompson, who had watched them from the day they were hatched, was of opinion that there were nearer 1,500; several other business men who were present agreed with Mr. Thompson. Now the pond contained 7,200sq. ft., which is less than one-fiftieth of an acre, and estimating the pond to contain 1,000lbs. of bass, which it would with 1,000 fish at 1lb. each, and for less than one-fiftieth of an acre you have 1,000lbs., or at the rate of over 50,000lbs. per acre, or more than twenty-five tons.

An acre of corn will make not to exceed 400lbs. of beef or pork or mutton, which sells at from 4 to 6 cents per pound, live weight; your bass brings 10 to 12 cents, and counting the cost of land and water the same the land requires labor, seed, manure and teams, while the value of its product, 400lbs. at, say, 5 cents, is $20, from which deduct expenses, and you have $15 from an acre of land; while from an acre of water there are 50,000lbs. of fish at 10 cents, or $5,000, the sole and total cost of which is the item of procuring the parent bass and placing them in the water. But suppose my estimate of the number of fish in this pond is too high; suppose there were only 500 instead of 1,000; then we have 500lbs. in the pond, or 25,000lbs. per acre. Or, to go further, say there were only 100lbs. in the pond; then we have 5,000lbs. per acre, or $500; or, to go still further, say there was only one bass in the pond, weighing 1lb., that would make 50lbs. per acre, or $5 clear of all expenses.

The foregoing statement in regard to the circumstances at Warren can be readily verified by the affidavits of reliable parties. All of which goes to show that an acre of water, under favorable circumstances, and without labor or expense, will produce 50,000lbs. of bass per annum, worth 10 cents per pound, and of the total value of $5,000, while an acre of land, under favorable circumstances, will produce beef of the value of $20, from which deduct $5 for expenses, leaving $15 net, showing a difference in favor of water farming of $4,985 per acre.

There are 300,000 acres of water in Indiana.

Editor Forest and Stream:

Herewith are lists of the club's all-age and amateur stakes, which closed on Aug. 1. The all-age consists of ten pointers and thirteen setters, a total of twenty-three. Amateur stake is made up of three pointers and eleven setters, or fourteen in all. Birds are fairly plentiful, and everything points toward successful trials:

All-Age Stake.

Tannis—E. J. Bennett's b. and w. pointer bitch (Rector—Miami).

Elgin's Dash—D. E. Rose's, agent, o. and w. pointer dog (Kent's Elgin—Maxo Juno).

Sport McAllister—D. E. Rose's, agent, b., w. and t. setter dog (Tony Boy—Blue).

Pearl R.—D. E. Rose's, agent, b., w. and t. setter bitch (Sam Gross—Donna Inez).

Chisholm—D. E. Rose's, agent, liv. and w. pointer dog (Von Gull—Croxie Kent).

Lord Buster—B. Gordon's liv. and w. pointer dog (Lord Mount— ——).

Pin Money—Charlottesville F. T. Kennels' b. b. setter bitch (Count Gladstone—Daisy Croft).

Sepoy—Charlottesville F. T. Kennels' liv. and w. pointer dog (Ch. Rip Rap—Queen III.).

Begum—Charlottesville F. T. Kennels' b. and w. pointer bitch (Ch. Rip Rap—Queen III.).

Daisy of Kippen—Charlottesville F. T. Kennels' liv. and w. pointer bitch (Ben of Kippen—Comedy).

Mac—E. Hamber's b. and w. pointer dog (Coxeth Ned—Miami).

Columbus—W. F. Ellis' b., w. and t. setter dog (Duke of Manitoba—Hickory Link).

Maid of the Morn—W. F. Ellis' b., w. and t. setter bitch (Val Lit—Cam Sing).

Nellie—Thos. Johnston's b. and w. setter bitch (Ponto—Bess).

Sancho—Thos. Johnston's b. setter dog (Manitoba Toss—Bess).

Mac—J. Lemon's liv. and w. pointer dog (—— ——).

Ben Bondhu—J. Wootton's b. and w. setter dog (Dick Bondhu II.—Maud á Rose).

Ortolan—Chimo Kennels' b., w. and t. setter bitch (Orlando—Atlanta).

Sut—R. McLennan's b. setter bitch (Toss—Pitti Sing).

Duke's Rush—Winnipeg Kennels' liv. and w. setter dog (Duke of Manitoba—Cam Sing).

Angela—F. W. Scott's b., w. and t. setter bitch (Gath's Mark— ——).

Lonsdale—J. Phillips' liv. and w. ticked pointer dog (Coton's —— —Psyche).

Blucher—Chas. Whitehead's b. setter dog (Sancho—Psyche.

Amateur Stake Forfeit.

Tannis—E. J. Bennett's b. and w. pointer bitch (Rector—Miami).

Lord Buster—B. Gordon's liv. and w. pointer dog (Lord Mount— ——).

Columbus—W. F. Ellis' b., w. and t. setter dog (Duke of Manitoba—Hickory Link).

King—W. F. Ellis' b., w. and t. setter dog (Duke of Manitoba—Maid of the Morn).

Maid of the Morn—W. F. Ellis' b., w. and t. setter bitch (Val Lit—Cam Sing).

Silver Lace—W. F. Ellis' b. and w. setter bitch (Val Lit—Cam Sing).

Exasperator—W. F. Ellis' b., w. and t. setter dog (Duke of Manitoba—Dora M.).

Mac—J. Lemon's liv. and w. pointer dog (—— ——).

Rosa Bondhu—J. Wootton's b., w. and t. setter bitch (Dick Bondhu II.—Maud á Rose).

Bonnie Lit—J. Wootton's b. and w. setter bitch (Orlando—Lady Lit).

Count Cambria—H. S. Rolston's w. setter dog (Gladiator II.—Miss Cambria).

Duke's Rush—Winnipeg Kennels' liv. and w. setter dog (Duke of Manitoba—Cam Sing).

Prince Rupert—Chimo Kennels' b. and w. setter dog (Larry Noble—Atlanta).

Angela—F. W. Scott's b., w. and t. setter bitch (Gath's Mark— ——).

William C. Lee.

Points and Flushes.

The Canadian Kennel Club will hold its annual meeting in the board room of the Exhibition Association, Toronto, Sept. 7, at 10 o'clock A. M. A list of officers was elected as follows, Aug. 16: Patron, Hon. Senator Sanford; Hon. President, Richard Gibson; President, John G. Kent; First Vice-President, Dr. J. S. Niven; Vice-Presidents, F. T. Miller, Jos. A. Laurin, E. R. Collier, Rev. J. W. Flinton; Secretary-Treasurer, H. B. Donavan, Toronto.

The New England Kennel Club will hold a two-days' show, under A. K. C. rules, at the club grounds, Braintree, Mass., Oct. 14 and 15. The prize list will be ready for mailing on Sept. 3, and it will be essentially the same as that issued for the show of June 4. Ample arrangements will be made on the grounds for the large attendance which will be present. Everything will be done by the management to make this show popular and within the reach of all.

The famous English setter dog Antonio (Roderigo—Bo Peep) died last week. He was a famous field trial winner, and also was quite successful on the bench. In field trials he won first in the all-age stake of the Southern Sportsmen's Association, Lafayette, La.; first all-age stake at the Southern Field Trial Club, New Albany, Miss.; first in champion stake, Eastern Field Trial Club; free-for-all of the Central Field Trial Club, Lexington, N. C., all in 1891. Bench shows: First in field trial class, Washington, March, 1893; first, New York, 1894; first, Philadelphia, 1894. He was owned by the Eldred Kennels.

Mr. W. H. Hammond, well known as a trainer of dogs, goes south about Sept. 15 with a fine string of field trial candidates, of whose capabilities he speaks highly. He will locate for some time at Thomasville, N. C., preparing for the trials in North Carolina and Mississippi. He mentions that he has room for a dog or two in his school.

PRIZES FOR AMATEUR PHOTOGRAPHS.

The Forest and Stream offers prizes for meritorious work with the camera, under conditions which follow:

The prizes will be divided into three series: (1) for live wild game; (2) for game in parks; (3) for other subjects relating to shooting and fishing.

(1) For live game photographs three prizes are offered, the first of $50, the second of $25, and the third of $10.

(2) For live game in parks, for the best picture, a prize of $10.

(3) For the best pictures relating to Forest and Stream's field—shooting and fishing, the camp, campers and camp life, sportsman travel by land and water, incidents of field and stream—a first prize of $20, a second of $15, a third of $10, and for fourth place two prizes of $5 each.

There is no restriction as to the time nor as to where the pictures have been made or may be made.

Pictures will be received up to Dec. 31 this year.

All work must be original; that is to say, it must not have been submitted to any other competition or have been published.

There are no restrictions as to the make or style of camera, nor as to size of plate.

A competitor need not be a subscriber to the Forest and Stream.

All work must be that of amateurs.

The photographs will be submitted to a committee, who, in making their award, will be instructed to take into consideration the technical merits of the work as a photograph, its artistic qualities, and other things being equal, the unique and difficult nature of the subject.

Photographs should be marked for identification with initials or a pseudonym only, and with each photograph should be given, answering to the initials, the name of sender, title of view, locality, date and names of camera, and plate or film.

Tall Tales of James Bowie as a Hunter.

As a hunter James Bowie did more than credit to his blood and training. Off-hand with a rifle he could bring down a wild goose flying high overhead, and put his bullet in the neck five times out of seven. But marksmanship bordering on the marvelous was a common attribute thereabout. What gave the young sawyer distinction was another story.

Several sorts of another story, in fact. He could not merely shoot deer running, but lasso them in fair chase over the prairie, give them a fall, and, if it pleased him so to do, fetch them in alive and unharmed. He could likewise lasso a horse from the wild herds, mount him without anybody's help, and stay upon his back, no matter what was done, until the terrified beast had run himself tame. By way of variety, sometimes the lasso was cast over a big bull alligator waddling from swamp to swamp. When it had been drawn taut, holding tail and jaws in leash, young Bowie mounted the scaly back and rode there, laughing and shouting, while the astonished saurian went bellowing with rage toward his swampy haunts.—Martha McCulloch Williams in Harper's Magazine.

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

26. Newport, ladies' day, Narragansett Bay.
29. Miramichi, Gould cup, Newcastle.
30. Taunton, ladies' day, Taunton, Mass.

OCTOBER.

14. Miramichi, Watt cup, Chatham.

AT a time when the general conditions of both business and sport point to a marked revival of yachting after several years of depression, the condition of yacht construction is most discouraging. The condition of the two Seawanhaka representatives, the most costly boats of their class ever launched, is well known to all who were at Lake St. Louis, both being probably beyond repair after a few races. Of the two boats in a similar class just racing at Boston, one had to be almost rebuilt in order to make her safe for the series of races for which she was built, and according to reliable report she was only measured into her class by the radical expedient of heaving her bow up so as to shorten her waterline. The other was nursed carefully through one race of the series in order that there might be enough of her left to sail out the season and make a record in her class.

The next thing on the boards is the rebuilding of Defender for the trial races of 1899, which should shed valuable light on modern yacht construction; and this will be followed by the same dangerous and mischievous competition in the building of both challenger and defender for next year. So far as the defender is concerned, there is very little risk, as in case of her total collapse all or nearly all of her crew might be saved by her steam tender and other boats. When it comes to the challenger, however, the case is very different. If Mr. Fife goes far enough in light construction to place him anywhere near a fair equality with American designers, he must risk the possible loss of vessel and crew on the ocean passage. As racing construction stands to-day, it is difficult if not absolutely impossible to build a yacht for a long ocean voyage and yet keep her light enough to be on even terms with one constructed merely for less than a dozen races within three miles of the shore. The natural end of the present keen competition in construction must be the loss of a large yacht sooner or later; and yet those yacht clubs whose avowed end is the promotion of sport either cannot or will not take action for the establishment of limitations on construction before they are forced to do so by public opinion.

THERE is a general disposition on the part of both English and American journals to gush over Sir Thomas Lipton's challenge as something specially fair and sportsmanlike, and also over the readiness with which all overtures have been welcomed by the New York Y. C. The situation to-day, so far as the challenger is concerned, is identical with that existing just twelve years ago, when Mr. G. L. Watson visited New York as the authorized representative of the Royal Clyde Y. C. to arrange a match with the New York Y. C. for the America Cup. The overtures of the Royal Clyde Y. C. were perfectly fair and frank, it expressed a desire to challenge for the Cup, and a preference for yachts of 70ft. l.w.l., but at the same time was willing to build to 90ft. l.w.l., or any other limit which the New York Y. C. might prefer. It did, it is true, go so far as to intimate that a series of five in place of three races would be fairer as a test of the boats, minimizing the chances of the weather. The action of the New York Y. C. was to dispose as curtly and discourteously as possible of the whole matter by a brief resolution that a printed copy of the deed of gift be sent to the would-be challenger, with a notice that "a challenge in due form" would, when received, be duly considered. In this action the club took refuge behind a technicality, the then existing (second) deed of gift, through its faulty wording, prohibiting more than seven months' notice of challenge, while the Royal Clyde Y. C. was giving ten.

In the matter of a mutual agreement as to one common length for both challenger and defender, it took refuge behind another absurd technicality, stating that it, the club, did not build yachts to defend the Cup, but was obliged to use such yachts as were offered for its trial races; and that it had not the power to dictate to individuals the size of yachts they should build. The result of this action, as everyone knows, was that Thistle was built under lock and key.

In view of occurrences such as this throughout the entire history of the America Cup, that broad and liberal sportsmanship for which Sir Thomas Lipton is now generally praised seems to us more like inexcusable ignorance of the whole matter; an ignorance which must lead in the end to a dispute of some kind. It is a most difficult matter for two parties, each composed of expert yachtsmen and acting in perfect good faith and harmony, to arrange the numerous technical details of an international match, and unless such details are fully provided for in advance there will inevitably be trouble in the end. In this case the challenger proposes to leave everything to the holder, with the most childlike confidence that every one of his interests will be protected. A man who is not enough of a yachtsman to know what he wants and to what he is fairly entitled in making a match must be much more than human if he does not, rightly or wrongly, feel that he has been unfairly treated when he loses.

There is no doubt that the conditions of the last two matches will be substantially followed in the present match, but that these conditions are in themselves fair is due only to the long and obstinate fight of both British and American yachtsmen against the New York Y. C., and to the arrangement with Lord Dunraven by which, in return for a challenge, he was given such terms as had been denied to Lieut. Henn and Sir Richard Sutton.

While we cannot share the popular enthusiasm over this new match, we hope, in the interest of yachting, that it may be sailed to a conclusive finish without the too frequent sequel of a quarrel. This can only be done, however, by a complete and thorough understanding on both sides of the full terms of the match; the challenger not being a mere dummy, but fully conversant with those rights accorded to him by fair yachting usage, and prepared to contend for them if necessary.

The Seawanhaka International Challenge Cup.

IN spite of the space devoted to the races for the Seawanhaka international cup in our last issue, there were numerous points of minor interest that were necessarily neglected. One matter that engrossed the attention of all parties was the possible meeting of Challenger and Speculator, and several efforts were made to bring this about. Immediately after Tuesday's race Messrs. Crane and Duggan were consulted by a representative of interested parties on board the club steamer, who had guaranteed a suitable prize of money or plate, running up to a cup of the same value as the trophy, for a match between the two yachts. Mr. Crane was unable to give any positive answer, owing to the difficulty in keeping his crew together after the cup matches were over.

On Sunday, after the first race, the suggestion was made to Mr. Duggan informally that, as the superior speed of Dominion was already established, and as there was no desire on the part of the holders merely to keep the cup, it might be well to offer to sail the remaining races of the series with Speculator instead of Challenger. The suggestion was well received by him and was laid before several members of the sailing committee. The only objection made to it was that it would at once be accepted by the other side as an admission that the committee was in the wrong in building and selecting Dominion. The matter was discussed seriously on the three following days, and after the final race on Wednesday a number of the Royal St. Lawrence men were perfectly willing to make the offer to call off the series of races and to start anew for the cup with Speculator against Challenger. There were three practical difficulties in the way of such a plan; in the first place it was doubtful whether Mr. Duggan's health would permit his participation in a new series of races, and without him at the stick the contest would have been worthless; in the second place, Challenger was already badly damaged, and getting worse with each day in the water; in the third place was the original question as to the spirit in which such a proposal would be received. On his return to the club house Mr. Crane was approached in the matter, but he would only consider it with the definite understanding that the Royal St. Lawrence Y. C. admitted that it had done wrong in selecting Dominion. This, of course, put an end to all ideas of further racing on this basis.

So far as the further possession and defense of the cup is concerned, there is a very general feeling on the part of Montreal yachtsmen, especially those who have carried on the actual work of the last three years, that, while the task of defending the cup must be a heavier one each year, even if it be successful, it can do no further good to the club.

The result of the first two races, the winning of the cup by Glencairn I. and its successful defense by Glencairn II., was in every way beneficial to the club. It was placed in a prominent position, in Canada and abroad, its members were awakened to a new interest in it, material improvements to the club property were made possible, and a strong interest in designing, building and racing was aroused among the younger members. It is quite evident now, however, that the influence of the competition has changed, and that it is of no further benefit to the club. In order to make a suitable defense of the cup this year, all the energies and resources of the club and its individual members have been concentrated on the production and development of a small fleet of useless racing machines. The club fleet of useable yachts has completely disappeared, and the only boats afloat off the station are the few racing 20-footers.

During the winter Mr. Duggan designed a fine, wholesome little centerboard boat, of good dimensions and model, and durable construction, and several were built by the boat company; only one, however, was finished and sold. If the cup has to be defended next year under existing conditions, it will be necessary to build a fleet of machines more expensive, more extreme in design and even less useful and durable than the boats of this year, and this can only be done by means of syndicates. The comparatively large fleets of 1896-97 were built willingly by individual members for the sake of the racing, the four boats of this year were built, not because anyone wanted such craft, but because it was necessary to make a creditable defense of the cup.

The work of winning and defending the cup thus far has been possible only through the aid of Mr. Duggan, who has designed the winning boat for three years, and the majority of the trial fleet of each year, and who has sailed the two Glencairns and Dominion to victory. In addition to this, Mr. Duggan has practically built most of the boats, he, with two others, assuming the work and responsibility of carrying on the small shop at the club station for the sake of having the work done under their immediate supervision; there being no builder near Montreal who can do this class of work.

While the club has done its part of the work, and many individual members have given their time and money freely to help in the designing, building and racing, at the same time the greater part of both labor and responsibility has naturally fallen on Mr. Duggan. Three years of the winter routine of designing followed by a summer of hot racing, in addition to the demands of a large business, have told on him to such an extent that it was a question whether he could sail the present series of races; and it is quite evident that a fourth year of the same double work must involve a very serious risk to his health. It is his intention to abandon all designing save, as he originally took it up, as a diversion and a rest from other business. There is in Canada no professional designer, and the few amateurs other than Mr. Duggan are not fitted either by experience or location to take his place in the defense of the cup.

There was, of course, no desire on the part of any of the holders to be beaten this year, either in designing or sailing; but at the same time, had the cup been lost after a good fight, any possible regret over defeat would have been well tempered by a feeling of relief that the club was now free to go on with the very necessary work of building up a fleet of useful boats. With this in mind, many members would have been quite willing to risk the possession of the cup on a new series of races between Speculator and Challenger, and this feeling had much to do with the proposal of the sailing committee, which will be acted on by the club at a special meeting on Sept. 2, to return the cup to the Seawanhaka C. Y. C.

While there was no lack of appreciation of the intent and the full force of the orders from New York, and of the interviews in the names of yachtsmen from the States, the feeling on the part of the leading men of the Royal St. Lawrence Y. C. at the time of the meeting of the sailing committee on Aug. 19 was simply one of regret that the amicable relations between the two clubs should be thus severed. As far as the offer to return the cup is concerned, it was made in good faith and a spirit of friendliness. It was fully recognized that, for the reasons stated, the holders were not in a position to defend the cup next year without detriment to their own interests, and also that the material revisions of the conditions which are now imperative could not well be done by correspondence or by means of brief conferences in New York or Montreal. Under these circumstances it seemed best to return the cup to the original donors in order that they might, unhampered, amend the terms of the trust to meet the necessities of the future so far as they can be foreseen.

In addition to the challenge from the Inland Lake Y. R. A., made to the Royal St. Lawrence Y. C., the Victoria Y. C., of Hamilton, has announced its intention to challenge for the cup, if it is again held by the Seawanhaka C. Y. C. This announcement was made by Com. Frank E. Walker, V. Y. C., at the close of the Lake Skiff Sailing Association meet on Aug. 22. Com. Walker, it will be remembered, challenged for the cup in 1895, immediately after the Royal St. Lawrence Y. C., the latter taking precedence.

The "Dresser and Kerr" telegram has been published widely in the daily papers, evoking some very severe criticisms against the Seawanhaka C. Y. C. A good many different statements have been made as to the action of the representatives of the club in obedience to the orders of Messrs. Dresser and Kerr. After the receipt of the telegram Mr. Crane and his immediate party left the club house and dined at the Forest and Stream Club, about half a mile away, where they took their meals frequently while at Dorval. Mr. Crane was taken ill during the evening; after dinner he returned to the club house and retired; none of his party were present at the dance on the lawn or the supper in the club house. It has been stated that Mr. R. W. Gibson deliberately insulted the club by refusing to attend the dinner; this is not true, as Mr. Gibson, before he started for New York on Thursday morning, wrote a polite letter of declination, stating that he was unable to remain over another night.

The comments of the daily papers throughout the country have been confined mainly to two points, the condemnation of the Royal St. Lawrence Y. C. for racing a catamaran, and a very severe condemnation of the Seawanhaka C. Y. C. for its discourteous action on losing, based on the "Dresser and Kerr" telegram. It is not clear who first started the cry of "catamaran," but, once started, it was taken up on every hand, without the slightest attempt to ascertain whether or no it was true. This was natural enough on the part of the average small newspaper, but it is very little to the credit of the larger journals, especially those of New York, which pretend to speak with authority in yachting matters. The New York papers sent no representatives to Montreal, and took all their information at second hand, making no attempt whatever to determine fairly the nature of Dominion. They raised a hue and cry that has spread all over the country, the Canadians being prejudged in a most unjust manner. With the true spirit of Rip Van Winkle, they have ignored all progress, and have judged Dominion by the standards of twenty-five years back. The Seawanhaka race committee has apparently followed the same course, acting

without definite information as to the much-disputed boat. In its various reports on measurement and the tendencies and developments of modern racing within the past two years, this same committee has fully demonstrated its ability to handle all the technical yachting questions of the day; and yet in this, a purely technical question, it has taken a position which cannot possibly be maintained.

While practically all of the papers in the States maintain that Dominion is a catamaran, and condemn the Montreal men on her account, they are equally severe in the condemnation of the Seawanhaka C. Y. C. after agreeing to start in the first race. The Canadian papers have been very moderate in tone in discussing the famous telegram, but one Montreal weekly, the so-called "society journal," has indulged in a very violent personal attack on Mr. Duggan, which has been reprinted in many papers on this side. This paper has been particularly hostile to Mr. Duggan for some time, in fact, prior to last year's races; and the personal animus of the writer is evident throughout.

As to the prospects of a race next year, assuming that the present differences will be amicably adjusted, it is impossible to speak at present. It is very doubtful whether Mr. Duggan will take part in any event, and he certainly will not take the same prominent part as in former years. One of his trusted lieutenants is said to be on the verge of matrimony, so that he is not likely to figure prominently in cup races. Mr. Linton Hope, who has long been looked upon as a probable challenger, has just been married, which is likely to have an effect on his plans. The present size and type of yacht are in every way undesirable; the boats are costly and utterly useless, and they require a comparatively large force of men to sail and handle them in proportion to the 15-footers. In these latter the crew of two could readily look after the boat with little assistance, even carrying her up on the beach. In the 20-footers four are required for the crew, and this year each boat had two professionals in addition to attend to her. If the racing for the cup is to continue, some very radical changes must be made in the conditions, and the present type and probably the size as well will have to be abandoned.

Inland Lake Yachting Association's Annual Meeting.

White Bear Lake, Minnesota.

Held under the Auspices of the White Bear Y. C., St. Paul, Minn.

It has been the writer's good fortune to be present at the races held at White Bear Lake, Minn., and it may be of interest to Eastern yachtsmen to know something about the type of boat prevalent in the West, and the conditions of wind and water under which the races were sailed.

In the first place, it seems to your correspondent a fact worthy of note, and one of which Westerners have good reason to be proud, that on a little inland lake, two miles by three in size, there should be gathered together such a goodly number of fast boats. The fact that Akela, the Western champion 23-footer, should have been able to make so excellent a showing against a boat of Hoodlum's quality and reputation goes to prove that the Westerners are not one whit behind us in yacht designing.

Akela is of a more advanced type than Hoodlum, and although she was beaten, there was a great deal of luck in the races. She certainly demonstrated her ability to beat Hoodlum soundly in a reefing breeze, and she was herself as soundly beaten in light air. It is a very regrettable fact that there was no chance to sail the boats together in a moderate whole-sail breeze. The 20-footers, particularly those from Minneapolis and St. Paul, were of a modern type, and I am inclined to think that if they were pitted against the Seawanhaka boats the result might surprise some Easterners. The same can be said of the 17-footers.

White Bear Lake, on which these races were sailed, is a charming spot. The shores are wooded, and the little island, connected by a bridge with the mainland, is dotted with pretty cottages, among trees and green lawns, sloping to the water's edge.

The club house is situated on the beach not a hundred yards from the railway station, from which trains take one to St. Paul in half an hour, thus making it easy for the tired business men to come out for an afternoon sail.

The races were sailed over the following courses: Starting at the Clarke street buoy, just off the club house, one sails due east to the center buoy, thence north to a mark in Dellwood Bay, thence back to center, thence east again to a mark at Wildwood, thence west back to center, thence to the finish line, and repeat, making in all twelve nautical miles, each leg being one mile in length. The prevailing wind was west, making four legs of running, four of reaching, and four of windward work.

Before entering into a description of the races, it might be interesting to glance over the facts which brought them about. The Inland Lake Yachting Association was formed last year. The yacht clubs which sent representatives this year were the Oshkosh, Indiana, Minnetonka, Fox Lake, Pistakee and White Bear. Each of these clubs sent a 20-footer to represent them in the races, and three had 17-footers as well. Mahto, the winning boat of the 20ft. class, is perhaps the fastest-looking boat of any in the fleet. She was designed by Gus Admundson, of White Bear Lake. She is 32ft. over all, with about 9ft. beam; her sailing length under the Seawanhaka Corinthian rule being 20ft. She is of the scow type, not unlike Akabo, except that she has not the peculiar chopped-off bow of that boat. She is very shoal and has not too much freeboard, the prevalent fault of the Western boats. She carries 500sq.ft. of Union silk sail, made by Wilson & Silsby. She has a steel dagger centerboard weighing about 125lbs. Hazard, her nearest competitor, was designed by Andrew Peterson, of Lake Minnetonka, and is much like Mahto, except that she is a bit narrower and has a good deal more freeboard. These two boats are very even, and Mahto's victory was as much due to the manner in which she was handled as to anything else.

Of the 17-footers, Xenia, also designed by Admundson, was rather the best. She is very much like Mahto, on a smaller scale, having a bit less beam and being not quite so full forward in proportion to her length.

We're Here, designed by Com. Hopkins, of the Minnetonka Yacht Club, is of such peculiar construction that she is worthy of mention. She has no planking at all, her ribs being 2in. wide, spaced 5in. on centers and then covered with canvas, so that she is in reality nothing but a big canvas canoe. She was very fast in heavy weather, though hardly Xenia's equal. So much for the regular interlake classes.

The race in which the greatest interest was taken was that between Akela, last year's Western champion, and Hoodlum, the champion of the Yacht Racing Association of Massachusetts. Early in June a challenge had been sent by this Association to the White Bear Y. C. asking for a race late in August between Hoodlum and any representative they might see fit to name. Akela, the Western champion, was designed by Andrew Peterson, of Lake Minnetonka. She is 36ft. over all, 21ft. 4in. under the rules of the Y. R. A. of Massachusetts, and has an extreme beam of 9ft. 4in. She is of the scow type, though not so well developed as Mahto. Her stern is rather coarse, having in it the cleft peculiar to Peterson's boats. What this cleft is for no one knows, not even Peterson himself, and it certainly does the boat more harm than good.

Akela carries 734sq.ft. of sail, and has a dagger centerboard weighing about 300lbs. She was sailed during the races by her owner, Mr. C. Milton Griggs, of St. Paul, who had as his crew Andrew Peterson, her designer; John Bunn, Samuel Bunn, Daniel Bunn and John Johnson.

Hoodlum was designed by John R. Purdon, of Boston, and built by Fenton & White, of Manchester, Mass. She is 32ft. over all, 23ft. under the rule of the Massachusetts Y. R. A., and has an extreme beam of 8ft. 4in. Her type is too well known to need description. She carries a wooden centerboard with no weight in it, and has 766sq.ft. of sail. She was admirably sailed in the races by Mr. Ward C. Burton, with a crew composed of H. J. Burton, Herbert Dyer, Robert Schuck, A. W. Strong, and A. H. Higginson. The result of the match was in a great measure due to the way in which Hoodlum was handled. Her crew were well trained, and, except on the first day, made no mistakes. Mr. Burton took her across the line first on all the days except one, and clearly outgeneraled Mr. Griggs at the start. It is much to be regretted that two of the races were sailed under unfavorable circumstances; an accident marring the one, and a foul the other.

The Trial Races.

A series of trial races was sailed at White Bear Lake to see what boat should defend the honor of the club against Hoodlum, the champion of the Yacht Racing Association of Massachusetts of last season. Two boats—Aurelia and Akela—showed up to compete for the honor of racing the Eastern boat.

Both are of the scow type, Aurelia being rather more extreme in this matter than Akela. Aurelia was designed by Gus Amundson, of White Bear, Minn. She is owned by Mr. W. B. Dean, of St. Paul. She is 32ft. over all, 23.3ft. waterline with crew on board, 10ft. extreme beam. She carries 778sq. ft. of sail in her mainsail and working jib. She carries her beam on deck very far forward, having a beam of 9ft., 3ft. forward of her mast, then being drawn in quickly on deck, forming a dull V-shaped bow. Her waterline at the bow is absolutely square for 6 or 7ft., forming one of the flattest bows I have ever seen. Her stern is rather coarse, being brought up too suddenly. The impression she makes on one is that if her lines were carried further forward and aft she would be a faster boat.

Akela, on the other hand, although she is also of the scow type, is much finer both forward and aft, being made so by having her lines carried out further in a more natural manner. She has 8in. less beam than Aurelia, is 4ft. longer over all, and 9in. longer on the waterline. She has a lower rig, with less in her mainsail and more in her jib than her rival, her total sail area being 734sq. ft. She was designed by Andrew Peterson, of Lake Minnetonka, and is owned by C. Milton Griggs, of St. Paul. Both boats have sails made by Wilson & Silsby, of Boston, and both carry steel dagger centerboards.

First Race, Aug. 18.

Course 3 miles; second leg to windward. Breeze light and fluky. Preparatory signal at 3:30 P. M.; starting signal at 3:35, 5 minutes being given in which to cross the line. This method was adopted so as to get a test of the merits of the boats rather than of the capabilities of their skippers.

Akela crossed the line at 3:37:35, followed by Aurelia at 3:39:20. On the reach to the first mark Aurelia picked up a little on her rival, their times at the first mark being: Akela 3:56:40, Aurelia 3:58:00. Both boats flattened their sheets for the beat to the second mark. Akela soon tacked to starboard, while Aurelia held on for some time before tacking, seeming to gain a bit by this maneuver. The times at the second mark were: Akela 4:15:30, Aurelia 4:15:55. Both boats broke out balloon jibs on the reach home, as the wind had come out a bit ahead, not allowing them to carry any spinakers. Aurelia just held her rival, the times at the finish being: Akela 4:29:30, Aurelia 4:29:55. The summary:

	Start.	Finish.	Elapsed.
Aurelia	3 39 20	4 29 55	0 50 35
Akela	3 37 35	4 29 30	0 51 55

It being still early, the judges started a second race at 4:35.

Second Race, Aug. 18.

Course three-quarters of a mile to windward and return. Preparatory 4:35; start 4:40. Akela crossed with flash of the gun at 4:40, followed 1m. 23s. later by Aurelia. On the beat to windward Akela gained on her rival, their times at the mark being: Akela 4:59:30, Aurelia 5:01:32. On the run home, however, Aurelia's spinaker seemed to draw better than Akela's, and she greatly cut down Akela's lead. When the times were taken at the finish it was found that Aurelia had won again, though by a narrow margin. The summary:

	Start.	Finish.	Elapsed.
Aurelia	4 41 23	5 13 22	0 31 59
Akela	4 40 00	5 12 35	0 32 35

Third Race, Aug. 18.

Preparatory signal at 5:10; start at 5:15. Course 2½ miles. First leg close reach; second and third legs broad reaches. Aurelia got away at 5:19:10, followed by Akela at 5:20. This was a most uninteresting race, as the boats did not tack once around the course, except at the marks. As can be seen from the times Akela made slow but steady gains, finally getting a lift of wind and passing Aurelia just before the finish. The times:

	Start.	First mark.	Second mark.	Finish.	Elapsed.
Akela	5 20 00	5 32 18	5 46 47	5 56 44	0 36 44
Aurelia	5 19 10	5 31 06	5 46 21	5 57 01	0 37 51

Fourth Race, Aug. 19.

Preparatory signal at 11:25; start at 11:30. Breeze light, but steady, increasing later to a fair sailing breeze. Course 5½ miles, third and fourth legs to windward. Akela crossed the line first as usual, her time being taken at 11:32:43, and Aurelia's at 11:33:38. Spinakers were set for the run to the first mark, and in the light air Aurelia's big spinaker gave her a gain of 19s. on her rival. On the next leg Aurelia took in her spinaker and set a balloon jib, while Akela carried hers with the pole slacked away forward. It did her more harm than good, and while she was trying to get it in Aurelia passed her, rounding the second mark a few seconds ahead, and hauling on the wind for the long beat to windward. In this beat Akela retrieved some of her lost laurels, and turned the mark but 12s. behind Aurelia. She could not gain any more on the run home, however, and was still 12s. behind at the finish line. The summary:

	Start.	Finish.	Elapsed.
Aurelia	11 33 38	12 36 32	1 02 54
Akela	11 32 43	12 36 44	1 04 01

Fifth Race, Aug. 19.

Preparatory at 2:35; start at 2:40. Course same as fourth race; wind also the same. Aurelia, sailed by Dr. Archie McLaren, crossed at 2:44:44, with Akela at 2:45. On the spinaker run Aurelia at once began to crawl away from her rival, and at the first mark increased her lead by 15s. In the reach of the next leg Akela, profiting by the example set her by Aurelia in the previous race, took in her spinaker and set a balloon jib. The Aurelia's people had trouble taking in their spinaker, and Akela turned the second mark 38s. ahead. Both boats hauled in sheets for the beat to the Wildwood mark. Akela seemed to hold too close to the south shore of the lake. At any rate Aurelia made a great gain, the times at the mark being: Aurelia 3:47:48, Akela 3:50:30. On the last leg Akela picked up a bit, but could not catch her rival, the times at the finish being: Aurelia 4:02:13, Akela 4:03:27. The summary:

	Start.	Finish.	Elapsed.
Aurelia	2 44 44	4 02 13	1 17 29
Akela	2 45 00	4 03 27	1 18 27

Sixth Race, Aug. 19.

Start at 4:15. Course 5 miles, 2 miles to windward. Wind a little stronger. Akela got away at 4:19:31, followed by Aurelia at 4:19:56. In the long beat to windward Aurelia passed and got to the windward mark a few seconds ahead of Akela. On the next two legs, however, which were off the wind, Akela pulled away from her rival, rounding the third mark about 20s. in advance of her. On the last leg Aurelia got a strong puff of wind, which Akela did not, and as a result finished with quite a little lead. The summary:

	Start.	Finish.	Elapsed.
Aurelia	4 19 56	5 40 00	1 19 56
Akela	4 19 31	5 41 02	1 20 54

The judges—Messrs. Henry Merrill and F. M. Douglas—expressed themselves satisfied, and stated that they would announce their decision at 4 P. M. the next day, when Hoodlum and her competitor were to be measured. Aurelia's crew were feeling very confident of being chosen, while C. Milton Griggs, skipper and owner of Akela, felt very discouraged. He had expected to win. Your correspondent had watched the boats in the races very carefully from Hoodlum, and had formed the opinion that Akela was rather the better boat of the two in spite of the races. He was, however, none the less surprised when the judges announced on Saturday, Aug. 20, that Akela was the chosen boat. In view of the races just held, it did seem a bit hard on Mr. Dean's boat. The judges gave as their reason for the choice that the races had all been in light winds, and that Akela had had hard luck in the matter of wind. They stated that they considered Akela the better all-round boat of the two, and more to be depended upon.

At 4 P. M. Hoodlum went into the measuring dock. Under the rules of the White Bear Y. C. her sailing length is 27ft., and under the rules of the Massachusetts Yacht Racing Association 23ft. Akela was found to measure 25ft. 7in. under the W. B. Y. C. rules, and 21ft. 6in. under the M. Y. R. A. rules.

First Day, Aug. 22.

The first day of the week set for the racing of the Inland Lake Yachting Association was an ideal one from a yachtsman's point of view. In the morning a strong northeasterly wind came in hard puffs across the lake, and under these conditions the first race, the match between Hoodlum and Akela, was sailed. Later in the day the wind lightened, shifting to southwest, and making a fair sailing breeze for the races of the smaller classes in the afternoon. At 10:10 the preparatory gun for the great match was fired. Both boats had two reefs tied down in their mainsails and had on small jibs. The starting gun went at 10:15, and Akela crossed the line almost with the flash of the gun, followed about 5s. later by Hoodlum. Both boats were close hauled on the starboard tack on the close reach to the center buoy. Akela seemed to foot the faster, though Hoodlum pointed higher. The boats were timed at the center buoy as

follows: Akela, 10:29:22; Hoodlum, 10:29:56. Both boats started sheets in the run to Dellwood; Akela set her spinaker, while Hoodlum simply winged her small jib, which apparently helped as much as Akela's spinaker. The time at the Dellwood mark was: Akela, 10:37:03; Hoodlum, 10:37:35. Both boats flattened sheets for the beat back to center. It was blowing very hard, and the boats staggered in the stormy puffs. Hoodlum seemed to stand up the better of the two, and here began for the first time to make a steady gain. She pointed higher than Akela and seemed to foot fully as fast. But a little later an accident happened which marred the race.

Just as Hoodlum was crossing Akela's stern, the lashing at the outer end of Akela's jib pole parted and Akela came up into the wind. Hoodlum sailed by to windward, while Akela kept on under her mainsail as best she could. Capt. Griggs, of Akela, shook out one reef, and set her regular jib instead of the small one, and after that she seemed to go faster. The times at the center buoy were: Hoodlum, 10:54:46; Akela, 10:58:08.

On the next leg, which was a broad reach down to the Wildwood mark, Akela gained on Hoodlum very fast. Your correspondent, who had seen Hoodlum sail in her races in Massachusetts Bay last summer, and had seen her reach by 30-footers with ease, opened his eyes very wide as he saw Akela pick up on Hoodlum. She seemed to be going as fast again, and it was really a sight well worth seeing. Hoodlum was not going slow either, by any means, and it was as wonderful an exhibition of reaching as ever was seen. Hoodlum was standing up too straight; she didn't seem to have sail enough, and Akela with one reef fared much better than Hoodlum with two. The boats were timed at the Wildwood mark: Hoodlum, 11:03:05; Akela, 11:06:24, a gain of about 1m. in about one nautical mile of reaching for Akela. Hoodlum, hard pressed for the first time since she was launched, tried to set her big jib; but her crew made a bad tangle of it, getting it into the water, and nearly losing a man overboard in the operation. It cost Hoodlum some seconds, but hardly counteracted Akela's accident with her jib.

Akela continued to gain steadily, reaching in her own wonderful manner. The time at center was not taken, as the boats did not pass near enough to get the time accurately, but at the end of the first round Akela had reduced Hoodlum's lead to 1m. and 23s. The times at the end of the first round were: Hoodlum, 11:19:00; Akela, 11:20:23.

The wind had shifted by this time from the northeast to almost due east, making a wide reach back to the center buoy, instead of a close one; Akela continued to gain steadily, the times at the mark being much closer than at the end of the first round. Then came another broad reach, Akela continuing to gain. She was cutting down the long lead which Hoodlum had got by her accident at a tremendous rate, and it began to look as if the Boston boat would be beaten before she could cross the line. The times at the Delwood mark were: Hoodlum, 11:34:43; Akela, 11:35:38.

Both boats flattened sheets for the close reach to center again, and on this leg Hoodlum began to gain. Both boats stopped on the way to shake out reefs. Akela was quicker at this than Hoodlum, and gained accordingly. The times at the mark were: Hoodlum, 11:52:10; Akela, 11:53:00. On the next reach both boats had all the wind they wanted, and they made a beautiful picture as they reached along under full sail. At the Wildwood mark the time was taken as follows: Hoodlum, 12:01:27; Akela, 12:01:52.

The boats jibed around the mark and started on the home stretch. In the puffs Akela gained rapidly, and half a mile from the finish line she tried to pass Hoodlum to windward. Finding she couldn't do that, she paid off to leeward, and 100yds. from the line the boats were on even terms, and Akela crossed the line 5s. in advance of the Boston boat. The judges' boat, crowded with Westerners, cheered Hoodlum loudly as she crossed the line. It was a most courteous and polite act, and we Easterners appreciated it. Akela had sailed a very hard and gallant up-hill race, and to her were due the honors of the day. Under the rules of the White Bear Y. C. Akela allowed Hoodlum 14s., the Boston boat thus winning by 9s.

A summary of the race shows that in nine knots of reaching Akela gained 4m. 6s. on Hoodlum, an average gain of 27.3s. per knot, while in two knots of windward work Hoodlum gained, allowing 3m. for Akela's accident, 1m. and 21s. on Akela, an average gain of 40s. per knot. This is interesting as showing Akela's great reaching powers. The official summary:

	Start.	1st round.	Finish.	Actual.	Corrected.
Hoodlum	10 15 00	11 19 00	12 18 17	2 03 17	2 03 03
Akela	10 15 00	11 20 23	12 18 12	2 03 12	2 03 12

After the big match in the morning was over, and the judges had eaten their lunch, they took up their position at the line, and made ready to start the regular interlake races. At 2:10 the preparatory gun was fired for the 20ft. class, and the starting gun at 2:15. The wind had now lightened and shifted to southwest, and the boats all broke out spinakers as they crossed the line. Six 20-footers crossed the line. First came Iota, the champion of Oshkosh, followed by Hazard, the Minnetonka Y. C.'s representative; then came Mahto, the White Bear boat; Gadfly, of the Fox Lake Y. C.; Pistakee, of the Pistakee Y. C., while Monoquet, of the Indiana Y. C., brought up the rear. The order hardly changed on the run down to center, Monoquet running past Pistakee and Gadfly, otherwise the order remained the same. On the windward work, however, the boats began to string out a bit more, Mahto and Hazard, closely followed by Gadfly, ran by Iota. At the Delwood mark Mahto, sailed by Capt. Ordway, had a good lead, and she was never headed again during the race.

From this time on the race lay between Mahto and Hazard, and it was a very pretty one. They were minutes faster than the other boats. All the boats set spinakers on the run to center buoy, Hazard and Mahto struggling for the lead in the van, followed later by Pistakee, Iota, and Gadfly, who were having a good race among themselves. Monoquet brought up the rear. Rounding the center mark the boats reached down to Wildwood at a great rate, the little Mahto still holding her lead in fine style. Astern, Gadfly, Iota and Pistakee were having a very close race, though they were never in it with the leaders for an instant. At the end of the first round the race became a procession, Mahto leading Hazard by a narrow margin at each mark, and the others tailing out well behind, but fighting gallantly for third place. All round the mark the positions never changed for an instant, and the yachts came flying home to the finish line in the same order. Capt. Ordway, of the Mahto, sailed a beautiful race, and his victory was well deserved and hard won. The official summary for the 20ft. class was:

Start, 2:15:00:

	1st round.	Finish.	Elapsed.
Mahto	3 28 57	4 51 02	2 36 02
Hazard	3 30 30	4 52 05	2 37 05
Pistakee	3 34 09	4 57 05	2 42 07
Iota	3 31 27	4 57 17	2 42 17
Gadfly	3 31 50	4 57 44	2 42 44
Monoquet	3 34 25	5 00 39	2 45 39

Meanwhile three 17-footers were struggling for supremacy in the rear. The starting gun had been fired for this class at 2:20. We're Here, owned by Com. Hopkins, of the Minnetonka Y. C., was first across the line, closely followed by El Comancho, of the Fox Lake Club, and Xenia, sailed by Com. Drake, of the White Bear Y. C. The Minnetonka contingent hoped great things of their boat, but they were doomed to disappointment. In the light air We're Here didn't appear to move at all well, in fact she was out of it from the start. It was found later that she had a big bunch of weeds on her rudder, and this doubtless accounted for her bad performance. El Comancho and Xenia both ran by her and had a good fight for first place. El Comancho ran by Xenia on the second leg of the course, and led at the Dellwood mark by over a minute. On the close reach to center Xenia gained again and at that mark was but 16s. astern.

On the run to Wildwood El Comancho pulled away again, and led at Wildwood by 38s. Here, however, she fouled the mark, and knowing that this meant disqualification, she withdrew from the race. After this the race became a procession, Xenia increasing her lead on every leg. So well was she handled that she beat all but the first two of the 20-footers on actual time. She was sailed very well by Com. Drake and a clever crew. The official summary:

Start, 2:20:00:

	Finish.	Elapsed.
Xenia	5 01 48	2 41 48
We're Here	5 10 12	2 50 12
El Comancho	Disqualified.	

The judges for the Hoodlum-Akela match were: C. A. Reed, Dr. Archibald McLaren and F. M. Douglas; the time-keepers were Dr. S. M. Welch, Col. Samuel Appelton and C. H. Taylor.

In the afternoon the judges were Frank Libbey, Oshkosh Y. C.; F. Fayram, Minnetonka Y. C., and W. S. Morton, White Bear Y. C. The timers were William Peet, Minnetonka Y. C.; Geo. Athearn, Oshkosh Y. C., and R. B. de Land, White Bear Y. C.

Second Day, Aug. 23.

The weather on the second day was of a somewhat different nature from the first day's racing. In the morning the wind, though light, held truer than yesterday, and in the afternoon, when the 20-footers and 17-footers sailed their races, it was good for a time, though it flattened too early in the afternoon for the 17-footers to finish.

Promptly on time, the first race on the schedule, that between the Eastern champion, Hoodlum, and Akela, the defender of the White Bear Y. C.'s honor, was started at 10:20. The preparatory gun found both boats maneuvering for the start under whole sail. Hoodlum had on the new suit of sails sent her last week by Wilson & Silsby, of Boston, and they seemed to set to perfection. She seemed to work well in the light air, rather better than in yesterday's knockdown squalls. When the starting gun was fired at 10:25 Hoodlum jibed around the judges' boat, with Akela on her lee quarter a few seconds behind. With her sheets started way off, Hoodlum began at once to forge slowly ahead. It was a wide reach to the center buoy, and the Boston boat, rather to everyone's surprise, pulled out a lead of 32s. on Akela. She seemed to move very fast. Ward C. Burton, who sailed her, had all his men in the cockpit, and not a soul could be seen as she slipped along like a ghost in the light air. Suddenly, as she hauled around the center buoy, men seemed to appear on her deck, and, as she started on the beat to windward, we saw her crew lying along her weather rail. The time at the center buoy was: Hoodlum, 10:35:55; Akela, 10:36:37.

On the wind Hoodlum began to leave Akela in good shape, both outpointing and outfooting her. Akela went fluke-hunting along the island shore, but gained little by so doing. On this leg, from center to Dellwood, Hoodlum gained 28s. on Akela. The boats were timed at the mark as follows: Hoodlum, 11:50:32; Akela, 11:51:32. Both boats jibed around the mark and set spinakers to starboard. The wind was very variable on this run, and the sails had to be taken in and reset several times. At this kind of work Hoodlum's crew were a bit quicker, with the very natural result that at the mark Hoodlum had gained, and added 29s. more to her lead. The time at the mark was: Hoodlum, 10:06:01; Akela, 11:07:30.

Both boats jibed around the mark and promptly set spinakers to port, when they drew well. Akela, however, came up a good deal on Hoodlum with a following wind, and when Hoodlum hauled on the wind for the beat home at 11:25:40 Akela had reduced her lead by 11s., Akela hauled on the wind at 11:26:58. Both boats worked up close under the south shore of the lake, as there seemed to be more wind there than elsewhere. At 11:35:22 Hoodlum stood out from shore on the port tack, followed some minutes later by Akela. At 11:40:12 she tacked to starboard again, making the center buoy on the tack, and passing to windward of it at 11:47:12. Akela passed it at 11:52:19. Then Akela made her greatest gain of the day. She stood far on her port tack, over under the shore of the island, while Hoodlum stood far on, on the starboard. By this move Akela gained 2m. 19s. The boats were timed at the end of the first round, Hoodlum, 12:07:41; Akela, 12:10:19. Both boats reached down to center at a great rate, Hoodlum adding 10s. to her lead. Both boats moved very fast in the freshening breeze. On the close reach to Dellwood Hoodlum made a great gain. She fetched to mark on one tack, while Akela had to make three before she could follow Hoodlum round the buoy. The times at the Dellwood mark were: Hoodlum, 12:34:34; Akela, 12:40:03, a gain of 2:27 for Hoodlum. Both boats set spinakers to port, and Akela set her balloon jib in addition. As the boats rounded the center buoy the wind freshened a good deal, and Akela, carrying her spinaker longer, gained 2:36 on Hoodlum, in time, in distance the gain was not so great. Hoodlum jibed round the mark at 12:47:21, setting her spinaker at once to starboard, Akela followed at 12:50:04, and set her spinaker also to starboard.

The wind had now freshened into a comfortable, wholesail breeze, and both boats sailed fast on the run down to the Wildwood mark. They were timed at the mark, Hoodlum, 12:58:11; Akela, 1:02:48, a gain for Hoodlum of 1:54 in the run from center.

Both boats trimmed down their sails flat for the two-mile beat to windward, and at once Hoodlum began to show her superiority over the Western boat in windward work. She both outpointed and outfooted Akela, and seemed in every way to get the best of her. Ward Burton sent Hoodlum along the south shore for a bit, and then sent her out into the lake for a hitch to westward. Akela hugged the south shore closely, making short tacks to do so. Hoodlum continued to gain steadily, crossing the line at 1:31:57, followed by Akela at 1:41:18. As in the race of Monday, the Minnesota people cheered Hoodlum vigorously as she crossed the line. On actual time, Hoodlum beat Akela 9m. and 21s., and on corrected time 6m. and 24s. The official summary:

Start, 10:25:00:

	1st round.	Finish.	Elapsed.	Corrected.
Hoodlum	12 07 41	1 31 57	3 06 57	3 06 57
Akela	12 10 19	1 41 18	3 16 18	3 13 21

A careful analysis of the race shows that in three nautical miles of reaching Hoodlum gained an average of 1m. and 3s. per mile. In four miles of running Akela gained a total of 24s., making an average of 6s. per mile, while in windward work Hoodlum made an average gain of 1m. and 20s. per mile. Hoodlum clearly demonstrated her ability to beat Akela in light airs. The officials in charge of the race were the same as yesterday.

The preparatory gun for the 20-footers was fired at 2:10. The entries in the class were the same as yesterday. The wind was blowing about six knots per hour; the starting gun was fired at 2:15, and Mahto, again sailed by Capt. Ordway, got away a length in advance. She was followed by Iota, the Oshkosh champion, who was in her turn slightly in advance of Hazard, Pistakee, Gadfly and Monoquet. The two latter were badly handicapped at the start, and lost about 3m. by getting into a luffing match with each other. All the boats set spinakers on the run to center, and when the mark was reached Mahto had a good lead on the others. Hazard had passed Iota, and otherwise the order remained unchanged. The times at the center buoy were:

Mahto	2 31 54	Gadfly	1 33 35
Hazard	2 32 35	Pistakee	2 33 27
Iota	2 32 09	Monoquet	2 36 06

The boats reached down to the Dellwood mark in the freshening breeze, Hazard gaining on Iota, but neither of them cutting down Mahto's lead. Rounding the Dellwood mark, Mahto continued to increase her lead till, at center, she had 2m. to the good. The breeze had now freshened till it was blowing about ten knots an hour, and the little boats staggered up to Wildwood under full sail, spinakers set to port. Mahto gained 30s. more. On the beat back to center Iota passed Hazard to windward, while Pistakee and Gadfly picked up a good deal on the leaders. Mahto simply outclassed the rest of the fleet, and on the beat from center to Clarke street she gained even more. The elapsed times at the end of the first round were:

Mahto	1 19 05	Gadfly	1 23 29
Hazard	1 22 26	Pistakee	1 24 25
Iota	1 23 20	Monoquet	1 27 58

All the boats set their spinakers for the run to center. The order remained unchanged until the Dellwood mark was reached, and then Pistakee passed Gadfly and ran up a bit on Hazard, who had been passed by Iota. The wind was flattening, and it required Capt. Ordway's best efforts to get to the line inside the time limit. The boats drifted in slowly, the times hardly giving one a fair idea of the distances between them. It was an unsatisfactory race, although Mahto deserved the victory she had won. The official summary for the 20-footers was:

Start, 2:15:00:

	1st round.	Finish.	Elapsed.
Mahto	3 34 05	5 27 45	3 12 45
Hazard	3 36 52	5 34 01	3 19 01
Iota	3 38 20	6 05 03	3 50 03
Gadfly	3 38 29	6 05 18	3 50 18
Pistakee	3 39 35	6 11 30	3 56 30
Monoquet	3 42 48	6 21 43	4 06 43

The 17-footers started at 2:20. We're Here, sailed by Com. Hopkins, of the Minnetonka Y. C., got away first, followed by Xenia and El Comancho. In the fresh breeze We're Here pulled out a good lead, and at Dellwood was a minute and a half ahead. On the reach back to center she increased the lead by 30s. Well astern Xenia and El Comancho were fighting for second place. At the Wildwood mark the Minnetonka boat had gained still more; but on the beat back to Clarke street both Xenia and the Fox Lake boat succeeded in outsailing her.

At the end of the first round Xenia led. Thirty-four seconds astern came El Comancho, who in her turn was as much ahead of We're Here. On the second round the race degenerated into a drift, the boats not finishing inside the time limits, much to the disappointment of the Fox Lake contingent, whose boat would have won had she crossed the line somewhat sooner.

Third Day, Wednesday, Aug. 24.

Much the same conditions prevailed to-day as in

Monday's race. The wind was perhaps a little lighter, blowing about twelve knots. The special race between Akela and Hoodlum started at 10:25. Both boats had single reefs in their mainsails, and No. 1 jibs. Hoodlum led over the line by about 1s., and during the first knot of the race the two boats, Akela with spinaker set and Hoodlum with jib winged, sailed side by side. Just before reaching the buoy Akela took in her spinaker, while Hoodlum hung on to her jib 2m. longer before swinging it back on to the bowsprit.

Akela's crew were slow with the spinaker, and the combination of circumstances gave Hoodlum a lead of 6s. at the mark. Both boats reached to Dellwood with sheets well started; Hoodlum under working sails, Akela with her balloon jib set. Hoodlum gained 10s. more, both boats jibed round the buoy and started back on the reach to Dellwood.

Akela still stuck to her balloon jib, which seemed rather to overpower her. At times she laid over very badly. At the center buoy Hoodlum had gained 3s. more. On the run to Wildwood she again winged her jib, while Akela came down after her under balloon jib and spinaker. Hoodlum seemed to hold her own and at the Wildwood mark was 20s. ahead.

Knowing Hoodlum's great windward qualities, I expected to see her walk away from Akela, as she had done the day before; but the boats had hardly made one tack when I saw that Akela was getting the best of it. She sailed through Hoodlum's lee, came about, crossed her bow, tacked again, and walked right away from her. Hoodlum pointed higher, but when the puffs struck her she seemed dead and loggy. Akela only went the faster, the harder it blew. It was a sad sight for an Easterner, but Hoodlum was as clearly outclassed as Akela had been on the day before.

Hoodlum fell steadily astern. When the time was taken at the end of the first round Akela had a lead of 2m. and 47s. The times at the end of the first round were:

Akela.....11 21 22 Hoodlum 11 24 13

Akela set her spinaker, but Hoodlum gained 16s. on her run down to the center, which was owing to carelessness in setting Akela's spinaker.

Akela made the next two reaches without her balloon jib, and the difference was very noticeable; she made substantial gains on both legs, and on jibing round center had a lead of 3m. and 7s. on Hoodlum. Hoodlum was a badly beaten boat, and her crew knew it. They had one chance—if the wind lightened, they might yet beat Akela. So they shook out the reef in her mainsail, but it did not lighten, and while Akela was coming up to windward in fine style, Hoodlum came staggering along, rather overpowered by her big mainsail. Akela romped away from her, beating her as badly as she had herself been beaten on the previous day. Akela crossed the finish line at 12:30:40. The people on shore cheered, the people in the boats cheered, the whistles blew, and the guns fired. The Westerners were so pleased that when Hoodlum came staggering across the line at 12:37:03 they cheered her almost as loudly as they did their own victorious boat.

Hoodlum was beautifully handled, for it took a clever crew and skipper to bring her up to windward with her full sail. Hoodlum had no excuse to offer; she was simply outclassed in the heavy weather. The official summary:

Start, 10:25:00:

	1st round.	Finish.	Elapsed.	Corrected.
Akela	11 21 22	12 30 40	2 05 40	2 05 32
Hoodlum	11 24 13	12 37 03	2 12 03	2 12 03

The analysis shows that in four miles of reaching Akela's average gain was 5s. per mile. In four miles of windward work, 1m. and 35s. per mile. In running the boats were even.

The starting gun of the 20-footers was fired at 2:15. All the boats crossed within 20s., making as pretty a start as one often sees. The boats crossed in the following order: Hazard, Pistakee, Iota, Mahto, Gadfly and Monoquet. The boats raced down to center in the fresh breeze, all of them with a smother of foam under their lee bows. The times at center were:

Hazard .....2 23 28 Mahto 2 24 10
Iota .....2 24 00 Monoquet 2 24 28
Gadfly 2 24 08

Rounding the center buoy the boats started close hauled for Dellwood, and Mahto gained a little on Hazard. Monoquet, with one reef tied down, had passed Pistakee. The boats jibed round the mark as follows:

Hazard .....2 32 06 Gadfly 2 32 16
Mahto .....2 32 25 Monoquet 2 33 36
Iota .....2 32 50 Pistakee 2 33 38

The next leg, which was a run to center, was quite exciting. Hazard and Mahto, as in the previous races, outclassed the fleet, while the others had a good race between themselves. Before the turn was made Pistakee had come up into fourth place, jibing close behind Iota. The boats set their spinakers on their run to Wildwood, and Hazard made a slight gain over Mahto. In the second division of the 20-footers Gadfly passed Monoquet, otherwise the order remained unchanged. The boats were timed round Wildwood as follows:

Hazard .....2 46 38 Pistakee 2 50 27
Mahto .....2 47 23 Gadfly 2 51 18
Iota .....2 49 08 Monoquet 2 51 21

From Wildwood there was a two-mile beat back to the starting line at Clarke street. In the stiff breeze it was wet work for the little boats, and Capt. Ordway, of the Mahto, drove his boat up to windward in a relentless manner. Capt. Pillsbury, on the Hazard, did his best, but it wasn't good enough; Mahto passed him and pulled out a little lead into the bargain, while Monoquet came fast enough to put herself in third place. The times at the end of the first round were:

Mahto .....3 18 56 Pistakee 3 25 22
Hazard .....3 19 18 Iota 3 25 26
Monoquet .....3 25 21 Gadfly 3 33 35

Once off the wind again, Hazard began to gain; foot by foot she pulled up on the White Bear competitor, but she couldn't get by her, and when the boats turned center Mahto still led by 2s., which she increased to 32 when the Dellwood mark was reached. Eight minutes astern Pistakee, Iota and Monoquet rounded within 32s. of each other, while Gadfly labored far behind. Mahto continued to gain, and when the time was taken at Wildwood she was 1m. and 9s. ahead of Hazard—a lead which she increased 2m. and 33s. at the finish. The official summary:

Start, 2:15:00:

	Finish.	Elapsed.
Mahto	4 28 00	2 13 00
Hazard	4 30 33	2 15 33
Monoquet	4 38 53	2 23 53
Iota	4 39 03	2 24 03
Pistakee	4 41 28	2 26 28
Gadfly	4 55 00	2 40 00

The result of this race was that Mahto was awarded the championship cup of the 20ft. class. She deserved her victory, and was handled in a most skilful manner by Mr. L. P. Ordway, who had as his crew W. J. Murray, I. E. Ramaley and C. A. Reed.

Hazard, sailed by Mr. Alfred F. Pillsbury, who had as his crew W. D. Morse, Daniel Raymond and A. Wilcox, was awarded the pennant for the second best boat.

The starting gun for the 17-footers was fired at 2:20, all crossing within 10s. of each other, Xenia in the lead. We're Here undertook to pass Xenia on the run down to center, and Xenia's skipper claimed that a foul occurred, and protested accordingly, but the protest was not allowed. Shortly after this Xenia's spinaker broke and she was handicapped during the rest of the race by the loss of that sail. Times at center were:

We're Here .....2 29 15 Xenia 2 29 46
El Comancho 2 29 33

We're Here continued to run away from her competitors on the reach to Dellwood, and Xenia passed El Comancho. Times at Dellwood were:

We're Here .....2 37 49 El Comancho 2 39 45
Xenia 2 38 36

We're Here continued to gain; Xenia ran away from Monoquet, who was entirely overpowered by the heavy breeze.

After this it was a procession all the way round the course. Xenia went better to windward than her competitor, but her mast was badly sprung, and her skipper was unable to do her justice on that account. The times at the finish were, for the 17ft. class:

Start, 2:20:00:

	Finish.	Elapsed.
We're Here	4 48 54	2 28 54
Xenia	4 50 26	2 30 26
El Comancho	5 01 41	2 51 41

The same officials presided over this race as on the previous days.

Fourth Day, Thursday, Aug. 25.

The conditions on this fourth and last of the races were about the same as on the third. The wind was not blowing quite so hard, but both the 23-footers had single reefs in their mainsails, though the 17-footers sailed under full sail.

Akela had on a larger mainsail than on the previous day, and in consequence her sail area was about the same as Hoodlum's. The big match was started at 10:25, and Hoodlum led over the line by about 20s., breaking out her spinaker as she crossed. Akela got into a good deal of trouble with her spinaker, but in spite of this gained 14s. on Hoodlum, and jibed round the center buoy close behind her.

Both boats started on the reach to Dellwood, and Akela ran up rapidly, attempting to force a passage to leeward of Hoodlum, and thus get the inside track at the mark, which was to be left to starboard.

But she wasn't quite fast enough to do this; Mr. Griggs evidently thought his best chance was to go by Hoodlum to windward, and attempted to do so. It was quite evident that Mr. Burton could have stopped him from doing this, had he wished to, for he didn't even luff with Akela.

The boats were now nearing the buoy. Hoodlum, as Mr. Burton had calculated, had about a half length of overlap on Akela at the mark. Of course, Akela should have given her room, but she didn't, and Hoodlum, in trying to keep clear of her, not only struck the mark, but also ran her bowsprit 4in. into Akela's side, just aft of the mast. The boats were coming very fast, and the collision was a hard one. Hoodlum got clear, holding her sheets, and sailed on, while Akela, instead of following her, paid off and went ashore to repair her damage. Hoodlum sailed the course alone, crossing the finish line at 12:39:10. She broke her tiller square off one mile from the finish, and had to be sailed to windward by her jib.

When the boats came ashore, Mr. Griggs was asked for his statement of the facts. He said: "If Hoodlum had jibed sooner, it would not have happened. When I jibed my boat she came back very fast. I shall not file any protest. I am done sailing. Burton did not intend to hit me, I am sure of that, and both he and Higginson are all right, but I wish their main sheet man had jibed sooner." In answer to this statement, Mr. Burton said: "We had the inside course for the buoy at Dellwood. Akela had the windward position, coming to the buoy. When the boats jibed Hoodlum was to windward, and had an overlap. Akela should have given us room to get around the mark. That she did not do. We jibed as quickly as we could, but struck her, and trying to keep clear of her, we fouled the mark."

Such was the accident which marred the last day's racing. Hoodlum was in the lead when it occurred, though it is doubtful whether she could have kept it.

The 17-footers sailed a final race this morning, Xenia winning over We're Here and El Comancho. The starting gun was fired at 10:30 A. M. All the boats crossed the line at about the same time, with El Comancho slightly in the lead. Just after crossing the line We're Here broke her spinaker pole. Both El Comancho and Xenia passed her. The times at the center buoy were:

El Comancho .....10 39 25 We're Here 10 40 05
Xenia 10 39 43

When the boats rounded center for the second time and started for the run to Wildwood, Xenia was leading the Minnetonka boat by 1m. 31s., while We're Here was in her turn as far ahead of El Comancho. Just after rounding Wildwood, We're Here broke her jib halyard and lost a minute and a half. On windward work Xenia outsailed We're Here badly, and at the Clarke street buoy had a lead of 6m. and 13s. On the runs and reaches which followed We're Here made good gains on Xenia, but she lost again badly in the beat to windward, and at the finish she was 6m. and 20s. behind the White Bear boat.

The official summary:

Start, 10:30:00:

	Finish.	Elapsed.
Xenia	1 01 00	2 31 00
We're Here	1 07 20	2 37 20
El Comancho	1 11 42	2 41 42

This makes two races to Xenia's credit. A third race was to be sailed this afternoon after the writer left. Xenia was sailed in her races by Com. H. T. Drake, who had as his crew F. R. Bigelow and Charles Powers. There has been a strong feeling prevalent among the yachtsmen that next year's races will be held at Lake Winnebago. The races this year have been on the whole quite satisfactory, and Minnesota yachtsmen may well feel proud of their boats, for they carried off first and second honors in all the classes but one, and in that one the defeated boat Akela made an admirable showing.

A. Henry Higginson.

The Quincy Challenge Cup.

The first series of races for the handsome perpetual challenge cup established last winter by the Quincy Y. C. for the 21ft. l.w.l. class of the Y. R. A. of Massachusetts was begun last week, the result of five days' sailing being that each side won two races, and the defender was dismasted, the final race being set for Sept. 1. The challenger, Duchess, representing the Lynn Y. C., is a new boat, designed and partly built by C. D. Mower, head draftsman for Arthur Binney, the designer, and is very similar to the succesful Vitesse, designed, built and raced last year in the 15ft. class by Mr. Mower. Duchess was designed for the 18ft. class, regardless of the Quincy cup, but it was decided to challenge with her; though she was certain to be outmatched to the extent of some 3ft. of length, with no time allowance. As she practically went up into the 21ft. class, she was allowed to carry five instead of four men, and as trimmed for these races she measured 18ft. 4in. She is owned by Charles Hayden. Recruit was designed by J. R. Purdon, and built by the Lawley & Son Corporation for F. B. Rice, commodore of the Quincy Y. C., specially for the defense of the cup; she is of very light construction, and fully up to the 21ft. limit, in fact she has needed alterations to get her safely on the right side of the line.

The conditions call for a series of three out of five races. It was expected that several other boats would enter with Duchess as challengers, but none appeared. The Quincy Y. C. was represented by Secretary J. S. Whiting; the Lynn Y. C. by W. A. Estes, these two choosing a third judge, A. G. McVey. The steam yacht Athlete, A. C. Norcross, was used as the committee boat.

On Monday morning the wind was S.W. and puffy, with force enough to induce the crew of Duchess to tie in three reefs, while Recruit had two, both carrying small jibs. The course was to leeward and return, two and a half miles out, around the red dolphin at Hull, two rounds making nine miles. On board the challenger were Arthur H. Parker, John A. Blanchard, Charles Hayden, E. M. Horton and C. D. Mower. Recruit was sailed by Henry M. Faxon, Arthur Heith, Harold B. Faxon, Frank Crane and J. L. Whiton.

The start was made from the gun at 2:05 P. M., Recruit leading over the line. Duchess, just astern, was quicker with her spinaker. She held close on Recruit's weather quarter over the greater part of the leg, finally turning within 25s. of Recruit. On the wind Recruit began to gain, and showed a lead of over a minute when the first round ended:

Recruit .....2 58 50 Duchess 2 59 53

Spinakers were set for the run out, Duchess gained, and was very close at the turn. As the wind fell a little on the beat home, Duchess shook out her third reef. Recruit followed by shaking out her second reef, but in the hurry one reef point was left tied, and the sail was badly torn. Soon after Duchess shook out her second reef, also tearing her sail, but not badly. Recruit did very poor work with her damaged mainsail, and was badly beaten.

	Finish.	Elapsed.
Duchess	4 00 25	1 55 25
Recruit	4 17 30	2 12 30

After the race the torn mainsails were sent to Wilson & Silsby's loft, being repaired there for the next morning.

The course for the second race was a triangle of six miles, sailed twice. The race was started to windward in an easterly breeze, but by the shifting of the wind to S. and S.W. the three legs were to windward. The start was made at 2 P. M., Recruit going over on time, while Duchess was not near the line, and lost half a minute in the light air. The first leg was a matter of calms and flukes, each going in turn, Duchess having a lead of but 7s. at the first mark. Recruit went ahead and had a lead of 1m. 22s. at the second mark. The wind was now settled at S.W. and steady, just right for a fair trial to windward. Recruit managed to add 1m. 10s., the first round being timed:

Recruit .....3 15 51 Duchess 3 18 23

The second round showed a steady gain for Recruit, the final times being:

	Finish.	Elapsed.
Recruit	4 11 06	2 11 06
Duchess	4 21 38	2 21 38

The course for the third race was windward and leeward, two rounds, making nine miles, with a fresh S.W. breeze. Each boat had two reefs in, but the second reef came out before the start, at 3 P. M. After some quick work Duchess went over just ahead of Recruit, breaking out her spinaker smartly, while Recruit was slow with hers. At the first mark Recruit had a lead of 26s.

Recruit carried her large working jib to windward while Duchess showed a small jib, both being reefed. The first round was timed:

Recruit .....3 43 27 Duchess 3 46 23

DUCHESS—DESIGNED BY C. D. MOWER, 1898.
From Photo by N. L. Stebbins.

On the run Recruit gained but 10s., when they turned, however, Duchess stopped to tie in her third reef, and with but one reef on Recruit she was badly beaten. The times were:

	Finish.	Elapsed.
Recruit	4 29 00	1 29 00
Duchess	4 41 54	1 41 54

On Thursday there was a very light east wind when the race was started at 3 P. M. over a triangular course, Recruit leading Duchess by 8s. over the line. The race was mainly a drift, with the wind shifting to S.W. and falling altogether at times. Recruit finished at 6:31:32, the time limit expiring at 6:30. Duchess finished at 6:32:40.

On Friday there was a fresh westerly breeze, Duchess tying in three reefs, and Recruit two. It was agreed to sail but one round of the six-mile triangle. The start was made at 3 P. M., Recruit leading over the line, and gaining 1m. 30s. on the reach to first mark. This two miles was covered in 11m. 10s., and the next two, also reaching, in 10m. 1s., the mark being timed:

Recruit .....3 21 18 Duchess 3 24 42

Both came hard on the wind, and Recruit was easily holding her own, but her mast split below the jaws as she went through a lively sea, and finally broke. Duchess finished at 4:01:26. The next race, probably the final one, will be started at 10:30 on Sept. 1.

Seawanhaka Corinthian Y. C.

Last week was a busy one at Oyster Bay, through the visit of the five one-design knockabouts of the Corinthian Y. C., of Philadelphia, for the series of interclub matches with the Seawanhaka fleet. The racing covered the whole week and a day over, from Saturday to Saturday, the first and last days being devoted to special races, while five days were given to the interclub matches. The visiting fleet was at Oyster Bay on Aug. 19, including Kid, owned by Mrs. Geary, and sailed by Barklee Henry; Fly, owned by Charles Brock and Mrs. Crozier, and sailed by Mr. Brock; Grilse, owned and sailed by Robert Toland; Spider, owned and sailed by Parker Freeman, and Fareeda, owned by Com. Alexander Van Rensselaer and sailed by Charles V. Grant.

The Seawanhaka representatives were: Gloria, owned by J. Rogers Maxwell, Jr., and sailed by J. Frederick Tams; Stella, owned by John S. Hoyt and sailed by J. Sherman Hoyt; Kewaydin, owned by R. C. Wetmore and sailed by R. W. Gibson; Dacoit, owned by H. L. Maxwell, and Tosto, owned by L. M. Scott, each sailed by her owner.

The race of Aug. 20 was over a course from Oyster Bay to Greenwich, where the Indian Harbor Y. C. had planned a clambake and other festivities for the visitors. Com. Rouse offered the cup won by Mistral in the New London race as a prize for this race. The start was made at 10 A. M. in a flat calm, and after drifting all day the yachts gave up and returned to Oyster Bay, only one, Dacoit, making Greenwich at dark.

The first of the interclub races was started on Monday morning over a triangular course off Center Island Buoy, in the Sound. The yachts raced for points, each being credited with the number of boats on the other side which she defeated. The races were in charge of C. W. Wetmore, of the Seawanhaka race committee, assisted by Walter T. Owen and Isaac W. Jeanes, of the Corinthian Y. C., of Philadelphia. The first race was sailed in a fresh westerly wind, the times being:

	Finish.	Elapsed.
Stella, S. C. Y. C.	4 38 44	2 19 44
Dacoit, S. C. Y. C.	4 39 08	2 20 08
Tosto, S. C. Y. C.	4 40 34	2 21 34
Gloria, S. C. Y. C.	4 41 55	2 22 55
Kid, P. C. Y. C.	4 42 54	2 23 54
Kewaydin, S. C. Y. C.	4 43 08	2 24 08
Farceeda, P. C. Y. C.	4 45 17	2 26 17
Spider, P. C. Y. C.	4 45 59	2 26 59
Fly, P. C. Y. C.	4 48 27	2 28 27
Grilse, P. C. Y. C.	4 49 30	2 30 30

Stella, Dacoit, Tosto and Gloria win 5 points each; Kewaydin wins 4 points. Total for Seawanhaka Club, 24 points. Kid wins 1 point for Philadelphia Club.

On Tuesday there was a reefing breeze, and the inside course, starting and finishing off the club house, was chosen, the start being made at 2:05:

	Finish.	Elapsed.
Stella, S. C. Y. C.	3 55 00	1 50 00
Dacoit, S. C. Y. C.	3 57 15	1 52 15
Tosto, S. C. Y. C.	3 57 45	1 52 45
Kid, P. C. Y. C.	4 00 56	1 55 56
Gloria, S. C. Y. C.	4 01 20	1 56 20
Grilse, P. C. Y. C.	4 01 55	1 56 51
Kewaydin, S. C. Y. C.	4 02 27	1 57 27
Spider, P. C. Y. C.	4 02 28	1 57 28
Fareeda, P. C. Y. C.	4 02 33	1 58 33
Fly, P. C. Y. C.	4 02 45	1 58 45

Stella, Dacoit and Tosto win 5 points each; Gloria wins 4 points, and Kewaydin 3 points for the Seawanhaka Club; total, 21 points. Kid wins 2 points and Grilse 1 point for the Philadelphia Club; total, 3 points.

Grand total to date, Seawanhaka Club 46 points, and Philadelphia Club 4 points.

On Wednesday there was a reefing breeze from S.W., and the course was laid out N.N.E., three miles, outside the harbor. Fly lost her rudder at the outer mark on the second round, and was steered home with an oar. The times were:

	Finish.	Elapsed.
Gloria, S. C. Y. C.	5 16 44	2 46 44
Stella, S. C. Y. C.	5 21 17	2 51 17
Kid, P. C. Y. C.	5 22 28	2 52 28
Dacoit, S. C. Y. C.	5 25 55	2 52 55
Fareeda, P. C. Y. C.	5 25 01	2 55 01
Kewaydin, S. C. Y. C.	Disqualified.	
Tosto, S. C. Y. C.	5 28 19	2 58 19
Spider, P. C. Y. C.	5 28 50	2 58 50
Grilse, P. C. Y. C.	5 31 51	3 01 51
Fly, P. C. Y. C.	5 54 43	3 24 43

Gloria and Stella won 5 points each, Dacoit won 4, and Tosto won 3 for the Seawanhaka Club. Total for the day, 17 points. Kid won 3 for the Philadelphians, Fareeda 2, and Spider, Grilse and Fly won 1 each. Total for Philadelphia for the day, 8 points. The total number of points to date won by the Seawanhaka Club in the three days' racing is 63, against a total of 12 for the Philadelphia Club.

On Thursday there was a fresh S.W. wind for the triangular course, the times being:

	Finish.	Elapsed.
Stella, S. C. Y. C.	5 36 23	3 06 23
Kewaydin, S. C. Y. C.	5 37 08	3 07 08
Kid, P. C. Y. C.	5 39 21	3 09 21
Fareeda, P. C. Y. C.	5 41 11	3 11 11
Dacoit, S. C. Y. C.	5 42 30	3 12 30
Tosto, S. C. Y. C.	5 43 18	3 13 18
Spider, P. C. Y. C.	5 45 11	8 15 11
Grilse, P. C. Y. C.	5 45 38	3 15 38

Stella and Kewaydin won 4 points each, and Dacoit and Tosto 2 each for the Seawanhaka Club. Kid and Fareeda won 2 points each for Philadelphia. Total points for the day, Seawanhaka, 12; Philadelphia, 4. Grand total to date, Seawanhaka, 75; Philadelphia, 16.

As Fly was unable to sail, the winning boat of Wednesday, Gloria, was dropped by the Seawanhaka side, making four each.

The last race was sailed on Friday in a light northerly breeze, Fly being repaired and Gloria starting. The times were:

	Finish.	Elapsed.
Kid, P. C. Y. C.	5 11 10	2 51 10
Stella, S. C. Y. C.	5 15 15	2 56 15
Spider, P. C. Y. C.	5 23 22	3 03 22
Dacoit, S. C. Y. C.	5 29 28	3 09 28
Grilse, P. C. Y. C.	5 33 32	3 13 32
Tosto, S. C. Y. C.	5 34 50	3 14 50
Fly, P. C. Y. C.	5 42 32	3 22 32
Farceda, P. C. Y. C.	5 43 43	3 23 43
Kewaydin, S. C. Y. C.	5 44 45	3 20 45
Gloria, S. C. Y. C.	5 45 07	3 25 07

Kid wins 5 points for the Philadelphia Club; Spider wins 4, Grilse 3, and Fly and Fareeda 2 each. Total points for the day for the Philadelphia Club, 16.

Stella wins 4 points for Seawanhaka, Dacoit 3, and Tosto 2, a total for the day for the Seawanhaka Club of 9 points.

The grand total for the entire series, which closed with this race, stands: Seawanhaka, 85, and Philadelphia, 31 points. Of these Stella, leading boat of the Seawanhaka fleet, has won 23 points, and Kid, leading boat of the Philadelphia Club, won 14 points during the series.

In the evening a dinner was served, at which many members and the visitors were present.

The principal event of Saturday was a private match between Norota, D. B. Burnham, and Hussar, J. D. Baird, for a cup costing $100 and a stake of $500 per side. The wind was fresh N.E., and the course was five miles to windward, from Center Island Buoy to a buoy off Shippan Point and return, two rounds, making twenty miles. Norota was steered by D. Leroy Dresser, and Hussar by C. G. Davis. Hussar led over the course, the times being:

	R.M.	Elapsed.	Corrected.
Hussar, J. D. Baird	39.05	3 26 00	3 22 14
Norota, D. B. Burnham	41.84	3 29 40	3 29 40

In the afternoon one of the regular knockabout races was sailed, with thirteen starters, including the five Philadelphia boats. Stella won.

The Lipton Challenge.

The personal representative of Sir Thomas Lipton, Mr. Charles Russell, arrived at Quebec on Aug. 19, and at New York on Aug. 23, being met by two of Sir Thomas Lipton's business representatives, who escorted him to the Fifth Avenue Hotel. During the day he was called on by Secretary Oddie and Treasurer Hurst, of the New York Y. C., and later in the day he visited the club house on Madison Avenue. On the afternoon of Thursday of last week he met at the private office of Com. Morgan those members of the special Cup committee who were in town, Com. Morgan, Secretary Oddie, Treasurer Hurst, and Messrs. E. M. Brown and H. B. Duryea. Gen. Paine, who was appointed, declined to serve. The details of the meeting were not made public, but Mr. Russell brought no formal challenge, merely stating to the committee the general views of his principal.

On Aug. 24 the special committee of the Royal Ulster Y. C., Vice-Com. R. G. Sharman-Crawford, Hon. Secretary-Treasurer Hugh C. Kelly, and Hugh M. McGildowney, accompanied by Mr. Will Fife, Jr., sailed for New York on the Britannic. They will bring the formal challenge, and it is expected that all arrangements will be made for the match.

For some time past Mr. C. Oliver Iselin has been in conference with the Herreshoffs over a new defender, and though the same secrecy surrounds everything as in 1893-5, it is settled that all arrangements have been made to begin work at once on a new boat, to be managed by Mr. Iselin; Com. J. Pierpont Morgan being named as the largest if not the sole owner. Messrs. H. P. Duryea and H. P. Whitney were also in consultation with the Herreshoffs in regard to a second boat, but they have given up the idea, as it is understood that the firm wishes to build but one boat. This boat, which will naturally be an improved Defender, is estimated at costing $120,000, but, of course, anything like official figures are not accessible. It is also arranged that Defender shall be rebuilt, the estimated cost being $25,000, for use in the trial races.

It is reported from the Clyde that Valkyrie III. will be refitted and raced against Shamrock, Sir Thomas Lipton's new boat; and also that the Duke d'Abruzzi, owner of Bona, has placed an order with Mr. Watson for a cutter of the length agreed on.

The popular assumption is that the match will be made between yachts of 90ft. l.w.l., and this will probably be the case in spite of the obvious fact that quite as good sport can be had, with a larger fleet in the trial races and a far lower cost, in yachts of 60 to 70ft. l.w.l.

The Flying Proa.

Hamilton, Ont., Aug. 22.—*Editor Forest and Stream:* I have been much interested in the articles from your correspondents relating to the flying proa, but think there must be a mistake in one of them, where it asserts that the flat side of the hull is on the windward side. Now, as I understand it, the flat side answers the purpose of a centerboard, and could only work as such on the lee side—the outrigger acting as a large hiking board on the weather. Your first correspondent on the subject thinks that the wave action caused by two rounded hulls placed parallel would retard the speed of the craft, but judging by the late Seawanhaka races, the catamaran (for the Dominion was nothing else) did not seem to suffer from this cause.

I think it has been clearly proved that the wave motion is produced, not by the shape of the two hulls, but by the fact that they are generally fixed rigidly together. Mr. Herreshoff, working on this theory, has designed some catamarans with a ball-and-socket joint holding the two hulls together, so that each hull is entirely independent of the other as to the angle at which it is with the surface of the water, allowing each hull to adapt itself to the surface of the wave passing under it, and, of course, holding them always parallel. The result of this is that he has produced a craft for which he claims the high speed of twenty-one miles an hour.

My idea is that if two canoes were joined together in

this way a craft of high speed would result, as an enormous sail spread could be carried with perfect safety. Hoping to see the ideas of many others on this subject in your paper. C. H. HOOPER.

[Our correspondent is in error as to Dominion, as she is clearly not a catamaran, but based on radically different principles. We have received several other letters on this subject, but they require illustrations, which are not yet ready.]

Hudson River Y. C. Annual Race.

New York—Hudson River.
Sunday, Aug. 28.

THE Hudson River Y. C. sailed its annual race on Aug. 28, over its triangular course on the Hudson River, the wind being light from the south. The times were:

	Finish.	Elapsed.	Corrected.
Cabin Sloops—Start 12:10.			
Margaret	5 17 00	5 47 00	4 57 00
Nahma	5 35 00	5 21 00	5 02 20

H. C. Miner	Did not finish.		
C. T. Wills	3 38 00	3 08 00	3 07 00
Millie	Did not finish.		

The winners were Margaret, Zetes, Ethel B., Edna and C. T. Wills. Zetes wins the special cup for best elapsed time, defeating C. T. Wills 3m. and 10s., and Margaret 59m. and 10s.

Up-to-Date Yachting.

IT is evident that the Seawanhaka 20ft. class has no monopoly of the bad features of modern designing. In describing the Quincy cup matches of last week, the Boston Globe says: "Recruit has been brought into the class by pulling her bow upward and thus shortening her waterline forward." Recruit is of very light construction, entirely too light even for one season's races, and has already been rebuilt to enable her to sail this series, for which she was specially built. Of the other boat the Globe says: "Skipper Parker, of Duchess, stated after the race that he did not care to force his boat to-day, as it was a forlorn hope, and he judged it better to reef and come home easy. He wanted to save her for some more races in the 18ft. class, and to push her on the last leg would have strained her considerably."

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter-century.

Fixtures.

Sept. 2.—Chicago, Ill.—Montgomery Ward & Co. live-bird diamond badge contest.
Sept. 3.—Natick, Mass.—Amateur shoot of the Natick Gun Club. On Sept. 5 if stormy. S. Bowker, Manager.
Sept. 5.—Worcester, Mass.—Worcester Sportsman's Club Labor Day shoot; open to all. A. W. Walls, Sec'y.
Sept. 5.—Corning, N. Y.—First Labor Day shooting tournament Rain Makers' Gun Club; targets. Harry J. Sternberg, Sec'y.
Sept. 5.—Newark, N. J.—Forester Gun Club's Labor Day merchandise shoot. John Fleming, Captain.
Sept. 5.—Pawling, N. Y.—All-day shoot of the Pawling Gun Club; targets. Morton Haynes, Sec'y.
Sept. 5.—Woodlawn, L. I.—Labor Day shoot of the New Utrecht Gun Club. E. C. Frost, Sec'y.
Sept. 5.—Schenectady, N. Y.—All-day shoot of the Schenectady Gun Club.
Sept. 5.—Meriden, Conn.—Fourth annual Labor Day tournament of the Parker Gun Club. C. S. Howard, Sec'y.
Sept. 5-6.—Reading, Pa.—Mt. Penn Gun Club's merchandise and intercounty trophy shoot; targets.
Sept. 5-6.—Rock Island, Ill.—Rock Island Gun Club's amateur tournament.
Sept. 6-9.—Kansas City, Mo.—Schmelzer Arms Co.'s fifth annual tournament; targets and live birds.
Sept. 7-8.—Kingston, N. Y.—Tournament of Hudson River League, on grounds of Kingston Gun Club.
Sept. 7-8.—Haverhill, Mass.—Tournament of the Interstate Association, under the auspices of the Haverhill Gun Club. Geo. F. Stevens, Sec'y.
Sept. 7-8.—Sidell, Ill.—Sidell Gun Club's tournament; targets only. H. J. Sconce, Manager.
Sept. 7-8.—Cherokee, Ia.—Second annual tournament of the Cherokee Gun Club. Irving Weart, Sec'y.
Sept. 7-9.—Aledo, Ill.—Aledo Gun Club's amateur tournament.
Sept. 9.—Wellington, Mass.—All-day shoot on grounds of Boston Shooting Association. O. R. Dickey, Manager.
Sept. 13-16.—Detroit, Mich.—Tournament of Michigan Trap-Shooters' League. W. H. Brady, Sec'y.
Sept. 17.—New Brunswick, N. J.—Shoot of the Central New Jersey League.
Sept. 21-22.—Cleveland, O.—Cleveland Gun Club's eighteenth annual tournament. J. R. Donnelly, Sec'y.
Sept. 21-23.—Omaha, Neb.—Fourth annual shoot of the Du Pont Gun Club.
Sept. 28-29.—Bloomfield, Ind.—Bloomfield Gun Club's target tournament.
Oct. 4-6.—Newburgh, N. Y.—West Newburgh Gun and Rifle Association's fall tournament.
Oct. 12-13.—Greensburgh, Ind.—Greensburgh Gun Club's tournament. W. Woodfill, Sec'y.
Oct. 18-20.—Nashville, Tenn.—At Belle Meade Stock Farm; two days targets; two live birds; $500 added. W. R. Elliston, Manager.
Oct. 18-21.—Belle Meade Stock Farm, near Nashville, Tenn.—Two days at targets; two days at live birds; $500 added.
Oct. 18-21.—Baltimore, Md.—Fourth annual fall tournament of the Baltimore Shooting Association; two days at targets, two at live birds. Geo. S. Harrison, Sec'y.

1899.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication n hese columns, also any news notes they may care to have printed. Tiee in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

A three days' tournament will be held at Morgan's Grove, Sept. 6, 7 and 8. Morgan's Grove is reached from Baltimore and Washington by B. & O. R. R. to Shenandoah Junction, W. Va. It is five miles from the latter city, on the line of the N. & W. R. R. Co. The tournament is held in conjunction with the Morgan's Grove County Fair, and has been largely attended by local shooters, and also shooters from the adjoining counties and States. There are seven events on the first day's programme, four at 10 and three at 15 targets, 50 and 75 cents entrance. Second day, two events, 10 targets each $1; three at 15, each $1.25; four at 20, each $1.50; one three-men team race, 20 targets, $3 per team; one at 25 targets, for Morgan's Grove Fair trophy, open to all. Third day, five 15-target events, of which one is $1, the rest $1.25 entrance; three 20-target events, each $1.50; one at 25 targets for silver cup, open to residents of Jefferson and Berkely counties, W. Va., and Washington and Frederick counties, Md. Mr. J. W. Pentz and Dr. J. P. Bishop, Managers.

Mr. Ralph L. Trimble, of Covington, Ky., informs us that he is no longer a representative of the Du Pont and Hazard powder companies, and that his release was occasioned by the companies having completely retired from the sale of loaded shotgun ammunition, which formed the basis for introducing those brands of smokeless powder into localities where not an ounce of anything excepting black powder had been used. Mr. Trimble was under the jurisdiction of R. S. Waddell, agent, and traveled through the Central and Southern States. He is thoroughly familiar with the trade and has a very large personal following. He is a first-class shot and has had a number of years of practical business experience among sportsmen of Ohio, Indiana, Michigan, West Virginia, Kentucky and Tennessee.

The Labor Day tournament of the Parker Gun Club, Meriden, Conn., is open to all, and has a programme of ten events, seven at 15 targets, $1.30 entrance; two at 20 targets, $2.40 entrance, and one at 30 target, $2.60 entrance, a total of $16.50 entrance for the entire programme. To the first high gun, first, second and third low guns, $5 each, shooting through the programme. Programme events begin at 9:30. Four moneys, divided by the Rose system. Targets 2 cents, included in all entrances. Shooters may enter for price of targets only. Should there be time, a miss-and out, straightaway, 20yds. rise, $1, and 10 targets, expert rules, entrance $1, will be shot. Take electric cars to Hanover Park.

Under date of Aug. 29, Mr. Samuel Bowker writes us as follows: "In regard to the amateur shoot at Natick, Mass., scheduled to take place on Sept. 3 (5th if stormy), we are pleased to state that from indications so far presented there will be from thirty to fifty shooters in attendance. Merchandise values will reach about $150, and there will be in all about $75 in added money to the sweepstake events. Shooters will be protected by awnings over the shooting stand, and stands for spectators have also been erected. Experts and professionals are barred from entry except for birds only."

The programme of the fifth monthly shoot of the Greenfield Gun Club, Pittsburg, Pa., Sept. 5, contains twelve events, of which six are at 10 targets, 50 cents entrance; four at 15 targets, 75 cents, and two at 20, $1 entrance. Targets 1½ cents, included in entrance. Shooting commences at 1 o'clock. Moneys divided according to the Rose system. Magautrap will be used in all events. Dates for private shooting matches can be arranged for on application to the secretary, John C. Knode, Greenfield avenue, Pittsburg.

The match for the cast iron badge at Eau Claire, a full account of which, written by Mr. Hough, is published in this department, was of an exceptionally high order. Heikes won by a score of 99 out of 100, the lost bird dying out of bounds, while Gilbert made the excellent score of 94, with two dead out of bounds. Heikes used his Winchester, with 45grs. of Schultze in a Leader shell, while Gilbert, we presume, used his Smith gun and favorite load of 3½drs. of Du Pont powder in a Leader shell.

Mr. Arthur A. Fink, of Reading, Pa., well known for his enthusiasm in matters pertaining to trap-shooting, made a brief call in FOREST AND STREAM office on Monday of last week. He returned on that day to his home. He reported that trap matters are active in and about Reading, and that the Mount Penn Gun Club's forthcoming tournament, Sept. 5 and 6, of which he is manager, was most gratifyingly promising.

The Interstate tournament at Haverhill, Mass., Sept. 7 and 8, closes the events of the Interstate Association for the year. The season as a whole has been notably successful, although the war interfered with a part of the Interstate programme—the shoots at Wilmington, Del., and Portsmouth, Va. No small measure of the success was due to the Interstate's skillful manager, Mr. Elmer E. Shaner.

In the watch charm handicap of the Brockton Gun Club, Aug. 20, Leonard, Barrett and Allen tied, which tie will be shot off on Labor Day. In the 25-target event Grant, Stanley, Barrett, Leonard, Donoghue and Allen scored 25 each, Allen making a clean score apart from his handicap allowance. The club expects to hold an invitation shoot on Labor Day.

On Saturday of this week at Elkwood Park the Country Club cup will be shot for. The conditions are 20 live birds, $20 entrance, 25 to 30yds. handicap, cup and 40 per cent. to winner; 11:30 A. M. On Sept. 7 there will be all-day sweepstake shooting. On Sept. 10 Mumm prize, 30yds., 5 birds, entrance free; ties miss-and-out.

In the live-bird contest at Morfey's grounds, Lyndhurst, N. J., Aug. 23, $16.25 entrance, birds included, four moneys, Doty killed straight and took first money, $56; Brewer was second with 24, which won $42; Money and Morfey killed 23, dividing $28, while Bunk, Timmons and Daly divided $14 on a score of 22 each.

The shoot of the Hudson River Trap-Shooters' League, fixed for Aug. 24, at Warwick, N. Y., was called off in consequence of the non-attendance of the outside members. The Warwick shooters were keenly disappointed at the outcome. A club shoot was held instead.

The Baltimore Shooting Association, Baltimore, Md., has set Oct. 18 to 21 inclusive, on which to hold its fourth annual fall tournament. Two days at targets; two at live birds. Geo. S. Harrison, 120 E. Baltimore street, secretary.

In the 50-target event at the Hingham Gun Club's shoot on Aug. 20, the scores were as follows: Henderson 45, Allison 39, Howe 35 plus 2—37, Maynard 20, Higgins 25 plus 10—35, Keene 27, Tinkham 41, Howard 24, Cook 28. The last four were visitors.

In the contest for the Chicago challenge trophy, Aug. 26, Mr. Thos. P. Hicks, the holder of the trophy, defeated V. L. Cunnyngham by a score of 23 to 21. Dr. S. Shaw challenged the winner forthwith after the contest.

The Bloomfield Gun Club, Bloomfield, Ind., will hold a target tournament on Sept. 28 and 29. This club is a member of the Indiana Trap-Shooters' League.

In the contest for the Troisdorf cup at the Brooklyn Gun Club's shoot last Saturday Dr. Smith was the winner after shooting off four ties with Mr. Skidmore.

By referring to our trap fixtures, readers will note that Labor Day (Sept. 5) affords ample opportunities for shooters to test their skill.

The next shoot of the Central New Jersey League will take place at New Brunswick, N. J., Sept. 17.

The regular monthly shoot of the Boiling Springs Gun Club takes place on Saturday of this week.

BERNARD WATERS.

Connecticut State League.

BRISTOL, Conn., Aug. 25.—Inclosed find scores of the fourth tournament of the Connecticut State League, held on the grounds of the Bristol Gun Club, Monday, and a right royal time they had at the tables. Shooters were present from New Haven, Hartford, Guilford, Thomaston, Windsor Locks and other places. The teams were captained by Savage, of New Haven, and Mills, of the Bristol Gun Club; eighteen men on a side, 20 birds per man, known angles:

Savage's team—Savage 18, Longdon 18, Manross 16, W. F. Parker 18, Bates 18, U. M. C. 15, Clark 13, French 17, Robertson 17, Meachem 14, Thorpe 13, Gaines 12, Hart 10, J. M. Taylor 17, Porter 11, Bassett 14, Penn 9, Hooker 7—257.

Mills' team—Mills 18, Stevens 20, Neale 17, Hull 18, Post 12, Avery 18, Cutler 18, Treat 16, Fruit 13, Bristol 18, Judd 10, Hazel 6, Horton 18, Birdsey 13, Burwell 11, Roberts 18, Bailey 16, Taylor 14—272.

H. J. MILLS.

Lake City Gun Club.

WARSAW, Ind., Aug. 25.—Our tournament, Aug. 17 and 18, was well attended, and was successful.

In almost every issue of sporting papers we see something about barring the manufacturers' agents and experts. As for my part, I cannot see that it makes much difference, as some of the amateurs shoot fully as well as the experts, as will be seen by reference to the scores of our tournament.

The highest average for first day was won by Partington, Dr. A. F. Britton, of Indianapolis. His score was 115 broken out of 120 shot at. The highest average for the second day was won by Vail, R. Valentine, of Monroeville, O., score 111 out of 125:

J. S. CAMPFIELD.

Audubon Gun Club.

BUFFALO, N. Y., Aug. 27.—To-day was an ideal day for shooting, and consequently the attendance at the weekly shoot of the Buffalo Audubon Club showed a marked increase. The feature of the shoot was the eighth of the series of monthly cup shoots. This was event No. 4. It resulted in a tie between Chas. S. Burkhardt and Geo. Zoeller, which will be shot off next Saturday. No. 3 was the badge shoot; in Class A B. Talsma and Chas. S. Burkhardt tied, Talsma winning the shoot-off. Dr. Carroll won Class B, and Dr. Sauer Class C:

BUFFALO AUDUBON GUN CLUB.

Florists Gun Club.

PHILADELPHIA, Aug. 23.—The main event of the Florists Gun Club's monthly shoot was the president's medal contest. The shooter making the greatest improvement over his previous record took the medal for the month and received 6 points, the next five making similar improvement receiving 5, 4, 3, 2 and 1 points respectively. There was a strong wind; weather warm, and shooting hard. Smith broke 95 out of 100 for the day.

Team match, 15 known targets, four men: Burton 13, Anderson 12, C. D. Ball 12, G. O. Bell 11; total 49. Smith 14, Park 12, Harris 10, Jones 9; total 45.

Team match, five men, 25 targets, known angles: Burton (captain) 21, Anderson 21, C. D. Ball 17, G. Bell 17, L. Ball 8; total 84. Smith (captain) 25, Park 21, Harris 16, Jones 15, Wescott 16; total 93.

President's medal, 50 targets:

	Unknown.	Known.	Total.	Points.
Harris	19	17	36	..
Wescott	9	11	20	6
Jones	13	19	32	2

McKaraher	19	21	40	..

WESTERN TRAPS.

WINNEBAGO GUN CLUB.

Winnebago Gun Club, of the good shooting town of Oshkosh, Wis., made a very nice success of their tournament last week, beginning Aug. 20. Among others from abroad were Fish, Scammon, Churchill, Moon and Smith, of Eau Claire; Graves, of Loyal; Marsh, of Spokeville; Farber and Meunier, of Milwaukee. The second day showed a gain in attendance, and the affair is reported as pleasant, with honors well distributed, the Eau Claire and Milwaukee men having a shade the best in the totals.

COMING.

Monroe Gun Club, of Monroe, Mich., will hold a tournament, targets and live birds, Sept. 7-8, Jack Parker manager, which of course augurs well for a good shoot.

Aledo Gun Club, of Aledo, Ill., will hold its annual shoot Sept. 7-8-9, with seven target numbers and three live-bird events daily, and $50 average money to three high guns at close of shoot. J. F. Henderson, Sec'y.

Mr. W. D. Townsend, of Omaha, Neb., tells me that the fourth annual shoot of the Du Pont Gun Club, of that city, will be a good affair and worth keeping in mind for Sept. 21-22-23. There will be $500 added money. In all likelihood the "equitable system" will be shot, or at least plans are now making to change the programmes to that effect, it being thought better to use that system than the old one of class shooting.

E. Hough.

1200 Boyce Building, Chicago, Ill.

CHICAGO CHALLENGE TROPHY.

The contest for the Chicago challenge trophy between Thos. P. Hicks, holder, and V. L. Cunnyngham took place on Friday afternoon, Aug. 26, at 2:40 P. M., at Watson's Park, Burnside Crossing, Ill. The attendance was comparatively small, though considerable interest was shown by those present. The sky was overcast, and a mild wind blew from the left quarter. The birds were fairly good for summer birds. Among those trapped were some hot ones.

The handicap was T. P. Hicks, 25 birds, 30yds. rise, and V. L. Cunnyngham, 25 birds, 29yds. rise, still he shot at 30yds. from choice. Mr. Hicks shot a 10-gauge Wesley Richards, with 4¼drs. Du Pont powder, Smokeless shell, 1¼oz. No. 7, while V. L. Cunnyngham shot a 12-gauge Wesley Richards gun, with 3¾drs. Schultze powder, Smokeless shells, 1¼oz. No. 7.

Both gentlemen shot in good form, and many good kills were made by each.

The rules provide that a majority of the trustees shall be necessary to establish a handicap, giving birds and yards as they may deem proper to put all contestants on an equal footing. In this instance, one of the trustees being the holder of the trophy, took no part in the handicap arrangement; another of the trustees being out of the city for several weeks, and only returned the morning of the day of the contest, hence the handicap seems to have been made by one trustee only, which is not in accordance with the rules. Still apprised of these existing conditions, Mr. Cunnyngham shot without a protest.

It is expressed by several eligibles that a meeting should be called to elect trustees to replace those having personal interest in the trophy.

Following are detailed scores of the event, which was refereed by John Watson.

Trap score type—Copyright, 1898, by Forest and Stream Publishing Co.

	5	4	1	2	4	4	3	4	3	2	2	1	4	2	3	5	2	4	5	5	2	3	5	5	4

Immediately after the contest Dr. Sirembo Shaw challenged Mr. Hicks under the rules, and he is the only one known to seek contest for the trophy at this time.

EUREKA GUN CLUB.

The Eureka Gun Club held its regular weekly target contest on the club grounds, corner Seventy-ninth and Vincennes avenue, Saturday afternoon, Aug. 27. There was a large attendance. Among others were the wives of several members, who spent some time in practice at the traps. There was a soft sunlight, accompanied with a fresh quartering wind, which made the shooting somewhat difficult.

The trophy event, at 25 targets, was as follows:

Class A: J. S. Houston 18, F. P. Stannard 21, E. M. Steck 13, W. D. Stannard 21, A. W. Adams 18, A. C. Paterson 20, R. B. Miller 15, W. E. Phillips 17, W. R. Morgan 21.

Class B: Darlington 11, H. F. Carson 23, H. B. Morgan 14, H. Vetter 21, C. W. Carson 21, V. L. Cunnyngham 20, O. V. Buck 18, R. B. Carson 14, S. Matthews 14, Doc Morton 17.

Class C: Nita 18, Mrs. H. F. Carson 6, Boroff 22.

The Classes A and B medal ties were not shot off. Class C was won by A. C. Borroff.

GARFIELD GUN CLUB.

The Garfield Gun Club's weekly was held on Aug. 27. The attendance was fair. The wind blew from the left quarter. The targets thrown were somewhat erratic in their flight.

Following are scores in the trophy event of 25 birds, known traps, unknown angles:

Class A was won by R. Kuss on a straight score. Class B was won by Samuel Young in the shoot-off, and Class C was won by De Maris:

Workman 21, Nusley 18, Pollard 20, Meek 21, Neal 14, Kuss 25, Shaw 20, De Maris 19, Richards 22, Smedes 22, Young 22, Palmer 9, Hellman 15, Comelson 12, Hicks 23, Eaton 14, Kelly 20.

Shoot-off for B medal: Young 14, Smedes 11.

A. C. Paterson.

Heikes—Gilbert for the Cast Iron Badge.

Eau Claire, Wis., Aug. 27.—If there should be heard issuing from the vicinity of Dayton, O., a low, deep, sizzling sound, the hearer need not be alarmed, for it will only be caused by Rolla Heikes frying eggs on the cast iron badge at his own fireside. Appearances would indicate that Mr. Heikes intends to stay in the cook stove business. Neither Charlie Budd, nor Charlie Grimm, nor Fred Gilbert, each of whom is something of a shooter, has been able to carry off the lid of Rolla's stove, and it looks as though Rolla was intending to claim the title of Daddy of Them All not only in the target, but also the live-bird world.

Heretofore the score of 93 live birds in a race was the highest the Daddy of Them All had made. To-day he let out a few notches, and calmly as though in peaceful slumber killed 99 birds scored dead, and the other dead just over the line. It was no particular use to try to beat him to-day, neither Fred Gilbert nor any other shooter had any business trying. Fred congratulated Pop, as he calls Rolla, and said that he himself was hardly in the race. Yet Fred's score of 94 was a good one, and one which not many men have any license to beat. It may be seen therefore that the entertainment to-day was of high class, and that such races do not often come out of the box. Both men received the applause they both deserved.

GOOD WEATHER.

The day was perfect for shooting, bright, cool and bracing, with a fresh wind, just the weather to make the birds lively. The birds themselves were very good, a strong and bright lot. Out of 200 there were seven that dwelt at the traps after the pull, but only three needed flagging, and the stop was usually but for an instant, as the bird ran a few feet before taking wing. The peculiarity of these pleasant Eau Claire grounds is that they lie in a sheltered valley and are surrounded by a high board fence. It may be this peculiarity of location which caused the great percentage of birds which started high, of which towerers were numerous. Sometimes a bird might be marked an incomer or a driver, when the type would hardly indicate the character of the flight, which would be as high in the air as it was far from the trap. The wind was fresh enough, but blew toward the score in the direction of a left-quartering incomer. It could not be said that the shooting was so easy, for, though it might have been harder, had the wind blown from the score, the flights will be seen to be very mixed.

The active and enterprising men of the Eau Claire Gun Club had everything well arranged, as usual, and a good crowd of spectators was on hand, including many shooters from outside points. I should think there were 275 to 300 persons in the grand stand. Mr. and Mrs. L. M. Harrison, of Minneapolis; Judge Moer, of Duluth; U. M. C. Hallowell and others came over from Minneapolis this morning; Ed Bingham came up from Chicago. Enough shooters were on hand to get up some nice sweeps before and after the match. The trapping was prompt, and the handling of the birds good. Mr. E. M. Fish served acceptably as referee, though there was not much need for anything in the race besides Rolla Heikes and his pump gun, which combination held the center of the stage for most of the time.

HOW IT RAN.

Mr. Heikes won the toss and went to the score first, stopping a good incomer. Gilbert killed on outgoer to the right in slap-bang style. Gilbert had rather the favorite's end of it, for he has been shooting live birds with such uniform success that he was thought invincible. Yesterday on these grounds he killed 30 straight in practice, and Heikes but 26.

Both men shot along at a slashing gait. Heikes was the first to lose, his 11th bird, a fast white outgoer to the left, not being caught with the second, though the first cut it to pieces, so that it fell dead just over the fence. For the next 30 birds Fred pounded along without a miss, Rolla hanging at his heels. Fred ran 41 straight, and Rolla kept along straight also, so that though Fred was one bird ahead at the first turn, at the 50 hole the men were tied and the interest was high, for both seemed in championship form. Some exception might have been found when Gilbert made a sloppy first on his 21st bird, and only saved himself with his second, repeating this on his 23d. His 33d also was a long second, and his 37th, a fine stop at 45yds. His 42d was lost an incomer that was able to reach the roof of the shed. Again Fred made a lucky slobber with the second on his 44th, not hit full. His 50th was only stopped by a good second. His 51st was flagged. His 55th was killed by a slow, but careful, second. His 56th was not hit at all by the first, and his 58th needed the fast second that it got. His 66th was a far kill on a driver. His 68th was not much injured. My this time, since Heikes was still looking like a graven image and shooting like a fiend, still straight, the odds were very much against Gilbert. All his hope fled when on his 71st bird he missed with his first and flinched off with his second. Something a bit like loss of heart was suggested when on his very next bird he repeated this identically, not touching the bird at all! His 77th bird seemed easy, but was not hit with right or left. His 96th was a long second barrel kill. Much applause greeted both men at the brilliant kills that constantly came out.

After missing his 11th bird Heikes settled down and ran the remaining 89 straight. His 13th brought applause. His 26th was a wonder, a screaming, fast, slate-colored, small bird, which was fast as one ever sees on any pigeon park. The second cut it down close to the wire amid shouts of applause. His 28th showed a sloppy first barrel, but his second saved it. His 33d was a long second. His 34th was released before the call pull and he did not accept it, but might have well done so, for the alternate bird proved a screecher and was killed far to left, near the wire. His 36th showed a good second, and so did his 38th. His 41st was the third of these very hot left-quarterers he had caught close together. It was astonishingly swift, but the first cut it up so badly that the second stopped it. Again his 42d was a stem-winder, and his killing it at 50yds. brought the now excited crowd to its feet. His 45th was a hard one, well timed, and his 59th got a quick and deadly first, or it must have been lost. His 64th was not hit with the first, but the second killed it stone dead at 50yds. His 78th was high and fast; his 83d was a great kill in the deep field. His 86th was another of the red-hot left-quarterers, of which he had had and killed more than his share. It had great vitality. The second barrel knocked it down, but it rose and wabbled on, falling against the wire boundary, where the dog caught it. All retrieving was done by dogs, and well done. His 99th bird was killed with a long, deliberate second, which again earned him a hearty "hand" from the crowd. His last bird was cut down sharply, and so he ended a phenomenal race. The scores were duplicates of the Elliott-Budd race here, when Elliott killed 99. Heikes really killed his 100 birds, one dead out. Gilbert had two dead out. The latter was not in his average form, it seemed, and felt badly at making so "poor a score." There is no occasion in the world for Fred to feel badly over a score of 94, on good birds on a good day. There are a few of us who would like to be able to get that many right along, and the man who can do so can break the gang in a few years. Heikes was not in condition to-day to be beaten by anybody, and that is the reason he won. It will be long before his score is duplicated under any such conditions, and it certainly is the only demonstration needed (after his recent defeat of Gilbert for the E. C. cup) of the possibilities of the pump gun in the hands of a man in a trance. The result of to-day's race was a surprise in one way, for no one could have looked for such high scores. Between the two men there was not much choice before the race. Rolla Heikes has now come about as near gathering in all the hardware as any of the experts who have contested for the main trophies now before the public, and seems to have laid a large sinewy grasp upon the E. C. cup and the cast iron badge, and to have taken a great notion to make trouble for the boys either at targets or live birds. This is why you may perhaps hear the low, sizzling noise from the vicinity of Dayton, O. Following are the scores:

E. Hough.

1200 Boyce Building, Chicago, Ill.

Trap Around Reading.

Reading, Pa., Aug. 20.—A meeting of the committee in charge of the coming merchandise shooting tournament, to be held Sept. 5-6, at Reading, under the auspices of the Mount Penn Gun Club, was held this morning, with a full attendance of all the committee. The chairman, Mr. Yeager, reported as having thus far secured 125 fine merchandise prizes from the citizens of Reading, and 75 prizes from firms and friends out of town. The chairman also reported having secured the services of Arthur A. Fink as manager, who, with the assistance of the whole committee, will try and leave nothing undone, and will say that the coming tournament will eclipse any tournament ever given in this vicinity. The entries for the intercounty team shoot for the Mount Penn trophy, valued at $150, are coming in fast, and the secretary thus far has received communications from different clubs to the number of seventeen that they will enter one or two teams in this shoot. The merchandise prizes are useful articles, and there are also money prizes in gold. The shoot will be held on the Mount Penn Gun Club's fine shooting grounds, situated on Mount Penn.

To reach the grounds take a Mineral Spring car, getting off at the Gravity Road Station, and there change to the cars for the ride over the mountain. The fine scenery that greets the eye on the way up is a treat that is never forgotten. The scenery from the tower, a point 1,700ft. above sea level, is often called by travelers the Switzerland of America. The car makes a short wait here, when the ride down the other side of the mountain is begun by gravitation. The shooting grounds are situated right along the road, and the shooters stops at station Shooting Flat.

The programme contains events at 10, 15, 20 and 25 targets each day at a reasonable entrance fee. The intercounty shoot for teams of five men each promises to make things interesting. The club and manager extend a hearty invitation to all shooters to attend and any information wanted will be given by addressing the manager, Arthur A. Fink, 426 Franklin street, Reading, Pa. Dinner can be had on the grounds.

The South End Gun Club held a practice shoot to-day on their grounds, some fine scores being made. The two teams that are to represent this club at the Mount Penn's intertrophy shoot were out in full. The scores follow:

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6

Pottstown, Pa., Aug. 20.—The third and final match between the Shuler and the Phoenix gun clubs took place here to-day on the grounds of the Shuler Club, resulting in a victory for Shuler, 214—191, and also victor of the series, winning the three straight. Benner and Smith made the best scores for Shuler, while Harris did the best work for Phoenixville. Interesting sweeps followed the team shoot. The scores follow:

First event, team shoot, 25 targets per man, teams of twelve men each:

Shuler Gun Club—Benner 22, Sheeler 16, Miller 15, Capt. Wickersham 20, Saylor 18, Davis 15, Grubb 18, Wein 19, Slonaker 16, Smith 21, De Witt 15, Shaner 19—214.

Phoenix Gun Club—Capt. Johnson 19, Harris 21, J. Buckwalter 13, Trumbauer 19, Pierce 15, Dotterer 14, Erb 15, Hodge 16, Dunlap 16, H. Buckwalter 20, Daucy 11, Pennypacker 12—191.

Reading, Pa., Aug. 27.—The South End Gun Club will hold a shoot on Labor Day, Sept. 5, when the three medals will be put up for competition in classes A, B and C. A large number of shooters have signified their intentions to be present, and good scores can be looked for. Also at this shoot the second team to represent the club in the intercounty trophy shoot, Sept. 5-6, will be decided upon.

Pottstown, Pa., Aug. 27.—Sportsmen from Berks, Chester, Lehigh, and Montgomery counties took part in a target tournament held here to-day on the Shuler Shooting Club's grounds. The principal event was a 25-target match for an L. C. Smith hammerless gun. Each shooter had the privilege of entering as many times as he wished. Mr. N. W. Benner, of Boyertown, won the gun with 24 out of 25.

Pottstown, Pa., Aug. 24.—Members of the Shuler Club held a practice target match here this afternoon in preparation for their final match at Phoenixville to-morrow with the West Chester Gun Club.

Phoenixville, Pa., Aug. 25.—The greatest shooting event ever held here came off on the grounds of the Phoenix Gun Club, of this place, to-day. Three gun clubs—Shuler, of Pottstown; West Chester and Phoenix, of this place—participated, and fully 500 people were present to witness the sport, which lasted from 10 A. M. to 6 P. M. Matches were shot between the Shuler Shooting Club, of Pottstown, and West Chester Gun Club, of West Chester, and also between Phoenix Gun Club and West Chester. In the first event Shuler won by the score of 228—214. This match was the final match of a series of three, in which each club won one match.

The second event of the day was the first of a series of three matches for the championship of Chester county between Phoenix and West Chester gun clubs. Phoenix won to-day's match by the score of 216 to 207.

Following these events, the programme consisted of fourteen sweepstake events, which were well filled, especially one event—10 targets, 50 cents entrance—which had thirty-nine entries. The Phoenix Gun Club will enter two teams of five men in the intercounty trophy shoot at Reading, Sept. 5-6, also the Shuler two teams, and West Chester probably one. The second of the series of Phoenix vs. West Chester will be shot at West Chester on Sept. 3.

Duster.

Pills and Shaner vs. King and Bessemer.

Pittsburg, Pa., Aug. 24.—Pills and Shaner won. Defeated King and Bessemer in the big shoot at bluerocks. Fine shooting. The long looked for and much talked over team contest between Pills and Shaner, of the Greenfield Gun Club, and King and Bessemer, of the Herron Hill Gun Club, was shot off yesterday on the Greenfield avenue grounds, and was won by Pills and Shaner by a score of 453 against 438. There was five minutes' rest between each round of 25 to allow the guns to cool, so that the actual shooting time was seventy-one minutes.

This match has been on the tapis for some time, and has recently been about the most talked of thing in shooting circles for the past month, and there were a few bets laid on the result. The conditions of the match were that each man was to shoot at 250 bluerocks, and the stake was $25 and expenses per man. The officials of the shoot were: Referee, Louis Lautenslager; judge for Pills and Shaner, George Cochran; for King and Bessemer, John Gelm. S. T. McClarren and J. J. McNeil were the official scorers, while Bill McCrickert looked after Shaner's interests, and Tom Evans took care of Pills. The contest was witnessed by a large crowd of spectators, and there was considerable enthusiasm. The shoot lasted one hour and fifty-six minutes, and the scores made follow.

Bessemer shot a Remington gun, Du Pont powder and Smokeless shells. King shot a Scott gun, Du Pont powder and Smokeless shells. Pills shot a Smith gun, Gold Dust powder in High Base shell, and Shaner shot a Parker gun, E. C. powder and Trap shells.

Confabulations of the Cadi.—II.

The Cadi Discourseth on Professionals and Amateurs.

THE Cadi, being a man of good sporting blood, was the president and moving spirit in the local gun club, most of whose members lived in the country town about three miles from the Cadi's home. He, though all but an invalid, as will shortly be more fully explained, was far away the best shot in the club, and therefore gradually became unpopular, in so far as much adverse talk behind his back was concerned. There was much private denunciation of his greed, and brave propositions as to whether it were best to bar him entirely or impose a handicap on him.

It was known that the Cadi had accepted some free ammunition, and had been the recipient of a gun as a gift, and it was generally believed that he was receiving also a small salary for shooting the same gun, all of which was very irritating to those who shot and paid for their own guns and ammunition, though several of them had made an attempt to secure such goods free, but had failed, which made them still more hostile to the good Cadi.

The poverty of the latter seemed to render any action unnecessary either as to a bar or a handicap, for each shoot seemed to be the Cadi's last, owing to his financial embarrassments, or state of being always "dead broke." However, the Cadi's wife always managed to scrape eggs enough at the last moment to defray his entrance in the first sweep, and once so fixed he was fully equipped for the day, and certain to return home with money enough to buy tobacco, snuff and flour to last a month; at all events the tobacco and snuff were a certainty to himself and wife, while the members who were less expert perchance were forced to obtain tobacco and snuff on credit for the same length of time.

For these and others reasons there were many private consultations of the club members, all of whom assented to the crying need of barring the offender. The whole matter, however, was balked for many weeks by the reluctance of each one to take the initiative in bringing it to a climax. One after another was elected to the office of club delegate to notify the Cadi personally that he was persona non grata, but each in turn gave most excellent reasons why some one else could do the matter with more grace and precision, and retired in favor of said some one else. Thus, while they were all agreed, each one wanted the other fellow to do the unpleasant task.

The Cadi's two companions also were fellow club members. Upon them he could rely every day in the week for companionship in general, and to a certainty while his cider barrels were not empty. One of the two was Si Simpkins, commonly called Moke; the other was Ephraim Strange, two entirely opposite characters. Moke was on the negative side of every proposition, and would not be convinced on any point, however simple, while Ephraim, who strove to be popular, would assent to any absurdity. Moke at length was secured to convey to the Cadi the state of the club's sentiments, by the device of declaring that it was something which he dare not do, while Ephraim, by a few of Si's blandishments, was easily cajoled into jointly assuming the unpleasant office. Thus they became a committee with full powers to act as they deemed best—and as they felt as the other club members did, namely, that the Cadi could shoot too well to please them, no further instructions were deemed necessary in the way of answers to the Cadi's arguments, nor was it even considered that he had any to make, or that there were any.

As hinted at hereinbefore, the Cadi was not a well man. It was indeed a lucky circumstance that he had such natural legal abilities, and was so much sought to settle the differences between neighbors, otherwise a cold, unfeeling public would have branded him surely but unjustly as a loafer, instead of esteeming him for his useful genius.

Loafer he was not, in spite of the fact that he placed his chair on the west side of the house in the morning soon after he had eaten his breakfast, following the shade around as the sun came upon him till the evening hours brought night and comfort. He was not a well man, he assured his friends. There was some occult disease slowly but surely sapping his vitals, which was seriously aggravated by any attempt at manual labor; consequently he always sat or moved about with an air of great langour, the air of a martyr, who wears a placid exterior to conceal interior suffering. Even when, gun in hand, he set forth in quest of squirrels, rabbits or possum, he walked with the dignity of a Cadi and the lassitude of an invalid, till he was well out of sight of home and neighbors. Then, with a free field and the spirit of the hunt upon him, he was as vivacious and as enduring as an athlete, with the difference, however, that on the nights of such days he always suffered great agonies and exhaustion, which he, with much parade, endeavored to conceal from his wife, but which she, good woman, always detected and provided for beforehand. From long experience Hopie Jane had learned that nothing in the whole pharmacopœia allayed his agony so quickly and soothed him so nicely as hot cider well peppered, administered in generous quantities till the crisis was past and her liege out of danger. About two quarts was the standard dose to secure the most beneficent effects.

If thus he was blessed in having the just esteem and confidence of his neighbors, he was a thousand times more so in having so good a wife. She was indeed a helpmate to him, in spite of not being enthrallingly sweet to gaze upon, being flat-chested, round-shouldered, lanky, with no curves in her figure save that of a fiercely hooked nose. She was the mother of eleven children, all of whom had lovely white hair, embellished with a few tan streaks at their crowns; and a year or less marked the difference of time between their ages.

The good mother toiled and moiled from morn till late at night, cooking, washing, gardening, houseworking, hog feeding, poultry raising, dragging dead timber from the woods for fuel, chopping wood, and caring for the Cadi and his children. He was 6ft. high, weighed 208lbs., was the picture of good health, and yet it was dangerous for him to work. To his drudging wife the Cadi appeared to be better and wiser than all other men, and if he were lost to her she would be inconsolable forever. Morning after morning for years the Cadi had threatened to go to work the next morning in spite of his infirmities, and she was in fear every morning that he would do so, and that the earthly career of the man she adored would soon end, and the light of her life would go out with him. It may be said as a tribute to her devotion that when at last the Cadi did pass away at a ripe old age, his memory was hallowed by her during three months, at the end of which time she married Si Simpkins; but finding widow's weeds very becoming to her and also withstanding wear admirably she wore them a year longer.

The committee, after many postponements on one pretext and another, at length appeared one morning with a firm resolution to have it out on the club matter. They immediately sought for the Cadi on the shady side of the house, where they found him comfortably seated in a home-made arm chair, his feet resting gracefully on the back of another.

"Hello," said the Cadi, "where've you fellers been for a long time back?"

"Oh, just knockin' aroun'," said Ephraim.

The Cadi yawned, stretched himself, went to the well and slowly turned the windlass till the bucket was within reach, from which he took a pitcher of hard cider, which he kept always cooling on hot days. He took a good long pull himself, then passed it to Moke, who duly honored it, then passed it to Ephraim, whose mouth had been watering meanwhile.

Then the committee looked at each other, and made secret signs each to the other to begin. At last Moke said, with something of a quaver in his voice: "Have you heard what the fellers have been saying about you in the club?"

"No; what have they been saying?" queried the Cadi.

"They all say that they don't want you to shoot in the sweeps any more. You can stay in the club of course and shoot for targets, and spend your money, and have all the other club privileges which will help the club out, but they don't want you to shoot in no more sweeps, because you are an expert and a manufacturer's agent."

"Does this mean that you too think so?" queried the Cadi.

"Yes, it does," replied Moke, who, now that the ice was fairly broken, was ready to take the plunge.

"Why do you think so?" continued the Cadi.

"Because," replied Moke, "it is my interest to think so. You win all my money at every shoot when there is anything worth winning, and I want you barred from the sweeps. I only shoot for fun, being an amateur, with the other fellows, but there's a heap more fun when I put up my money against some other fellow than you. I don't care for the money anyhow; it's the sport I'm after. I shoot only once or twice a year, and things should be so arranged that we amateurs who only shoot now and then can have a chance."

"Moke," said the Cadi gravely, "do you throw any money in the river when you go a-fishing? No; and you enjoy it just the same? That is sport. When you shoot, that is sport too. When you put your money up in a sweepstake, you add a new factor to the sport. You assure me that you do not care for the money, yet you wish to bar me for the reason that I win your money; and you talk much of sport as if it was an attribute of men who shot poorly, and that men who shoot well do not possess the quality of sport. You admit that I shoot well, but you seem to assume that I have no liking for sport because I can shoot well. You seem to think that because you shoot only once or twice a year you are deserving of some special and generous consideration. On the contrary, men who shoot only once or twice a year deserve no consideration at all. If no one shot but men of your class—that is, men who shoot once or twice a year—there would be no clubs and no tournaments. If you are the great and only class, why do you not get up tournaments of your own? What did you ever do for sport in general? Shot once or twice a year. Very good. Now concerning my being a manufacturer's agent—what about it?"

"Well, you get your ammunition free, and that isn't fair to us," replied Moke.

"Do you pay for your ammunition?" queried the Cadi.

Moke remembered his unpaid accounts at the store, and pertly replied: "That's my business."

"I should better have asked if you promised to pay for it," said the Cadi kindly. Continuing, he added, "I might say that whether or not I pay for my ammunition is my business. The fact that I shoot my ammunition free of cost does not necessarily make me a manufacturer's agent. To be an agent I must represent the company in some way. Would you take your ammunition for nothing if you could get it so, Si?"

"I tried to a few times, but I couldn't make it go," said Moke frankly.

"I shoot better than you do," resumed the Cadi, "because I shoot oftener, and I take an interest in shooting well. I experimented with loads till I found one that would suit my gun and suit me. Did you ever do so? No. I had the stock of my gun changed several times, so that it would fit me to a nicety. I tried other guns to determine the proper length and drop of stock. I practiced with one eye open and two eyes open. I experimented with my hand, extended to different places on the barrel, till I found where I could best hold so as to have free movement in swinging to right or left, and I studied velocities, the different speeds and flights of targets, the differences of holding on a calm or windy day, and a thousand other little things which help to make success. Do you do these things, Si?"

"Never thought of them," Si replied.

"I have put up my money week after week, and month after month, and year after year, when I did not shoot much better than you do, if any, and when my lovely and bright children were without shoes, and my wife without snuff, and it's pretty bad times for me then; but I never uttered a complaint. Do you do so?" said the Cadi.

"No, I don't," said Moke.

"Nor I neither," said Ephraim.

"I recognize the difficulties with which at the present day the novice is confronted in his endeavors to acquire a reasonable proficiency in skill or to become an expert; difficulties which multiply with each passing year, owing to the greater number of experts or semi-experts who are graduated, and with whom to a certain extent he comes in competition. Each year the general standard of skill necessary to even partial success becomes higher. Now all of us, from the experts down to the common shots, could shoot together harmoniously and advantageously if we would adopt a system of handicapping. As for the novice, I do not consider him; for trap-shooting at tournaments is not a primary school for the education of beginners. All sports involving competition presuppose a reasonable degree of training in the contestants. They do not offer premiums on incompetency, but, on the contrary, are devised to perfect to the highest degree the abilities of their devotees. The expert and semi-expert do not much favor a handicap, since their trips to the cashier's office are fewer and less interesting. There are some amateurs who, though shooting badly, think it 'plucky' or 'game' to enter every sweep against all experts who may be against them; but the best gameness is that which is reasonably tempered with good sense. In the end the handicap system must be adopted, but it is too broad a subject, however, to take up to-day. What do you think of a handicap, Moke?"

"First-rate thing, when the men who can beat me are handicapped," replied Moke.

"Before shooting in a tournament, I have practiced with dumb bells every morning for weeks," said the Cadi, "so that I would have the strength and address of arm and body to shoot through the day without fatigue. I have taken my gun in hand and aimed it at different objects, twenty minutes at a time, in my room in the morning, day after day for weeks, and yet you, who never have taken the pains to perfect yourself as a good shot, instead of striving to equal me or excel me, are devising ways to drag me down to your level. You seem to think that I am the source of your troubles. Did it ever occur to you that there was more professionalism in our club than there is in me? You don't know. Well, there is. You see me and some others go to the cashier's window and pull out some money, and you jump to the conclusion that we have taken your money, which you put up for sport, but which, after you have had your sport, you want back again. Now you know that the great bulk of the trap-shooting of America is not done by millionaires. Most of the trap-shooters are office men, or men on salaries, who can afford $3 or $4 a day very comfortably for their sport. Well, our club charges 2 cents for targets. That doesn't seem to be much, but when we throw 5,000 targets in an afternoon, that means that the club has raked off $50 profit on the $100 paid in for targets. You can see that if the boys shoot long enough the club will have all their money. Now, if I was a campaigner, who went week after week from shoot to shoot, I could quite understand your objections, but as I have been one of the hardest workers in the club, I ought to be treated more kindly. What do you think of the matter now, Si?"

"I think that we want you to get out. We know you shoot better than we do, and that's sufficient trouble for us without prying into the innards of things."

"I never expected this from you, Moke. Sharper than two serpents' teeth is base ingratitude," and the Cadi put his head on his arm and wept loudly.

BERNARD WATERS.

Respectfully Submitted to the Cadi.

BUFFALO, N. Y., Aug. 20.—*Editor Forest and Stream:* Having read in your issue of the 13th inst. the Cadi's valued opinion given in the communication headed "It's a Matter of Teeth," I would ask you to submit to that learned gentleman the following:

In recent issues of the sporting papers appears a letter from a Mr. Samuel Bowker, of Natick, Mass., relative to a tournament to be held by the Natick Gun Club, of Natick, Mass., on Saturday, Sept. 3. One of the paragraphs in that letter particularly took my attention. It ran thus:

"It is a well-known fact that the present condition of trap-shooting in the East is due to the manner by which the wolves have infested our locality, just as the pot-hunter has annihilated certain game districts, to the dire regret of every true sportsman."

Then again on top of this letter comes the programme, which contains the following:

"In view of the fact that the attendance of the paid expert and professional shark has completely demoralized trap-shooting in the East, we have the pleasure of announcing an amateur tournament—solely for the amateur—under the principles expounded by Mr. Paul North, of Cleveland tournament fame," etc.

The programme further reads:

"We shall endeavor to cope with Mr. North, and firmly believe that every amateur attending will be pleased with the manner by which we shall preserve his interests. Must we bow to the experts and professionals for the further existence of trap-shooting?"

Now, Mr. Cadi, how about all this? Do you know Mr. Samuel Bowker? I do not, but the programme states that he is "the well-known sportsman, Mr. Samuel Bowker." Of course the fact that the programme says so does not amount to much, for no doubt "the well-known sportsman" himself wrote and drew up the programme, for both letter and programme are exactly on the same lines and both bear unmistakable earmarks of identical authorship.

Of course the professional and paid shark get it in the neck, for that is a popular gag just now. I went to Cleveland, and got it in the neck, as I always do, and as I did again at the New York State shoot at Rochester. I can't shoot well enough to make a straight more than once in a month, so I lose my money, whether the professionals are at a tournament or not. There are just as good amateur shots as there are among the professionals; some of them were at Cleveland, so you can guess where my money went.

My idea is that trap-shooters have about realized that unless they can shoot from 88 to 92 per cent. they are going in for expensive amusement. It took them some time to find this out, but as soon as they did find it out they gave up going to tournaments and took to doing more shooting at home, laying low until their turn came, when they too could break about 90 per cent. and do some skinning on their own account. It is my belief that "the well-known sportsman, Mr. Samuel Bowker," and the man he will "endeavor to cope with," namely, Mr. North, will both find out that the weak amateur shooters will stay away from their tournaments just as soon as they have become educated to the fact that the amateur-expert is just as fatal to their chances as the paid expert, and in some instances does not do the skinning quite as neatly or as pleasantly.

There's one other point, Mr. Cadi, that I would like you to pass upon. Do you not think that the grasping nature of clubs in general has had a good deal to do with this lack of patronage at tournaments, the whole of which has been laid at the wolves' door? Ought a club to try and make money out of the shooters who come to its tournaments?

It is this way: If you charge 3 cents for a target, the rake-off is 30 per cent. of the purse; so you have only to enter events often enough before, unless you are a winner, the club has got all your money. At least, that is the way it looks to me, and I would like to hear from you, Mr. Cadi, as to whether there is anything in what I have suggested.

I might add that the programme for the Natick shoot says nothing about the price of targets; and I notice that very few programmes do say anything about that important feature at the present day. Is there anything in this?

48GRS.

The Wrong Teeth.

NEW YORK, Aug. 17.—*Editor Forest and Stream:* In reading the learned Cadi's ruling in a recent issue of FOREST AND STREAM, I am almost convinced that his knowledge bump is well developed, and at some future sitting or squatting of said Cadi's court I hope he will ponder over some questions that I put to him, and let him hand down a decision from his wood-pile court circuit that will cause wailing and gnashing of the right teeth.

I will confine my questions to target shooting. All of us so-called lambs have no cause to complain when we contest at live-bird shooting, for many of the so-called lambs have chased the young wolf back to the Old Daddy Wolf with an empty stomach.

I for one do not blame the wolf that comes prowling around our fold. He does not come sneaking up quietly, but makes all the noise possible, as he has two missions to fill, namely, one for the Old Daddy Wolf and one for himself.

The Old Daddy Wolf will tell you if you should happen to meet him that the young lambs are not so fat as in early days; that their skins are punctured by worms; the wool gets in the wolf's teeth; or, in other words, there is no business. Shooting is not so popular as in years gone by, and that the people haven't the money. Very truly said, for the expert and amateur cannot both have it in sweepstake shooting.

Now, Mr. Editor, I will, in a trap-shooting sense, kill this fellow that has the teeth stone dead out of bounds. Most any one will admit that you can't teach the teacher, or beat the builder, in any game; therefore handicap the expert so that the amateur will get a chance, and then you will find him up at the traps calling "pull" alongside of the expert. Then, and not till then, will the manufacturer acknowledge that business is improving; and that it seems as if the old days were returning when the manufacturer had no expert out to grab the amateur's money in the way of entrance fees in sweepstake shooting.

I for one have paid dearly for my knowledge bump, and now I hardly can see an expert, but I always uphold and maintain that the teeth are in the wrong mouth of the Cadi's ruling.

DOWN YONDER IN THE CORN FIELD.

The shoot of the Hell Gate Gun Club, at Dexter Park, on Aug. 23, was at 10 birds each. The scores were as follows: L. T. Muench, 28yds., 5; C. Weber, 30yds., 7; H. Bahn, 28yds., 4; J. Himmelsbach, 28yds., 8; J. A. Belden, 28yds., 5; H. Hafften, 28yds., 4; E. Steffens, 28yds., 8; C. Lang, 28yds., 9; F. Trostel, 30yds., 8; E. Dacimck, 30yds., 7; F. Wheeler, 28yds., 3; J. H. Voss, 30yds., 7; W. A. Sands, 28yds., 10; J. Newman, 28yds., 7; C. Wigger, 28yds., 6; H. W. Voss, 28yds., 7; P. Waelfel, 28yds., 10; G. K. Breit, 28yds., 8; L. Stelzle, 28yds., 4; A. Knodel, 28yds., 5; P. Geipel, 28yds., 5; J. Wellbrock, 28yds., 9; J. P. Chambers, 28yds., 3; J. Schlicht, 28yds., 10; C. Schaeffer, 28yds., 3; E. Petersen, 28yds., 8; E. Metz, 28yds., 8; H. W. Richter, 28yds., 8; E. Karl, 28yds., 4.

Minneapolis Gun Club Tournament.

MINNEAPOLIS, Minn., Aug. 26.—It was freely predicted that the tournament of the Minneapolis Gun Club would be a good one, but it is probable that not even its promoters hoped or suspected that it would be the success that it has proved itself. Of all the shoots of the season of 1898, it may perhaps be said that three stand out in special prominence—the Cleveland shoot, the Soo Gun Club shoot and the Minneapolis shoot, just completed. The Cleveland shoot practically "turned down" the paid man, and the Soo shoot also gave him the cold shoulder. The Minneapolis tournament came later in the season than either of the above, at a time when shooting enthusiasm might be thought to be on the wane, and it attempted the plan, of late apparently foredoomed to failure, of shooting the paid man and the unpaid, the expert and the amateur, the wolf and the lamb, upon the same footing and at the same time. The system employed has been in use in the club shoots of the Minneapolis Gun Club for years, and it is not really new to trap-shooters, though I think new in general application in tournament management. It was the so-called "equitable system" (in combination with good added money and with the reputation of doing nothing by halves) which enabled the club to call out one of the greatest shooting crowds of the season.

The principle is something like that of the Rose system, though it does not pay high guns quite so well as the Rose system, but breaks up the money still more, while retaining the idea of paying a shooter for what he does. We may take an example. Suppose we have 100 entries in a 15-target event, entrance $1.50. This makes the purse $150. Take out the targets at 2 cents each, $30, and you have left a net purse of $120. To this may be added any added money offered. We will suppose that three break 15 straight, 45 birds between them. Ten men break 14 birds, or 140 in all. Fifteen men break 13, or 195 birds in all. Ten men break 12 birds, or 120 in all. This completes the places, for the purse is divided on the basis of four moneys. Now add up totals of the birds broken in each class, or 45, 140, 195, 120, and we have a grand total of 500 birds broken. Divide the net purse, $120, by 500, and you have 24, which is to say that each bird broken is worth 24 cents. Therefore the man who breaks 15 gets $3.60, the man who breaks 14 gets $3.36, the man who breaks 13 gets $3.12, and the man who breaks 12 gets $2.88. On this basis, so the president of the club, Mr. S. S. Johnson, informed me he had figured out, in one case where a low shooter would have only taken down the exact sum of 3 cents under the old class shooting system; under the equitable system he took down $1.95, or 45 cents above his entrance money. Naturally he was far more pleased than had he gone up against the stone wall of the older days. It is also a great feature in favor of this system that it prevents all dropping for place, and all pooling and combining.

PROOF OF THE PUDDING.

At most shoots you see a good, stiff accommodation entry for the first two or three events, and then a swift waning, until by the beginning of the second day there are many empty places in the gun racks. Here is what happened at Minneapolis:

In the first event, first day, there were ninety-two entries.

During the first day there were 100 entries in all.

On the first day, out of the total entry seventy-seven men shot on through the entire programme.

On the second day there were sixty-nine men who shot through the entire programme.

During the two days there were 104 different guns at the traps.

There were eighty-five entries on the second day, the fatal second day, when the lamb is usually counting his money to see if he can get home.

Out of the entire aggregation at the score, something over 87 per cent. of the shooters shot through the whole programme. This is absolutely unprecedented in the annals of mixed tournament shooting, where wolves and lambs have met on equal footing.

Out of the 104 shooters present, not one kick, not one objection, not one if, or and, or but, was heard. This also is a revolutionary state of affairs.

The above things being true, the story of the tournament is already told, and it surely is a grand story, better than one could have hoped to find. It is true one success does not assure a permanent and accepted regime, for your trap-shooter is nothing if not changeable. It might be said that the Rose system was offered the shooting public and was not accepted, as indeed it never was, good though it surely was and is. Why should we hope for better luck for this "equitable" system? The answer seems to be that the boys were not ready for the Rose system; it seemed new and a bit hard to them, and they still clung to the old ways, and more especially did the experts, who liked the class shooting idea. Now they are coming slowly to see that shooting for another fellow's money, when the other fellow is just as good a shot as you are, is no fun. Gradually the equity of the pay-for-what-you-do system will commend itself to the shooters, and it is likely that we shall hear much more of this sort of thing after the success of the Minneapolis shoot, sharp and almost unexpected as it was, shall have become generally known throughout the land.

All the members of the club wish to give the chief credit for the success of the tournament to the quiet and hard-working president, Mr. Johnson, upon whose shoulders the greater part of the trying work of getting up and engineering the shoot seemed to fall naturally. Mr. Johnson may very well be proud alike of his club and of his success. He was aided by a good corps of other officers.

SERGEANT SYSTEM AND SHORT EVENTS.

The Minneapolis Gun Club used the Sergeant system at the tournament, two batteries of traps being in use. Another feature deserving comment is the comparatively low number of birds to be shot daily. The club found in earlier shoots that it was a mistake to make the events too long, cumbering up the day and making it hard work to run off the programme. This year only one 20-bird event was shot each day, the other seven numbers being at 15 birds each. There was added to each 15-bird purse the nice sum of $25, and to the 20-bird purses $50 was added each day; on Wednesday the millers' purse of $50, and Thursday the lumbermen's purse. In the former purse event, on Wednesday, the club added a further sum of $50 for the competition of lady shooters alone, they to pay no extra entrance. Four ladies appeared for the contest—Mrs. Shattuck and Mrs. Johnston, of Minneapolis; Mrs. Murray, of Stillwater; Mrs. Slocum, of Iowa, their scores in this event being respectively 16, 12, 8, 5. Mrs. Shattuck shot in fine form during the tournament, and on the second day in the 20-bird event retired amid applause with a straight score of 20, something which but few of the other sex were able to duplicate, as a glance at the scores will show. The other ladies shot with varying fortune, but pluckily and well.

The Minneapolis Gun Club is a very strong one, having a roll of about 150, with a weekly turnout perhaps of thirty shooters. About a dozen of the members felt strong enough to shoot through the tournament, and of these a half-dozen or more got into the list of thirty high guns, totals for the two days, to each of which was paid the average money of $5.

No very big winnings were made, and I doubt if any shooter took away over $35 or $40 for his two days' work, though a very large number got back all or part of their entrance money, so that they felt they had had sport over which they need not feel guilty when considering the question of a pair of shoes for the baby, or a box of candy for the loved ones at home.

There was a very wide representation present. There were on hand Heikes, Gilbert, Budd, Courtney, Grimm, Hallowell, the hard-shooting youngster Hirschey, now of St. Louis, and Loomis, of Omaha, not to mention a host, such as Trent, Taber, Mortensen, Robbins and others, who make hot company for anybody, in any of the several Western shoots in which their names appear. Among others from divers towns I observed Messrs. Long and Sheldon, of Mason City, Ia.; Johnson and Tryon, of Austin, Minn.; Jassoy and Sliver, of Stillwater, Minn., with Mr. and Mrs. Murray of the same city; Catamaran, Kennedy, Danz, Pfister, Roedecker, Upham and others from the sister city of St. Paul; Steege, of Waterloo, Ia.; Clark, of Nora Springs, Ia.; Bird, of Fairmount, Minn.; Robbins and Guptel, of Fargo, N. D.; Mortensen, of Britt, Ia.; J. G. Smith and Taylor, of Algona, Ia.; Day, Erbe, Pettit and Glazier, of Osage, Ia.; "old man" Thielman, of St. Cloud, Minn.; Trent and Tallman, of Wadena, Minn.; Taber, of Fairmount, Minn.; Fish, Scammon and J. A. Smith, of Eau Claire, Wis., etc.

The referees, Messrs. W. Gaines and G. E. Radley, and the scorers, Messrs. L. V. Roedecker and G. B. Hunter, did their work without the first criticism.

In the records tent Lew Harrison took care of the most artistic set of scores it has been my fortune to see for some time. The cash was kept at the office with promptness and accuracy, and above all was the blessing of smooth system.

LEADING GUNS.

The State of Iowa was strictly in the running on the first day. Gilbert kept up his even flight and broke 115 out of the 125 programme birds. Charlie Budd, who has "come to life" for keeps, tied him, and so did a dark horse, a young attorney of St. Paul by name of D. Morrison, who shot under the name of Donaldson. Heikes broke 112, thus falling just back of Hirschey and Stokes, a local man (J. C. Jogslin), who broke 113 each. On the second day Budd at one time was four birds back of Gilbert in the run for first gun, but he closed up gamely and came out at the finish only one bird behind Fred. The latter was high man for the two days, 235 out of 250 shot at; Budd second, 234; Donaldson shot with remarkable evenness, and duplicated his score of 115 of the first day, thus running third man, with 230 broken. Grimm fell one bird back of Heikes on the first day, but on the total for the two days led Rolla one bird, scoring 226. Hirschey passed both of these old-timers, scoring 227.

Following is a list of the thirty high guns, two days' average, out of 250 shot at, names given in order, $5 to each gun:

Gilbert 235, Budd 234, Donaldson 230, Hirschey 227, Grimm 226, Heikes 225, Stokes 220, Courtney 216, Worthington 215, Taylor 214, J. C., 214, Loomis 211, Glazier 211, Taber 211, Mack (J. E. Robbins) 209, French 208, Milner 206, Shattuck 206, Farber 206, Clark 204, Trent 203, Townsend 203, Hallowell 203, McKay 202, T. Kimball 201, Warren 198, Graham 197, Jinks 197, Parker 196, Wilson 196.

It was a high class shoot in every way, and the Northwest has cause to be proud of it, not only for what it was, but for what it did and what it means. Following are the scores of the two days' shooting. Sweeps were shot on Friday, which are not recorded, the bulk of the shooters having then left town:

FIRST DAY, WEDNESDAY, AUG. 24.

E. HOUGH.

Canton Tournament.

CANTON, Ill., Aug. 19.—The scores of our tournament, held in this city Wednesday and Thursday, Aug. 17 and 18, are given herewith.

We had with us Riehl and Howell, Alton; Duntley and Korn, Bushnell; McGill and Craig, Jacksonville; Jones, of Philadelphia, Ill.; Connor, of St. Louis; Sammis, Simmie, Pump, Meidroth, Nelson, Portman and Jackson, of Peoria; W. Hoff, J. Hoff and Heilman, of Pekin; Kerstetter, of Leaman; Pugh, of Abingdon; Rambo and Burnside, of Knoxville; Gardt, of Galesburg; Baker and Wood, of Kewanee; Butler, of Lewistown; McQuaid, Hulit and Thompson being home shooters.

We really expected a larger attendance; but as we offered no special inducements other than a small purse for average we should not feel much disappointed.

Our traps were arranged Sergeant system—three expert traps, 5ft. apart.

We threw 5,000 bluerocks the first day from 10 o'clock A. M. until 4:30, and laid off about one and one-half hours for a heavy rain about noon hour. In the 15-target events the entrance was $1.50; 20-target events, $2. Average money, $12, divided $7 to first, $5 to second, to two best averages shooting through the programme.

Two-men team race, $5 entrance per team, 25 targets per man, Aug. 17:

Craig	1111111111111111111111111
Jones	1111100111111111111011111—17

A very neat paper weight is that devised by the Hazard Powder Co., 46 Cedar street, New York. It is a miniature powder keg—coloring, labeling and shape complete, as in the regular kegs of trade size—and makes a very ornamental and usuful addition to the desk.

IN NEW JERSEY.

CHATHAM FISH AND GAME PROTECTIVE ASS'N.

Chatham, N. J., Aug. 15.—This afternoon's shoot was signalized by a match race at 25 live birds per man between Mr. E. A. Geoffroy, the well-known trap-shooter, and Mr. W. S. Canon, the renowned one-arm expert. That it was an off day for Canon the score plainly shows, although in sweepstake shooting he showed his knowledge of the game by killing straight in every event.

Geoffroy shot in well nigh irreproachable form, centering his birds fairly, and succeeded in shooting his opponent out in the 21st round. The birds were above the average for this time of year, as everyone who shot at them will testify. No. 1 was at 5 birds, $2, two moneys; No. 3 was 7 birds, $3, two moneys.

After all the birds were shot up the shooters resorted to targets for a brief inning.

The scores:

	No. 1.	No. 3.	No. 4.
Canon	11202—5	1112111—7	11211
Bender	12022—4	1100212—5	.....

TRAP AT LYNDHURST.

Lyndhurst, N. J., Aug. 23.—The live-bird handicap, held under the management of Mr. T. W. Morfey, had fourteen entries, first money amounting to $56; second $42; third $28; fourth $14.

Trap score type—Copyright, 1898, by Forest and Stream Publishing Co

A miss-and-out also was shot. The birds were an ordinary lot.

NEW JERSEY CENTRAL LEAGUE.

Fanwood, N. J., Aug. 27.—The New Jersey Central League held the most successful shoot of the series at Fanwood, N. J., to-day. Four teams contested for the honors, the Climax winning by the score of 89, Dunellen a close second with a score of 87.

Sweepstakes were also shot, and the event closed only when darkness made further shooting impossible. After the sport ended, about twenty-five shooters sat at table in the hotel kept by Mr. Thatcher, formerly of Thatcher, Primrose and West minstrels, and however much the amateur may be at a disadvantage with the expert in work on targets, there was no evidence of it in the work on the deliciously fried chicken, which was provided in abundance, with other good things. T. K. was everywhere, looking after everyone's comfort and pleasure, so that with so much to divert his mind and attention his scores were not up to his usual good form. In fact, his shooting was a secondary matter to his duties.

League contest, 25 targets per man:

Climax Gun Club—Swoody 22, Manning 20, Squier 20, Goodman 17, Robinson 10—89.

Dunellen Gun Club—Runyon 20, Barron 20, Lindzey 17, Cramer 16, Fletcher 14—87.

Bound Brook Gun Club—Tingley 19, Jackson 17, Merrill 17, Hoey 14, Anderson 14—81.

New Brunswick Gun Club—Booraem 20, Belloff 16, McDowell 16, Smith 15, Gillen 2—69.

Mt. Kisco Gun Club.

THE tournament of the Mt. Kisco Gun Club, held on Aug. 25 and 26, Mt. Kisco, N. Y., was not equal in size to the anticipations of its managers, but it was a very pleasant, sociable event nevertheless. The programme was not followed, the greater number of events being 10 targets, 50 cents entrance. Events Nos. 3 and 4 of the first day were team races, Messrs. Dutcher, Nelson, Sutton and Gardiner on one side, and Messrs. Foster, Gorham, Tallman and Betti on the other.

The grounds are most pleasingly situated on the edge of the town. They are level, with a good sky background. The management did everything possible for the pleasure of the visitors. The feature of the first day was the shooting of Messrs. Gardiner and Tallman.

THURSDAY, AUG. 25, FIRST DAY.

Natick Gun Club.

NATICK, Mass.—*Editor Forest and Stream:* We take great pleasure in announcing that we shall hold a trap-shooting revival for amateurs only, on the grounds of the Natick Gun Club, Natick, Mass., Saturday, Sept. 3 (the 5th, if stormy), to which we invite the shooters of the East to cooperate.

The rules governing this tournament will be noted in our programme, and may be stated as thus: "Any shooter maintaining an average of 90 per cent. or under may contest in this tournament without application to the management; if there be any question of elegibility, same can be decided by addressing the committee in writing. No paid expert or professional shooter is eligible to enter except for birds only. The management reserves the right to decide all questions appertinent to the above."

It is a well-known fact that the present condition of trap-shooting in the East is due to the manner by which the wolves have infested our locality, just as the pot-hunter has annhilated certain game districts, to the dire regret of every true sportsman.

From the outset, our intention will be to congregate all lovers of trap-shooting and treat them to a thorough amateur event, and the manner by which their interests will be preserved, we are confident, will inspire the fraternity with new life, and therefore be the means of rejuvenating the sport throughout this section. The management, as will be seen, have added to the extent of $30 in cash to be applied to the regular events; also that a merchandise event follows, in which there will be numerous liberal prizes from contributors; and all money derived from the event will be given directly to the shooters in the events following thereafter.

Thus it will be observed that, unlike any other tournaments held, the proceeds will go to the shooters in added money and not to the pockets of the management. This alone should add not less than $40 for a general average. We shall make a deduction of 5 per cent. from the regular events, to be divided by the five highest scores. We feel assured of a large conclave of shooters.

We shall leave it entirely to the shooters of the East to decide whether or not it is absolutely necessary to depend on the presence of the paid expert and professional shooter in order to successfully maintain a spirit which for the past eights years has been widely degenerating.

SAMUEL BOWKER, Manager.

[Mr. Bowker misapprehends to a certain extent the trap-shooting situation in the East. He alleges "that the present condition of trap-shooting in the East is due to the manner in which the wolves have infested our locality," etc. In his programme he alleges that "the attendance of the paid expert and professional shark has completely demoralized trap-shooting in the East," etc. "Infested" and "completely demoralized" are rather strong terms, and would seem to come under the application of the ancient adage that he who attempts to prove too much proves nothing. If Mr. Bowker will glance at our list of trap fixtures he may perhaps modify his opinion on the point in question.]

Buffalo Audubon Gun Club.

BUFFALO, N. Y., Aug. 20.—The remarkably good shooting of R. H. Hebard was the feature of to-day's shoot of the Audubon Gun Club. No. 4 is the score of the badge shoot. After making four straight scores, he broke 24 out of a possible 25 in the badge shoot. C. S. Burkhardt was the winner in Class A, Mr. Hebard in Class B, and J. E. Lodge in Class C.

The monthly cup shoot will take place next Saturday:

Events:	1	2	3	4	5	6	7

Tozier	..	..	..	..	..	..	6	7	..	..

Events 1, 3, 5, 8, 9 and 10 were at known traps and angles; 2, 4, 6 and 7, known traps, unknown angles.

GEO. F. STEVENS, Sec'y-Treas.

Rifle Range and Gallery.

Shell Mound Range.

SAN FRANCISCO, Cal., Aug. 15.—Yesterday was club medal da at Shell Mound range, and there was a good turnout of mark men. Some fine scoring was done by members of the Columbi Club, also by J. Utschig, of the Schuetzen Verein.

J. E. Gorman, in his club medal shoot, Columbia target, 10 shot 200yds., made the very fine score of 41, which means that the averag distance of each shot from the center was a fraction of over 2in Messrs. McLaughlin, Rodgers and Dorrell scored respectively 4 50 and 52, placing their shots within an average distance of abou 2½in. from the center.

A. H. Pape did some good work with the military rifle, Creed moor target:

Scores of the day:

Bushnell military rifle: A. H. Pape 48, 47, 47; C. F. Walthan 46, 45.

Members' rifle medal: J. E. Gorman 49, A. B. Dorrell 57, G Mannel 92.

All comers' rifle medal: D. W. McLaughlin 49; Dr. Rodgers 5(62; F. E. Mason 59, 62.

Champion class: Dr. Rodgers 56, F. E. Mason 77.

First class: J. E. Gorman 41, A. B. Dorrell 52, O. A. Bruner 7

Second class: G. M. Barley 81, A. Hunteman 91, M. J. Whit 100.

Third class: G. Manuel 93, C. F. Waltham 98, E. W. Moor 11 Mrs. White 145, E. Woenne 158, B. Jonas 174.

Pistol, 50yds., Columbia target, medals for members only:

Champion class: J. E. Gorman 44, Dr. Rodgers 45, A. H. Pap 46, A. B. Dorrell 52, M. J. White 68.

First class: G. M. Barley 56, D. W. McLaughlin 52.

Second class: Mrs. M. J. White 84, A. Hunteman 85, C. F Waltham 90.

Third class: J. P. Cosgrave 53, Mrs. C. F. Waltham 115.

Open to all comers, Siebe medal: G. M. Barley 60, .22 an .25cal. rifle.

Roos' trophy for ladies: A. B. Dorrell 20; Mrs. C. F. Waltha 30, 33, 38.

At the Nord-Deutscher Schuetzen Club's monthly bullseye shoo prizes were won on the following scores:

J. de Wit 307, J. Lankenau 382, Otto Lemcke 446, G. Schulz 537 L. Brune 576, Henry Stelling 683, W. F. Garms 805, W. Morke 880, Henry Meyer 968, John Thode 969, C. J. Hink 970, Fran Koch 1,166.

The San Francisco Schuetzen Verein recorded the followin scores at its monthly wedal shoot:

Champion class, John Utschig 443; first class, Nicholas Ahren 402; second class, not filled; third class, Reinhold Stettin 391 fourth class, J. W. Goetz, 381; best first shot, H. F. Lilkendey, 24 best last shot, John Utschig, 24.

At the monthly medal shoot of the Germania Schuetzen Clu the following were the best scores recorded for classes and medals

First champion class, J. Utschig 428; second champion class L. Bendel 442; first class, Henry Stelling 393; second class, E. Goetze 385; third class, W. Goetze 359; best first shot, N. Ahrens 24; best last shot, L. Bendel, 24.

ROEEL.

Cincinnati Rifle Association.

THE following scores were made by the members of the Cincin nati Rifle Association, Aug. 21, at Four-Mile House, Reading Road. Conditions: 200yds., off-hand, at the German ring target Gindele was declared king with a score of 222. Strickmier win the Uckotter trophy with a score of 224. Hasenzahl wins th Dietrich medal with a score of 67 on the honor target. Mr. V K. Dodge, of Lexington, was a visitor at the range, and put u some creditable scores with a .25-20 Marlin repeater and factor ammunition:

King score:

Gindele	21	25	22	22	25	22	22	21	18	21—22

Answers to Correspondents.

No notice taken of anonymous communications.

H. E. Ahren, City.—A letter mailed to you has been returne marked "not found."

W. S., New York.—Kindly inform me through your columns o some place near New York city where I may shoot rabbits an other small game in season. Ans. We will gladly try to help yo out when you comply with our rules. Anonymous communica tions are not answered.

E. S., Schenectady, N. Y.—Where can I get shrimp for a bas lake, and who can give me information as to planting them proper ly? Ans. Shrimp can be obtained in many, if not most, fresh water ponds and lakes. They live among the weeds, and if thes are pulled up and examined the crustaceans will be seen. The can be transported packed in wet water weeds, and will live fo days. To plant them is merely to place the weeds in the wate at the border of the pond to be stocked. The New York Fis Commission at Caledonia Springs, N. Y., will no doubt furnis all the shrimp you need.

F. W. K., New York.—I should like to know through the column of FOREST AND STREAM whether or not a rattlesnake can bit through a leather boot, and also if their bite is ordinarily fatal Are they more dangerous in the South than in the North? Roose velt, in "Hunting Trips of a Ranchman," says that he knew o but one case where any one was killed by a rattler; that wa a little girl who was struck in the ankle, I believe. This s frightened her that she fell and was bitten again in the neck He also says that ranchmen out West wear high leather boot as protection against rattlers. Ans. High leather boots, or hig canvas or leather leggings, are of course measurably a protectio against rattlesnake bite. Yet of course if the fangs of a larg snake should strike the leather or canvas at precisely the righ angle they would penetrate it, and might pierce the skin. Rattl snakes are more dangerous in the South than in the North, be cause there are more of them there, but for no other reason. Th bite would usually be fatal if no remedies were applied. As i is, a man is in far greater danger of being killed by lightnin than by a rattlesnake bite. Still a few a very few—people d each year of snake bite.

PUBLISHERS' DEPARTMENT.

THE success which meets the dealer in articles which are tho oughly good and properly introduced to the public is well exem plified in the case of Messrs. M. A. Smith & Son, of Philadelphi manufacturers of hunting boots and shoes. This firm, which bega to advertise in FOREST AND STREAM only a short time ago, find the demand for its goods so great that it is now justified i doubling its advertising space in FOREST AND STREAM. That ther is a large and growing demand for goods of this class is we understood, and the Philadelphia firm seems determined to hav its share of this trade.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, SEPTEMBER 10, 1898.

VOL. LI.—No. 11. No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

PRIZES FOR AMATEUR PHOTOGRAPHS.

THE FOREST AND STREAM offers prizes for meritorious work with the camera, under conditions which follow:

The prizes will be divided into three series: (1) for live wild game; (2) for game in parks; (3) for other subjects relating to shooting and fishing.

(1) For live game photographs three prizes are offered, the first of $50, the second of $25, and the third of $10.

(2) For live game in parks, for the best picture, a prize of $10.

(3) For the best pictures relating to FOREST AND STREAM'S field—shooting and fishing, the camp, campers and camp life, sportsman travel by land and water, incidents of field and stream—a first prize of $20, a second of $15, a third of $10, and for fourth place two prizes of $5 each.

There is no restriction as to the time nor as to where the pictures have been made or may be made.

Pictures will be received up to Dec. 31 this year.

All work must be original; that is to say, it must not have been submitted to any other competition or have been published.

There are no restrictions as to the make or style of camera, nor as to size of plate.

A competitor need not be a subscriber to the FOREST AND STREAM.

All work must be that of amateurs.

The photographs will be submitted to a committee, who, in making their award, will be instructed to take into consideration the technical merits of the work as a photograph, its artistic qualities, and other things being equal, the unique and difficult nature of the subject.

Photographs should be marked for identification with initials or a pseudonym only, and with each photograph should be given, answering to the initials, the name of sender, title of view, locality, date and names of camera, and plate or film.

SNAP SHOTS.

THE recent action of the Canadian Privy Council in placing the administration of the fisheries of Ontario in the hands of the Provincial Government will undoubtedly do much to promote the protection and increase of food and game fishes, and at the same time contribute to the further development of the important fishing resources of the Province. The privilege of controlling their own fisheries has long been desired by the Ontario people, who are now preparing to give a good account of themselves. It is understood that the fishery commissionership under the new order of things has been tendered Dr. G. A. MacCallum, who was chairman of the board that some years ago did such active work for the fish and game interests of the Province. Dr. MacCallum has for many years given much attention to fishery matters, has been active in securing the passage of measures for preserving the supply of fishes in the lakes and rivers of the Province, and is an ardent advocate of joint action on the part of the United States and Canada for the regulation of fishing in the Great Lakes. Owing to the very small compensation which the authorities have attached to the commissionership, it is reported that Dr. MacCallum has not yet seen his way to accept an appointment which necessitates the neglect of his professional duties without adequate compensation. It would seem to be incumbent on the Provincial authorities to recognize the importance of this position by assigning to it a suitable salary, so that intelligent, energetic and competent persons can afford to assume the responsible duties of the office.

The New York Times of last Sunday chronicled the feat of Rev. Dr. James H. Hoadley, of this city, who on a recent occasion in the Adirondacks took one hundred trout in sixty minutes. The Doctor discovered a pool which had been unmolested, and took advantage of the situation to make the fishing score of his life, rounding out the full hour with count fishing, keeping the big fellows and throwing back the smaller ones. Incidentally he furnished a new illustration of the principle which governs in all sports, that one is likely to do in excess that which is done easily. Some time ago we printed a story written by an Iowa contributor, who told how he had gone out for rabbit shooting, and finding the game extremely plentiful and the shooting easy, he had been unintentionally and quite unwittingly led by the combination of favorable conditions to kill many more rabbits than he had intended.

As a rule excess in the pastimes of hunting and fishing is due to the ease with which a big bag may be secured or a large string of fish counted. The shooter shoots when birds are plenty and fly to his gun; the fisherman keeps on reeling in the fish so long as there is no tedious wait between bites. The staunchest and most uncompromising censor of big bags might himself surrender to temptation when conditions fell right. There are few sportsmen who do not tell with enthusiasm of that red-letter day when they made their record score. Discuss as we may the evils of excessive killing in its effect upon the game supply, the fact remains that when chance offers the score is made; and it is the recital of a wonderful run of luck that interests and challenges the envy of those who listen. The most fish, the biggest fish, the greatest catch in the shortest time, these are the themes which engage attention at fishing resorts; they are the vouchers of "good fishing" heralded by hotel proprietors, fishing camp keepers and transportation lines. It is the string of fish painfully supported by the staggering achievers, and stretching well across the dock or completely across the side of the porch, that is put forth in photographic attestation as a signal for others to come and share the good luck. Among the people in such resorts, in particular among those who are not fishermen, one hears the characteristic comment, "He must be a smart angler to have caught so many in such a short time." This is the popular and conventional gauge of good fishing and good sportsmanship. That it is also the mistaken and improvident attitude with respect to fishing, and one to which may be traced the ruination of fishing resort after fishing resort, goes without saying, and is beyond the purpose of these paragraphs, which are intended merely to note facts and conditions.

We print to-day further communications from Mr. Chas. Stewart Davison respecting the conditions of Canadian salmon rivers, and the remedies which must be devised by the authorities if the streams are to be rescued from ruin. The salmon fishermen of this country owe a large debt of gratitude to Mr. Davison for the intelligent manner in which he has dealt with the subject, nor would it be too much to say that Canada also will be under obligations to him if his good offices shall result in leading to the restoration of these important resources.

On ten thousand farms the quail have been calling through the summer, cheering with their welcome notes the farmer in the field and the farmer's wife at home. It is not uncommon for the men and the women who own the land and live and work upon it, where Bob White whistles, to think of the quail and speak of them as "our birds." Doubtless the town sportsman who comes in the autumn to shoot the birds would also have this feeling of ownership and right if he too were the farmer in whose fields they had been bred and reared. How the landowner may feel about the birds one may understand if one will try to put himself in the landowner's place. Most of the clashing, when there is a clashing, between farmer and sportsman might be avoided if the man who seeks the privilege of shooting would consider the subject from the farmhouse standpoint.

Indeed the entire sportsman's creed respecting conduct in the field and on the stream may be summed up in the three words, consideration for others. It is this consideration which lies at the basis of our game laws and at the foundation of our rules of voluntary adoption, that in using the good things which nature yields we shall so enjoy them as not to hazard nor ruin the enjoyment of them by others, and to make the most of our privileges without infringing the rights of others, whether sportsmen or those upon whom sportsmen are dependent for the privilege of shooting or fishing. In these days of restrictions, growing annually more confined, it is no longer excusable for the individual selfishly to blunder ahead without heed to his fellows in the guild of rod and gun.

It is said that the penny-wise-pound-foolish policy in game protection, common in thinly-settled countries, now prevails in Wyoming. The region south of the Yellowstone Park, being a rough timbered country, and receiving annually the overflow of elk and deer from the Park, is to-day perhaps the best game section in the United States. The Wyoming Legislature has passed laws to protect this game, but these laws, it is alleged, are not enforced by the local authorities. No game warden patrols the country through which Snake River flows, and the deputy warden refuses to act on the ground that no salary attaches to the office; the county commissioners refuse to appoint a warden under a salary; so there is no one to look after the game, which, according to reports, has been killed off at a great rate this summer. This condition of things concerns chiefly the residents of the region where the game is found, for they are the ones who are benefited by the visits of the outside public. This public pays the residents money for time, horses, board and other services. If the game hereabouts is destroyed to such an extent that it becomes inaccessible or very hard to find by the visiting hunters, the occupation of the local guides will be gone, and a very neat slice cut off their annual incomes.

Mr. C. M. Stark, who is well informed on New Hampshire game, writes in another column of the pressing need of adopting for his State the FOREST AND STREAM'S Platform Plank—"The sale of game should be forbidden at all seasons." In this declaration Mr. Stark voices the conviction of those citizens of New Hampshire who are most familiar with the conditions there prevailing, and most earnest in providing the remedy. It is the old, old story, illustrated by scores of districts where the birds once were abundant and would be in fair supply to-day had the traffic in game been restricted to reasonable limits—which means abolished. Mr. Stark's proposition that New Hampshire shall put an end to the destruction of its game for market is sensible and timely; we trust that the subject will be taken up in earnest by the protective associations, and that a non-market statute may be among the measures striven for in the next Legislature.

In central and western New York there is much newspaper comment on the working of the new law which provides bounties for the destruction of illegal nets. The sums paid out in bounties are declared to be excessive, and a loud cry is raised that the burden on the counties is not to be endured. Doubtless there are some frauds, and money is paid that should not be paid; on the other hand the system is actually destroying nets, or in other words is accomplishing precisely what it was meant to accomplish; and the bounty funds, instead of coming out of the county treasuries, are eventually paid by the State. There are mistakes in the law, but these are not inherent in the system. They can be and will be corrected. The net bounty is all right, and it has come to stay.

By the vast majority of fishermen the grayling is regarded as a rare fish, with which they have no immediate concern; they have never had an opportunity to fish for it, and its race they deem doomed to extinction. If the artificial propagation of the grayling shall prove a successful enterprise, all this will be changed; and Dr. Henshall's report of the work already achieved in this field gives happy promise for the future of the fish.

Some Indian tribes are exempt from the game laws. The average white man, however, should be sufficiently civilized to abide by the rules of civilization, and not to class himself with the savage.

The Sportsman Tourist.

In Costa Rica Forests.

(*Concluded from page* 183.)

We had stopped to rest, and our guides had gone a little way ahead to look for signs of peccary. One of the men returned and said he had found a place where a drove of peccaries had been feeding that very morning. We lost no time in following him, and presently he stopped and asked if we could smell them, and sure enough we could smell a strong odor like that of musk. We all proceeded now very slowly, with guns at full cock. "Stop! What was that?" From the dense underbrush right in front of us came a sound as if ivory billiard balls were being struck together. A low underbrush rose waist high, so that we could see nothing, yet we knew that a drove of wild hogs were there, and might run off or charge us, as the mood pleased them. Suddenly, without a moment's warning, every little bush in front of us swayed back and forth, and such a snorting and grunting and rushing it had never been my fortune to hear. It was as if the whole woods were alive with peccaries, and as if they were all tumbling over each other to get away. How many did we shoot out of that drove? Literally none, yet there must have been 200 or more pigs within gunshot; but owing to the thickness of the bush we had not even set eyes on them. I for one was disgusted, and concluded from remarks made that the sentiments of the rest of the party resembled my own. But we were out for pig meat, and were bound to get it, if we hunted all day. After crossing a little stream, we came to the edge of a swamp, which was evidently a favorite resort for the wild hogs, as it was all cut up with hoof marks; the signs were very fresh, and our guides told us to keep a sharp lookout. Hardly were the words out of his mouth, when the German, who was in the lead, threw his gun to his shoulder and fired twice in succession. Mr. B. also emptied his gun, fairly riddling to pieces a large boar, the patriarch of the drove. I only made one shot at a small pig, but was lucky enough to bring him down, so that Mr. B. and I both had our hog. Our German friend had made a bad miss of it, but explained that when he made his shot the pigs were within 12ft. of where he stood, and he was disturbed to find the game so near him. However, two pigs were all we needed to supply the camp with meat, so we were all in a good humor once more. The big fellow, which the Englishman shot, had tusks that would tear a man's legs all to pieces. Quite often they charge a hunter, when the only thing to do is to climb the nearest tree, and quickly too, as no man could withstand their charges. The guides cut long, slender vines, which are used in place of ropes, and slung the hogs over their shoulders, and we reached camp just in time to escape a heavy shower.

That afternoon we had a visitor—a German orchid hunter, who, like most Germans, spoke fairly good English. He had spent the last two months, with the assistance of two Indians, in making up a shipment of orchids to send to England, and told us one experience he had had with wild hogs. He was alone some half-mile from camp; his gun was leaning against a tree, from which he had just descended to the ground with some orchids. Hearing the hogs, he reached for his gun, and as the peccaries came to a little place in the woods shot two of them, one with each barrel. Instead of frightening them, this had exactly the opposite effect, and the whole drove, 300 or more, charged him. He sprang for the tree near by, but had to leave the gun on the ground. In a moment they had the trunk of the small tree he had climbed all torn away with their tusks, and the ground was packed as hard as an asphalt pavement. The brutes seemed to be in no hurry to leave the sport, and when he tried to come down they charged him once more.

After an hour of this performance they left him, and when he got down in safety he told us he made a bee-line for camp. He said that when following in the wake of a drove of peccaries one would often see a tiger cat on the lookout for stragglers from the drove, but he had always found the tiger, or jaguar, a great coward. The black panther was the only exception, and would track a man, so he told us. He said he had shot one that came near getting him. He was resting after a long walk, and was sitting on the ground with his back against a log. He had been sitting very still for some time, occupied with his thoughts, when out of the corner of his eye he caught sight of something crawling toward him on the log. He quietly reached for his shotgun, which was on the ground by his side, while inch by inch the big black panther crawled toward him. The creature crouched for a spring, when quick as a flash he threw gun to shoulder and gave it both barrels at a distance of about 15ft. from where he was sitting, and killed it.

Our German friend told us of an adventure he had with a leopard while surveying for the Costa Rica Rail-Road Co. He was making a trial survey through a jungle, when without any warning he came face to face with a leopard. Both were too much astonished to move. The surveyor was frightened pretty badly, as he had no gun nor a knife of any kind, only his surveying instruments, which he made up his mind to use as a club if necessary. They eyed each other for what seemed to him at least five minutes. Some move had to be made, so he threw his arms in the air, and let out such a warwhoop that the leopard made one bound for the woods and was seen no more. After that experience he said he always wore a revolver.

The following day, the San Carlos River having risen considerably, the orchid hunter, who was glad of the swift current, which would keep him on his way to the San Juan, set out; and we bade him good-by with regret, as he was a very interesting character and had an inexhaustible supply of stories. That day we had pig roasted, stewed and fried, and found it good eating. It has rather a strong, gamy flavor, and is not so tender as our domestic pig; but it forms the main meat supply of the natives of this valley.

One of our guides had Indian blood in his veins, a common thing among the natives. The pure-blooded Indian of Costa Rica avoids the white man as much as possible. He has his thatched ranch way back in the mountains, where he grows a few plantains and yams, and perhaps a few black beans, and spends most of his time hunting with bow and arrows, or a gun, if he can afford to buy one. Clothes are not needed in the lowlands of this country, so that the men and women alike go as nearly naked as they can, putting on clothes only when they come out to some settlements to trade. They are very jealous of their women, who as a rule are far from good looking, being short in stature and of very dark skin. A few of the Indians have small ornaments of pure gold. The king of the Salamanca tribe has a gold watch and chain, but they will not tell where the gold came from. They know where the mines are, but they do not choose that any one else shall know.

This country is very rich in many ways, but is so little known that it will be years before one-tenth of the country will ever be explored. Costa Rica is one of the first coffee-growing countries in the world, most of the crops being sent to England and Germany. Rubber grows here in abundance, chocolate, the vanilla bean, cinnamon, sarsaparilla, bread fruit, rice, pepper, grapes, tobacco, beans, peaches, cocoanuts, bananas, oranges, limes, pineapples and numerous varieties of cabinet and dyewoods. For a young man with a few thousand dollars I know of no better country to which he might come, provided he did not locate in low swamp lands, but chose a situation over 1,000ft. above sea level.

One of the guides came in with a huge green lizard, which he cleaned and cooked for supper. He said that it was good to eat, but we preferred to take his word for it, and generously told him to eat it all. I was the first to awake in the morning, and was startled to see Mr. B.'s blanket stained with blood. I awoke him at once. He had exposed his foot in the night and had been bitten by a large vampire bat, which was still in the tent, and which we killed with sticks. Mr. B. was none the worse for his experience, but he lost quite a little blood. The bats are common enough here, and trouble the cattle a good deal, but seldom molest human beings. For the remainder of the trip Mr. B. slept with his boots on.

We now set out on our trip down stream, and after an hour's paddling came to where a clearing had been made along the east bank. We went ashore to buy some plantains and ripe pineapples, and in all my life I never tasted such delicious fruit! The pineapples seemed to have no hard core at all. The owner called them sugar loaf pines, and said he had so many he did not know what to do with them, as he could only sell a few. He told us that the deer were plentiful about his place, and invited us to stop a day with him and he would go for a hunt with us. His ranch house was a large one, and very well made, so we did not bother to put up our tent, but slept in the house.

That afternoon while fishing from the bank we saw the fin of a good-sized shark, and as it must have been seventy miles from tidewater we were somewhat surprised, but our host told us he had seen them quite often. The shark must have come up the San Juan River and then up the San Carlos.

Next morning we had our coffee by 5 o'clock, and quite a party of us started out. The ranchman had a banana patch within a half-mile of the house, and Mr. B. and I concluded to go with him, our German friend striking off in a different direction with the two guides. The deer of this country are very fond of ripe bananas, and they are quite often shot in banana plantations. We followed the little path to the bananas, all the time keeping a sharp lookout for game. On reaching the cultivated fields we skirted the edge of the woods, and I took a stand by a clump of bananas, the Englishman and our host taking station about 100yds. to my right and left. Then we sent a peon with his dog around to the other side of the plantation to drive toward us any deer that might be feeding there. While we were waiting the small flies or midges proved a dreadful pest, biting with a zest and spirit that reminded me of the Maine woods in July. We could not have been at our stations more than ten minutes when we heard the barking of the dog, and almost at the same instant I caught sight of a deer bounding through the high grass and making straight for the Englishman. The deer must have been within 15yds. of him when he gave him a charge of buckshot, which brought him down at once. The Spaniard also had a shot at a fawn, but made a clean miss. Glancing at my watch, I found that we had not been away from the ranch an hour. We did not cut the deer up, but took the carcass back to the house as it was.

The other party had not yet returned. Eleven o'clock came, with no sign of them.

About 11:30 we heard several shots fired off in the direction in which they had gone that morning, so I concluded to take my gun and a man and go out to meet them if possible, and to see what had kept them so long away from the house. They had gone on a rubber cutter's "picket" or trail, so that it was an easy matter to follow them.

Of the other party, the German had killed a danta, or tapir, and the two guides were loaded down with meat. My friend told me that he had hunted until 10 o'clock without seeing any game, and was on his way back to the ranch when he had come face to face with the tapir. The big animal had not offered to charge him, but had made off to a little swamp, but not before it had received three rifle balls in his body. It went crashing through the forest and they followed; and after it had gone a couple of hundred yards it had dropped dead. As I had never seen a danta, one of the guides went with me to show it. When we reached the spot the animal was lying on its side and was one mass of woodticks. I should think the body would have weighed at least 900lbs. The guides told me that sometimes they were very dangerous, and would charge a man at sight, and the man would have to be quick or he would be trampled to death. At other times they were harmless enough. The animal's hide was almost an inch thick on top of the back, but on the sides and body much thinner. I do not doubt that that night half the tiger cats in the woods enjoyed a rich feast. Some of the Costa Rica natives eat the meat. They told us it was tender and very much like beef, but we preferred to take their word for it.

I reached camp that afternoon, tired out. One cannot exercise in these hot countries without feeling the effects of it more readily than in a cool climate, and one very unpleasant feature of hunting in these tropical forests is the quantities of ticks one gets all over one's body. A rub down with rum or kerosene will take most of them off. The poor cattle suffer dreadfully from this cause; and it is necessary to wash them at times with a solution of carbolic acid and tar or tobacco water.

Our host had a pretty nice little place of some eighty acres, and raised almost everything he could wish for. He grew his own coffee, rice, beans, plantains, yams, bananas, pineapples, bread fruit, pepper and sugar cane, from which he made his sugar. He had also cows for milk, butter and cheese; and there was always the forest, where he could go for game. If he wanted fresh fish he could get it from the river at any time. Yes, a pretty nice little place, and his wife and children seemed to be contented with their lot.

We bade the good people good-by and were off once more on the smooth water of the San Carlos. There was hardly any current at this part of the stream, so that it was necessary to keep the paddles going at a lively pace. The dugouts are very clumsy indeed, and heavy affairs compared with a birch bark or canvas canoe. Time and time again we passed trees loaded down with bright orchids and creepers. Sometimes one will see a tree with half its branches loaded down with brilliant yellow or purple blossoms, which in shape very much resemble the trumpet flower, and have very sweet fragrance. We saw no game of any kind that day, and made camp early in the afternoon on a high bank some distance below the River Arenal, where there are a couple of small trading stores. There are few plantations in this part of the San Carlos Valley, and quite a large quantity of rubber is brought down the river from this point. As a fruit-growing district it is unsurpassed in the world, the only trouble being lack of means of transportation. As a hunting district it is perfect; all the big game of Central America can be found here in abundance, and the place is easily reached from San José. The river, flowing through the valley, makes it easy to change one's camp at pleasure. Nine hours down stream from the River Arenal will bring one to the San Juan River, the boundary between Costa Rica and Nicaragua. At the confluence of the San Carlos and San Juan rivers one can take the river to Greytown; and so the district can be reached by way of Greytown direct. I think the trip by way of Point Simon and San Juan is the pleasanter of the two.

It was fortunate that we had chosen high, dry ground for our camp, as it rained great guns that night; and if we had been on low ground it is more than likely we would have been washed out. By the next morning the rain had ceased, and we made up our minds to hunt directly back of camp. Our German friend was sick with dysentery, and the Englishman and I concluded to try our luck alone that morning; the guide we left in camp to tidy up and look after the sick man. Five minutes after we started we were drenched with the drip from the trees. Fortunately this part of the forest was comparatively free from vines and tangled thickets, so that we stood a good chance of seeing game. My companion shot a guatusa (a small animal resembling a rabbit in size, only larger and very good eating), but when he went to pick it up he almost stepped on the head of a huge diamond-back snake that seemed to be after the same game. We both shot the snake, and literally blew the head off his body we were so close to him. He must have been 12ft. long. He would have made a fine specimen for a museum. The fact is, one cannot hunt in this country without seeing some variety of snake on every trip; that is, if one keeps a sharp lookout, which I would advise while hunting here. The bite of most Central American snakes, particularly the culebra de sangre, or blood snake, means death in a few hours. After going about a quarter of a mile further, we came to a small brook, the banks of which were cut up like a cattle yard, where the wild hogs and danta had been. We concluded to follow the stream up a little way, and went very carefully, expecting to see game at any time. The brook widened out, forming quite a good-sized pool. Parting the branches aside, we looked out, and there on the opposite side of the pool was a danta lying on his side in the mud. I threw my gun up and fired two shots into him, but what was my surprise to see that he did not move. We went over and found that he was stone dead, and had been so for some time, although there were no marks on his body save where the two bullets had entered his hide. Probably the danta had been bitten by some snake and had gone into the brook to die. We concluded to go no further, but turned and struck back to camp in time for our 11 o'clock breakfast. That proved to be our last hunt, as we found our poor friend quite sick; and as we had no medicine with us we decided to break camp at once and start up stream. In two days' time we reached Muelle, where we had hired our guide and canoe, and the next day started back for San José and civilization. We rode mostly at night, as there was a good moon and no dust, whereas in the day the roads were hot and dusty. The third day after leaving San Carlos Valley we reached San José; we drove to the French Hotel, where we drank each other's health and said good-by; and so ended a very pleasant trip, and one long to be remembered by each of us.

I may add that a very good hunting district can be reached by going to the village of Jimenez, about fifty-six miles from Port Simon, and then striking off for the foothills of the volcano of Turrialbe; and in one day's journey from Jimenez a district teeming with wild turkeys, tigers and danta can easily be reached.

Salamanca is also a good country for game, and I believe the largest tigers are shot there; but the district is inhabited by the Salamanca Indians. They are, however, a very peacable tribe, and there are also there a few white settlers.

Costa Rica is rich in game, and there is no closed season; but the months of January, February and March will be found to be the most agreeable for life in the bush, as at that time there is less rain than at any other season of the year.

FREDERICK S. LYMAN.

Costa Rica.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Manana.

An Experience in Mexico.

A Mexican city is a noisy and a smelly place. The one in which we live (the capital of a southern Estado) is perhaps less odorous than others, but certainly is no freer from nerve-wearing noises. So it is our custom to spend a day now and then in the country. A place we often visit is San Felipe Huejotlipam (way-hote-leép-am), a little Indian town three miles away. There is a group of cherry trees near a deserted hut, and under these we have passed many a refreshing hour.

On the fifth of last May we were there again. For some reason which I do not now remember we left rather sooner than we had expected. I had unbuckled my pistol and had hung it by its belt upon a tree limb over our heads. In the hurry of getting away I left it hanging there. I missed it, however, before getting out of the town, and returned to the tree, but the pistol was no longer there. I told the friends in the nearest hut of my loss, and that I was willing suitably to reward the finder, for the pistol, besides being valuable in itself, had been given me by a friend. The story was repeated to others, and soon the news was spread throughout the little village.

We were away from home for the succeeding seven days, but on the first opportunity after our return set out for San Felipe to rest in our accustomed retreat, but having in mind at the same time the probable fate of the pistol. Sure enough, our friends greeted us with: "Have you found your pistol?" "No," I replied, "I have heard nothing of it." "Why," said they, "it was found by two little boys and carried to the Palacio Municipal."

I hurried at once to the "palace," a low adobe hut which shelters the village government. It was closed, and here my troubles began. I sought first el secretario and then el presidente in their adobe dwellings (that of the latter distinguished from its fellows by being smoothly plastered and whitewashed). Both officials were away at work, but would return "a little later."

It was now 5 o'clock, and inasmuch as there were several cases about the door of the palacio to be tried, I judged that I should not have very much longer to wait. Alas, I did not know the speed of Mexican justice. Those cases were not to be tried that night.

The last tram car leaves at 6. It was arranged that the others of our party should take that tram and that I should join them if possible. Returning to the palacio, I found the cases still waiting in charge of an unsteady gendarme, who grew more and more drunk as the evening advanced. They were expecting the officials "immediately." Six o'clock passed, with its tram. Still the cases waited, and I among them trying to tone my Anglo-Saxon impatience to something like their Southern indifference. Seven o'clock and still no officials.

Eight o'clock had already struck when el presidente, clad in the invariable white cotton shirt and trousers, appeared alone. Because I wore the clothes of civilization my affairs took precedence. I stated my quest as briefly and as clearly as I could. The old gentleman seated himself upon a brick bench outside the house, took his cigarettes from one pocket, offered them to me, and selected his own; from another pocket brought forth his matches, with that peculiar deftness which all Mexicans exhibit at this performance, lighted my cigarette and his own, exhaled a blue cloud from his nostrils, and asked me "to have the goodness to —repeat."

By the time my story was finished a second time the keys of the adobe palace had arrived. We entered by the light of a candle. After some further talk a messenger was sent for the absent secretary. This messenger returned with the word that the secretary (the polite ragamuffin) "begged that el presidente have the goodness to excuse him, as he was slightly indisposed."

"You would better come to-morrow to see what there is concerning this," was the judgment of the president. There seemed to be nothing else to do, so I moved to leave. "But, señor, will you not remain with us; how are you going to reach the city?" I was interested to make an impression, so gave verbal form to a hope which had been floating vaguely through my mind. "My servant will probably come with horses," I said. At this another messenger was despatched, who reported that no servant had arrived.

"There is nothing for me to do but to walk," I said.

"What! alone, and on Saturday night? It is impossible! The road is dangerous to-night, when there are many bad people about. I will call the ronda to accompany you."

The policeman, who by this time was far gone, was sent to find and to call the patrol. He got as far as the outer door of the garden and there lapsed into drunken oblivion. Meanwhile el presidente had been covertly yielding to drowsiness. So while I twisted and squirmed upon my chair his gray head nodded nearer and nearer the rough board table. But I must be proper; no brusqueness on my part must offend his delicate sense of "form."

At last I hit upon an excuse for sending another messenger, and then a third; but both in vain. Another weary hour had passed when el presidente, making up his mind that I would not be dissuaded from going to the city, and that he would not get to bed until I was disposed of (the other cases did not so much matter), set out with me himself to find an escort.

Once fairly started with some dozen villagers, my Yankee stride quickly covered the intervening miles and left far behind all but two of my valiant guard.

To-morrow being Sunday, I did not accept the president's suggestion. Before breakfast on Monday morning I ran out upon my wheel. This time the secretary sent word that he had gone out to bathe and so could not come. "You would better come to-morrow," said our friend, el presidente.

On the way home the conviction grew upon me that the goodly form of my pistol had entered and found lodgment in the eye of that Indian scribe, that he had made up his mind that such a pistol would be of more service to him than to me. I determined to see what aid a higher authority could lend in producing this delinquent.

So I laid the matter before a young judge, who had been studying English with me, and had shown himself very obliging upon another occasion. He holds a high position socially and has a great deal of influence in legal circles. Lucky for me this, otherwise I should never hope to see my pistol again. He grasped the situation at once, and with true Mexican courtesy offered to help me. "Have no fear, sr. director; to-morrow you shall have your pistol back again."

Since then my presence has been only a matter of form. My young judge has been interested as if the pistol were his own, and though many "to-morrows" have passed his courtesy and interest have never flagged.

His first move was to state the case to the agente del ministerio publico. I do not know that we have such an officer in our court system at home. He seems to be a sort of distributor general of the court business. All cases to be tried go first to him. He hears them, makes a careful record of all, and then disposes, sometimes sending them to a judge (whom he selects), sometimes settling them himself without resort to formal trial. This officer kindly consented to summon the secretary, and dictated an order bidding him appear in the ministerial presence at 4 in the afternoon. I was instructed to appear at the same time. I appeared, but the secretary did not. It was not until the following morning that he came, bearing a lame excuse for his failure of the day before. Such indifference to a summons from so high an authority was unaccountable to me, but not so apparently to those to the manner born.

He brought with him what purported to be a receipt to show that he had already delivered the pistol to a claimant. The signer of this alleged receipt was unknown except to the secretary himself, and the whole performance smacked of deceit. But the agente gave him an order calling upon the signer of this document to present himself "immediately." The end of the week came, but the secretary did not. Another week passed, but still neither secretary nor signer. It grew to be June 6, more than a month after the loss of the pistol, and some two weeks since I had been trying to lay legal hands upon this evasive official.

It was June 8 before the next step was taken. My friend had advised me to make formal accusation, but what was really done was the sending of another note from el ministerio, patient man, directing the secretary to appear in the afternoon to answer a formal charge. This was followed by another next morning at 11 addressed to the president, with a clause attached that if this were disobeyed el presidente himself would be arrested. At 4 the secretary appeared. I took my seat at the side of the agente, and through my friend made my declaracion, repeating the story which has gone before.

The office of this public functionary occupies what was once the choir of an ancient monastery. a long narrow hall with vaulted roof, lighted by grated windows high up in either end. Around the four walls runs a solid row of high-backed chairs, superbly carved from cedar. Half way down the right from where the low platform of the civil authority has intruded upon this holy place stands a chair, higher than the others, inclosed by a pulpit-like structure, and backed by a lofty screen rich with armorial bearings. all done with inexpressible patience in the same dark native wood.

I could not help smiling at the incongruity; this stately hall. with its memory of many an imperious Spanish bishop, witnessing the accusation by an irreverent Yankee of a degenerate son of the Aztecs for stealing a revolver.

The declaracion made, the agente called a judge (No. 4 Correccional), stated the case to him, and sent us all, judge, accuser and accused, away. In a little room opening upon the patio the declaracion was gone over again. But it was now 5 o'clock and high time, the judge evidently thought, to be going home. "To-morrow" at 10 he would hear the case. My friend offered a mild protest, thinking no doubt that the time to deal with this secretary was when you had him; but the judge's view of the situation prevailed. Then my friend arranged to represent me, so that I need not attend the following day, explaining that I was muy occupado.

Next morning I sent my servant, however. that he might be on hand to call me if need be. He returned at noon saying that the accused had not yet shown up, that the judge would wait until 1, and if still he did not appear would arrest him.

Now all this disregard of legal authority to me was appalling. It did not seem so at all to those whose authority it set aside; it caused surprise perhaps, but not astonishment.

I have not yet recovered my pistol. At this writing a whole month of mañanas has passed since the one upon which I was surely to have it again. I am beginning to think that this Spanish word, so often heard in Mexico, which is usually translated "to-morrow," really means "some time in the future."

William Sawyer.

Highways and Byways.—III.

Sometimes even the desert changes its appearance, not naturally, but artificially, and by force of external circumstances. I have just taken a trip southward for a couple of hundred miles over the Oregon Short Line. In place of the arid wastes of five years ago, there are large reservoirs and newly-planted groves, and vast hay and grain ranches. The jack rabbit and coyote have noticed the change. They have retired into the wilderness. In their places have come hundreds of teal and redheads that, dotting the little lakes and wide ditches, give promise of excellent sport in another six weeks. Doves feed about the generous stacks and sage fowl do the gleaning. But the antelopes that were omnipresent a generation ago have entirely disappeared.

Back from the railroad and beyond its terminus there is but little alteration in the landscape. There are the same alkaline and sage brush wastes, the same dreary, cedar-covered foothills, and back of these the massive grandeur of the Sevier and Mackagunt plateaus, whose immense areas of pine and spruce have been diminished by only a few acres, whose rugged slopes are traversed by only a few log roads, and dotted by only a few saw mills. Little use of a forest commissioner in this country, save as political pensioner upon a too liberal government. Under the pines, beside some unnamed spring, herders nightly build their fires and prospectors put up tents and rude log cabins. On the grassy flats the deer feed as complacently as they did before the advent of the Mormon, and among the ragged clifts of lime and lava bears and mountain lions reign undisputed in their sway.

From Milford Station a night ride of thirty-two miles brought us to Beaver, and early the next morning my companion and I were in the saddle en route for a certain prospect hole about the exact location of which there was an indefiniteness that was, to say the least, delicious. We knew that the aforesaid hole lay almost due east of Beaver, and that the stage road to Orton's was long and dusty. Hence our determination to make a new trail and hence also blankets, fry pan, coffee pot and a pack horse, which would otherwise have been unnecessary. Just outside of the Beaver city limits was Fort Cameron, an old Government post that, were it not used for school purposes, would make an ideal summer resort. It was laid out as a military park, and Beaver Creek, that bounds one side of the property, boasts a few trout. From this point there was no road, and we were as much in the wilderness as though we had been in the heart of the Adirondacks. Neither of our horses was gun shy, and we opened our trip with a couple of cottontails and a dozen doves as a game bag. The doves afforded first-rate sport, but when we dressed them for dinner we found the females were about ready for their second nesting, so we did not shoot any more.

Beaver Creek is more like an Eastern trout stream than a Western torrent. For five miles we followed it, through grassy glades and beneath dense box elders and cottonwoods, with just enough pines to add an upland picturesqueness to the scene. The waters were clear as crystal, and the banks were overgrown with mosses and liverworts. We were enjoying our trip to the utmost, when, without any warning, we ran abruptly against a cliff hundreds of feet in height. To go up its face was impossible. The creek cut a narrow gorge, with walls that reached to the sky. But the creek was now deep and angry. It was 11 o'clock; so we determined to camp for dinner, bait our horses and discuss plans. Our game was cleaned, and as we expected to make a night camp, we left the rabbits for supper. The doves were parboiled in the coffee pot, and then rolled in flour and fried with breakfast bacon. It was a great relief to find that we were not dependent upon canned goods.

Northward from our lunch ground, and skirting the base of the cliff, was a cattle trail. We rightly surmised that it was the path of the cowboy for the mountain's summit. Where a steer could be driven our horses would have no difficulty. Shortly after 1 o'clock we resumed our journey. Soon the trail grew very steep and rocky. We had a wall on one side, a precipice on the other. In one spot a large rattlesnake claimed prior right, and, as my horse refused to step over him, we had to kill him in self-defense. Box elders and the lowland vegetation disappeared. Red pines took its place. In the crevices of the rock grew a diminutive vaccinium. We especially noticed the rareness of the atmosphere. Our horses had to rest every few moments. After two hours of this work we reached the brow of the cliff. To the eastward and not far away towered the main Baldy range. The level between was a grassy park adorned with tall, straight aspens. While crossing this park our horses moved so noiselessly over the turf that we approached quite close to a beautiful buck. Daniel was for pursuit, but I reminded him that the law was not yet out, and he reluctantly gave up his purpose. The condition of this range showed that there has been throughout Utah a great decrease in the number of cattle and sheep within the last five years.

It was our intention to get as far up the mountain as possible by nightfall. Where Beaver Creek had gone we could not tell, but we expected to find springs. We did better than that, for we literally stumbled upon a little mountain lake, spring-fed, and filling an ancient crater. It was about 200yds. long by 20yds. wide—deep, clear and very cold. This we would have passed by had we not noticed with surprise that large trout were swimming among the fern-like weeds on the bottom. No matter how high the sun was, it was time to make camp, and we made camp in good shape before we paid any attention to the trout.

If there is anything that I hate in the woods, it is to be with a party that grab guns and tackle and scatter out the instant the wagon stops. Of course, they come back at dark, wet, hungry, tired, cross and generally without game, to a tentless and fireless camp. In such cases the good-natured man who has had experience, and hence remains to make things snug, gets very lonely and always feels that he has been imposed upon. So my plan is to do the necessary work, stake the tent securely, get plenty of firewood, have the frying pan handy, and then take my sport. If one gets back late it is always more pleasant to come back to a camp rather than to a heap of disordered, ill-sorted impedimenta.

We unpacked and hobbled our horses, made a shelter tent out of the two canvas sheets that wrapped our blankets, made down our bed, and gathered firewood. Then we hunted fishpoles. I had my fly-book and reel with me, but, with the uncertainty of finding a trout stream, I knew that a rod would be a nuisance. Quaking aspens are not good material for poles, and to use a drop line would be too much like fishing for porgies off the docks of Hoboken. We encircled the lake for something that would answer our purpose. We found it, and also on the shore opposite our camp the fresh tracks of a large bear and two cubs. Deer sign were too common for more than a passing glance. One little brook emptied into the pond, and along its banks grew underbrush and dwarf willows. From these we obtained a couple of 6ft. poles. Dan tied on his line, school-boy fashion, but I made guides of fine wire, and was so able to make use of the reel. In vain I whipped the waters. I could cast only about 30ft., and though I knew that coachmen and hackles landed right over the trout, we did not get a rise. How to get bait was a serious problem. There were no pines, hence no wood grubs. The few stones at the bottom of the lake were too deep for

us to turn over for the natural fish food. Neither angleworm nor grasshopper was obtainable. At length, under a rotting aspen stump we found a nest of young harmless centipedes. These, on No. 12 hooks, with split-shot sinkers completed out outfit, and we again tried our luck. This time we had better success. Dan got the first bite, and it was a good one. In vain I tried to tell him how to handle his trout without a reel. He was determined to fling it out over his head. Of course the willow snapped. If the bait had not been swallowed, he would have lost his fish. As it was, he drew it in by the hand-over-hand process. While he was gone for a new pole I secured three that averaged ¼lb. each. It then occurred to us that a mess of trout would be a great treat for the boys at the mine. We fished until the shadows grew long, and then all biting stopped. We then had thirty-seven fish. Just at dusk, after the fish were cleaned, and while some of them were frying, I heard a few splashes in the lake. Hastily changing my cast for a dusty miller and white hackle, I landed two more, the largest of the day. The sight of a mink, when we commenced fishing, warned us that we must be wary, so we suspended our trophies in a sack a few feet from the ground. Footprints found the next morning showed that our precaution had not been in vain.

With the break of day we were at the lake, but two hours of hard work brought us only enough for breakfast. While we were fishing a "cluck, cluck" revealed the presence of chickens, and Dan, being the better shot, ran for the gun. He added two broilers to our bag. They were the Western ruffed grouse (*Bonasa*), which is much scarcer than the dusky grouse (*Dendragapus*). It was a difficult matter to transport our fish, but we managed it in this way: The smallest blanket was laid on the ground, and about 2ft. square was covered with dry grass. On this the trout were laid after having been dusted with salt. (They had been wiped dry, but not washed after cleaning the previous evening.) Then came another layer of grass; the blanket was wrapped tightly about them, and this was placed in the center of the roll of bedding. The fish were apparently as fresh that night as when they first came out of the water.

From our camp we saw a low pass in the divide, and toward this we directed our uneventful way. We saw plenty of deer tracks and "kitty" tracks. Once a lynx leisurely crossed the trail 100yds. ahead. I tried to fetch him, but the bullet struck just below him, and he slunk out of sight behind the rocks.

At noon we reached the summit. It was bare of vegetation. The wind cut us with a wintry fury, and in the deep cañons on either side were banks of snow, upon which the August sun failed to make any impression. The view to the west was one long to be remembered. About us in wild confusion were piled the naked peaks, a deathly gray, save when their furrowed sides were a more deathly white. Below was the pineland; lower yet in varied agate the belts of cedar, of sage, of farms. Lowest of all, 5,000ft. beneath, stretched the desert, melting into mist at the sky line, and looking like the rolling billows of the mighty ocean. To the east was the narrow valley of the Sevier in its midsummer apparel, and beyond that, against the deep blue, the white walls of the East Fork range—the boundary of the plateau province. Almost at our feet we saw the familiar landmarks that would lead us to the mine, and by a rapid descent we arrived at the shack before the boys had the dinner dishes washed.

I wanted to return to Beaver by the same route, though our interests lay in another direction. Dan demurred. He would not even hear of our going back to the lake for another night. I insisted that, as the heaviest owner in the Coyote Gold and Silver Mining Company, I should be obeyed. Finally Daniel consented that a game of cribbage should settle the dispute. He pegged out on me. In revenge I am going to ship him to another claim, and then—I won't do a thing but go back for trout, chickens and deer.

SHOSHONE.

The Last of the Delawares.

IN the valley of the Conemaugh continued to live an old Delaware Indian many years after his tribesmen had departed to happier hunting grounds further to the west. The name of this old Indian was Joe Wipey. He lived on a small stream, an affluent of the Conemaugh, at the eastern base of the Laurel Hill, and not far from the river. A few white settlers had encroached upon the ancient demesne of the red man in this region; but Wipey was an inoffensive fellow; like Logan, the great chief of the Mingoes, he was "the friend of the white man," and lived in peace with his neighbors.

In the quiet and congenial employments of trapping and fishing, Wipey's days moved calmly along. He had given no offense, and had no reason to apprehend injury. But the trail of the serpent lay through the wilderness. The frontier difficulties known as Dunmore's War had been going on for some time, and as all wars do, it had furnished a field of operations for the bloodthirsty and the lawless. One day in May, 1774, poor old Wipey was in his canoe alone on the placid bosom of the Conemaugh. Izaak Walton himself was never less meditative of harm to any man or less suspicious of harm to himself, as from the grassy banks of the Dove he cast the seductive fly over the mirror-like expanse of water, than was this old aboriginal angler on this afternoon, as in the mighty shadow of the mountain he trolled the limpid waters of the Conemaugh.

Milton tells us how Satan from his point of vantage viewed with eyes of hate the blissful scene of Paradise:

> "On the tree of life.
> The middle tree and highest there that grew,
> Sat like a cormorant * * * devising death
> To them who lived."

Such were the baleful eyes with which two lawless rovers of the woods regarded the Indian at his peaceful task.

This is somewhat "pictorial." In plain words, Capt. John Hinkston and James Cooper discovered Wipey fishing, as we have described him, and shot him as he sat in his canoe. The body either drifted or was taken to the shore and was buried slightly under a heap of stones beside a small stream. Some authorities say that this stream was what is now called Laurel Run, on the right bank of the Conemaugh, about four miles below Johnstown; others that Wipey was killed and buried at the mouth of a tributary of the river a mile or two above. Anyhow a stream in the lower part of Johnstown, flowing into the Conemaugh, has been know from time immemorial as Hinkston's Run. It is probable that he was killed near the latter stream, and that his body floated down to the mouth of Laurel Run, where it was taken out and buried. This is the theory of my old friend, Hon. W. H. Rose, of Johnstown, who has investigated the matter, and it seems to fit in with all the known circumstances of the case.

This ruthless murder of Wipey caused great consternation among the peaceful savages along the border and a good deal of apprehension on the part of the white settlers. Arthur St. Clair, afterward the distinguished Gen. St. Clair, then a leading official of Westmoreland county, wrote the particulars of the affair to Gov. Richard Penn, and a reward of £100 was offered for the arrest of the murderers. The bones of poor Wipey "were covered" from the sight of his outraged and indignant brethren by the method so effective in removing grievances even among the palefaces. Money is the balm for every wound. What became of Cooper I do not know. Capt. Hinkston, however, figured in the border troubles long afterward, and a stream called Hinkston's Fork, in Kentucky, Dr. Lyman C. Draper informed me, was named for this same man. Gov. Penn, a few years later, was not in a position to make good his offered reward, and afterward Hinkston was figuring again in the Conemaugh Valley region, and in much the same character as before. Col. James Smith, who commanded a body of rangers in western Pennsylvania during the dark and bloody days of the Revolution, says that in the year 1778, on one occasion, Capt. John Hinkston came back from pursuing an Indian, "seemingly unconcerned, with a bloody scalp in his hand—he had pursued the Indian about a quarter of a mile, and tomahawked him." Mr. Rose says that Hinkston and Cooper were renegades, who tramped about the country subsisting principally on game. They seem to have been of that class of hunters whose prey is chiefly men. But so passed the last of the Delawares from the valley of the Conemaugh. The man that could shoot this inoffensive old Indian angling from his boat in the shadow of Laurel Hill would have the heart, or rather the want of heart, to put a bullet into dear old Izaak, whom we take to be the white lily of simplicity, piety and human goodness, as he sought shelter from the passing shower under the sycamore tree or baited his hook on the bank of the Dove.

T. J. CHAPMAN.

INGRAM, Pa.

The Ascent of the Grand Teton.

CHEYENNE, Wyo., Aug. 24.—The ascent of the Grand Teton by a party of Wyoming mountaineers has just been announced, and their success is a source of pride and gratification to residents of two States. Of the five men who made the climb, four are residents of Wyoming, and the fifth now lives in Pennsylvania, though formerly he resided in Colorado. Mr. Owen, the leader of the party, although an old resident of Wyoming, is a member of the Rocky Mountain Club, of Denver, and his achievement thus reflects credit on the adjoining State of Colorado.

The Grand Teton is the highest peak of the Teton Range, which runs north and south not far from the Idaho-Wyoming line, and thus forms the divide between Snake River, flowing out of Jackson's Lake, and the waters which empty into Henry's Fork of Snake River. It is one of the most imposing ranges in the Rocky Mountain system, and its peaks tower far above any of their neighboring fellows, almost equaling in height the tallest mountains of Colorado or of the Northwest Coast. The northern and southern extremities of the range, though high, impress one rather by the grandeur of their massiveness, but the towering pinnacle of the Grand Teton shoots up in a real rock aiguille, which reminds one not a little of the finger of the Matterhorn. Seen from the east there is a long sloping saddle which runs up toward this peak, hitherto unsurmounted by man, and below that are many mountain points, among which more than one climber in the past has become bewildered in his vain search for the actual summit of the mountain.

Many earlier attempts have been made to climb the Grand Teton, but none were successful. In 1872 the claim was made that the top had been reached, but this has generally been regarded as unfounded. In later years Mr. W. H. Holmes, of the U. S. Geological Survey, was reported to have gotten up almost to the top, and then to have met a precipice which he could not climb. Mr. W. O. Owen, who has now achieved success, tried the mountain twice before without accomplishing his object.

The party reached Market Lake, Idaho, Aug. 8, and thence drove to Jackson's Hole, where they took pack horses and traveled northward. Their camp of Aug. 10 was pitched at timber line on the great mountain, and at that time there were present W. O. Owen, Rev. Frank Spalding, Frank S. Peterson, John Shive, Tom Cooper and Hugh McDermott.

They started at 5 o'clock on the morning of the 11th and made their way up the hill, frequently meeting rock walls that could not be surmounted, and being turned back by them. As they passed on higher and higher they crossed a glacier three-fourths of a mile across, and then passed on over snow fields and over a wide rock ledge to more snow fields. At the long saddle between the Middle and Grand Teton they rested, and then made their way across the saddle up a little chimney, and on to the north side of the mountain peak. It was nervous work, for some of the ledges along which they had to pass were so narrow that they were obliged to crawl on hands and knees or even on their breasts.

One thing that happened must have called into their throats the hearts of all the climbers. A great rock became dislodged from a point above them and fell down directly toward Shive. It bounced to one side, however, but passed near enough to him to touch the brim of his hat. Above this point they came to more ice, and then more snow, and finally, after passing over the rock fingers so noticeable from below, they reached the summit at precisely 4 o'clock. They had been climbing for eleven hours.

On the pinnacle of the mountain they planted the metal flag of the Rocky Mountain Club, and in a copper box, half-buried among the stone, inclosed the record of their achievements. Then after a short stay, fully occupied in studying the wonderful panorama laid out beneath them, they began the descent.

As is usually the case in mountain climbing, the descent was more difficult than the ascent, and the men found more use for their rope and their ice axes in going down than they had in climbing up. The four men who reached the top were Messrs. Owen, Spalding, Peterson and Shive. McDermott and Cooper did not go up all the way. The summit of the mountain was found by the aneroid barometer to be 13,800ft. above the sea level. Messrs. Owen and Spalding each carried a camera, and together secured about one hundred fine photographic negatives.

Their time on the mountain top was so short on the 11th that on the day following Messrs. Spalding, Peterson and Shive made another ascent to finish the work of building the monument, and to complete the record of the climb.

On his way out of the Jackson's Hole country Mr. Owen met T. M. Bannon, a surveyor and one of the topographers of the U. S. Geological Survey, whose work this summer has been in that country. He told Mr. Owen that a few days earlier he had seen sun flashes on the summit of the Grand Teton, and had imagined that some one was trying to signal to him by heliograph. On studying the mountain peak with his field glasses, he distinctly saw the monument which had just been erected by the Owen party. The flashes were undoubtedly from the metal flag which had been planted there.

The credit for the successful accomplishment of this achievement belongs principally to Mr. Owen, who has several times before attempted the Grand Teton; but, as already stated, this accomplishment reflects as well on the Rocky Mountain Club, of Denver, of which he is a member. This organization was established no longer ago than 1896, for the purpose of exploring high and unknown mountains. It has a considerable membership in Colorado, Wyoming and other Rocky Mountain States.

WYOMING.

The Witch-Like Rapids.

THAT was a felicitous description of rapids Mr. Burnham gave in his Yukon notes of Aug. 27, when he wrote:

"Of a sudden the damp, misty gap opens, and in place of the smooth surface a long vista of leaping, ghost-like masses of foam. These have the peculiarity of appearing and disappearing always in the same place. They do not advance like ocean waves, but at one particular and unchangeable spot execute fantastic movements, witch-like, uncanny genuflexions, wavings of phantom arms, turning and beckoning, forever repeated in the same unvarying way."

Natural History.

The Yellowstone Park Bears.

GARDINER, Mont., Aug. 24.—Bears have been very troublesome in the Park; that is the grizzlies, for the blacks know how to behave themselves, and are willing to let well enough alone. The grizzlies have been killing sheep and smashing in doors, jumping into high pens and helping themselves generally to what they have no right to. "Doc" was out with a party, and at one camp they stole a ham and some other things. The next night all hands slept around the "grub pile." At one time three bears were standing around waiting for a chance for supper. At Norris one bear was so very bad they ordered him shot; and Scout Burgess did the business for him. Scout Morrison went out to Klamer's slaughter house to kill two very troublesome grizzlies. It is nothing unusual for bears to rob camps and even wagons with people sleeping in them.

Capt. Erwin is making a large enclosure in front of the Mammoth Hot Springs Hotel and Fort Yellowstone, for the elk left here by the National Zoo. He intends to have other animals kept here for visitors. As it is now, nine-tenths of the people visiting the Park see no game except chipmunks and bears.

E. HOFER.

CHICAGO, Aug. 27.—Mr. Harry Hoffman Valentine, of Poughkeepsie, N. Y., is taking an extended trip with his wife over parts of the Western country, and this week came into the FOREST AND STREAM office to inquire about some muscallunge fishing up in Wisconsin, to which I hope he received proper directions. He goes in at Manitowish, in charge of Fay Buck, and I think will have sport.

It was Mr. Valentine who told me a rather curious story about the bears of the Yellowstone Park, from which region Mr. and Mrs. Valentine have just returned, having fished and traveled over a good part of that wonderland in the brief time at their disposal. At the Fountain Hotel, where they stopped over night, there was the usual spectacle of wild bears coming about the hotel in the evening in search of food at the offal heaps. There were six or more of the bears visible during one evening, though no one living at the hotel paid much attention to them. There was one young lady at the hotel who was in search of experience, and she persuaded the driver of one of the garbage wagons to allow her to ride out with him to the place where the garbage kegs were emptied—this being the place where the bears were sure to be approached most closely. Sure enough, the bears were there, among them several silver tips. One good sized black bear

reached up into the rear end of the wagon and pulled out one of the barrels, not waiting for the driver to roll it off. Yet another bear came up to the tail gate of the wagon as the driver went back to roll off a barrel of garbage, and as he stooped over the bear gave a nasty growl and made a pass at him with one paw. This satisfied the young lady who was looking for experience, and she crawled out on the wagon tongue, as far away from the bear as she could get. Not so the driver, however, who was very much angered at this impertinence on the part of a mere bear. Reaching back into the wagon, he caught up a seat board that lay at hand, and brought it down on the bear's nose with a smash that nearly put the old fellow out for awhile. As the bear recovered some idea of what was going on, he pulled his freight for the woods as fast as he could go, bawling in the most aggrieved tone of voice. There is nothing like teaching a silver tip his place.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Animal Intelligence.

Editor Forest and Stream:

Your correspondent, Mr. E. P. Alexander, in FOREST AND STREAM, July 23, gives us several columns of argument under the head, "The Origin of Animal Instincts."

The theory advanced, in its main features, is an old one. Stripped of its deceptive verbiage, it stands for a fixed and special creation, by a designer who not only designs, but assumes complete control of the thing designed. It denies reason to the lower animals, and claims that nature as now constituted was designed in the beginning.

The writers who maintain this theory adopt the same methods, the world over, in exploiting their views. They ridicule and misstate the views of opponents. They accept no evidence unless it is indisputable. Because their opponents do not improvise and name a creator for nature, they shout "chance world." There are no secrets in nature to this class of writers. They produce a being self made, who created all things, and with the greatest sangfroid give this imaginary creature a grandiloquent title, and then call on their opponents to name a superior being or forever remain silent.

They make use of a mass of verbiage that confuses and dismays the untrained mind. Their bald assertions are something wonderful, and their similes are trumped up fakes. Their arguments are illogical, conflicting with the knowledge acquired through our senses.

Your correspondent easily belongs to this class of writers. He adopts all the tricks known to the brotherhood. He laughs to scorn the accounts in FOREST AND STREAM of animal intelligence and communication. He holds Mr. Mather's opinions up to redicule, and misstates his theory of inherited caution. He contradicts his own theory in numerous instances. He makes reckless assertions—assertions that cannot stand in the light of reason. Referring to Darwin, he makes pretensions that are glaringly false. Finally he conjures up a being that he nicknames "sub-ego" and calls upon us to accept this mythical being if we cannot produce a superior.

He is guilty of a contemptible trick when he substitutes the word chance for evolution. He knows, or should know, that no reputable writer on nature ever used the word chance. Chance has no place in nature. Chance is something that happens without a cause. Nature has a cause for everything that happens. In an argument containing over 3,000 words, not once is the word evolution used, chance is substituted. Do we know the meaning of this trick? Certainly. It means that the writer tries to convey the impression that those opposed to his theory believe in a chance creation, a chance world. It is the only thing that would make his theory respectable.

He poses as Darwin's defender. Would have us believe that he is a disciple of Darwin, while there is not an idea in common between them. He believes in a special creation. Darwin believed in evolution. He believes that all variations in nature were designed from the first. Darwin believed that selection and environment produced variations. Darwin claimed that acquired characters were transmitted. Your correspondent believes the contrary. He cannot palm himself onto us as a Darwinian. We bar wolves in sheep's clothing.

To show what kind of a theory this writer advances, I will quote his recapitulation:

"To recapitulate. Individual acquirements are not transmitted to posterity. Chance could no more produce the creation we see than the newspapers we read. Practically a blue print of every species preceded its first appearance. A sub-ego precedes every ego, superintends its entire life, and imparts all necessary race instincts, and finally there is in some manner the equivalent of telepathic communication between sub-egos of the same species."

It will be noticed that the word chance is here substituted for evolution, as it is throughout the article, and the word is used seventeen times. If he had used the word evolution, his argument would have excited derision only.

Your correspondent seems to be somewhat mixed in relation to his imaginary beings. He starts out with the claim that nature was created and is controlled by a power which he calls "the centrifugal force of nature." But afterward he seems to substitute "sub-ego." There appears to be a multiplicity of "sub-egoes," as every "ego" has one. It is just possible that he may claim a "centrifugal force" and "sub-egos" also. If so, I do not know why, for he gives the two forces the same powers. I can quote from his paper to prove this, but it is not worth while, as I shall deal mostly with his "sub-egos."

Let us see what Mr. Mather advanced that roused our sleeping lion to action. He says: "An old trout often pricked learns caution and transmits that quality to its progeny. The heedless young trout takes the first lure, and has no progeny to transmit its rashness to." Again: "There is no instinct in it; it is reason pure and simple. The wounded that survived learned a lesson and transmitted it to their posterity."

Right here I want to thank Mr. Mather for the sentiments expressed in these quotations. They embody the views of the best scientific writers of the present day. He grants reason to the lower animals, and so does every thinking mind that studies them.

Your correspondent makes light of Mr. Mather's conservative statement. He claims that Mr. Mather's theory should cause a duck to transmit the knowledge of a wooden duck, and a trout the knowledge of the identical hook by which it was pricked, maker's name also, I suppose. Thus do such writers ridicule and belittle the opinions of their opponents.

When I first came to Cape Ann, I wondered much at the wariness of the robins, but I soon found a reason. They were persecuted by gunners. In Maine, where I had lived, the robins were very tame. If I approached a nest the young birds would call to me with open bills. I could stroke them, and they were apparently without fear. Here if I approach a nest and the birds are not large enough to fly, they crouch to the bottom in silent terror. Time and again I have had them break in terror from the nest. These young birds know nothing of the gunner. How do they come by their wildness if they do not inherit it?

Now here comes your correspondent and explains everything by his beautiful theory of "sub-ego." How simple it is. Each young robin is attended by a "sub-ego" that looks after its welfare. When I approach a nest the alert "sub-egos" jump on the young robins and jam them down to the bottom of the nest. Or, if they are about ready to fly, the "subs" yank them out of the nest and kick them under the bushes out of sight.

Shake, Mr. Mather, we are enlightened!

Your correspondent tries to fit two opposing ideas into one theory. A creation by evolution and a fixed creation. He knows that the readers of FOREST AND STREAM are aware that endless variety and new forms are features of nature, so he explains that to his force, or being, we owe all the natural forms in nature. He says of this force:

"If a simple access of wariness and caution is not enough, a new sense or a new organ are not beyond its powers." Notwithstanding this plain statement, in line with evolution, he coolly proceeds to advocate an opposite theory, which he calls a "blue print theory." This theory he illustrates by selecting the venomous serpent, stating that one illustration is as good as a hundred. He claims that the venomous serpent is not the result of the variations of the serpent type. "There must have been a blue print of him before there was a venomous serpent."

How inconsistent. In his first proposition a species can be changed by a "new sense or a new organ." In his second proposition species are fixed, immovable, a "blue print" must precede each individual.

Your correspondent can only be classed with the writers who claim that the differences in nature came into existence full-formed. They claim a special creation by an intelligent being, who is self-created. To maintain this theory they must deny reason to the lower animals. They must deny evolution, and that acquired characters are inherited. If they should accept inheritance, they could not deny evolution. If you prove to this class of writers that certain acquired characters are hereditary, the answer would be that of Weismann, to the effect that if the characters were hereditary they could not be acquired characters. Through such loopholes do these writers escape from facts.

I quote once more from your correspondent, to show the weakness of his argument:

"I am not denying the value of cross-breeding and selection in producing the highest possible development of all natural instincts, abilities or powers, or any natural variations of any physical form."

No, he does not deny these phenomena in nature, simply because he knows that they are well known to the readers of FOREST AND STREAM, but he gives his case away when he accepts them. Selection and cross-breeding are for the purpose of transmitting desirable characters, and prove the theory of heredity, and also prove that evolution is a demonstrable fact.

I saw to-day proof of an inherited character in a cat. The cat had two extra toes on each foot. These cats with double feet are not uncommon in Gloucester. The double feet are transmitted to some of the offspring when either a male or female is mated with a common cat.

Mr. Alexander has placed his theory before the wrong class of readers. The readers of FOREST AND STREAM are no dime novel lunatics. They are in close touch with nature, and they know that evolution is a reasonable theory. They know that the lower animals can reason, and that they can communicate with each other. They are led to these conclusions by the actions of the lower animals, which are capable of no other explanation.

If men are told that the Brooklyn Bridge is unsafe, and they take some other route to escape danger, we say that they are guided by reason.

If birds, in migration, fly outside to escape the danger from the gunner, why not grant reason to the birds?

When we are among foreigners, by their actions we know that they can communicate with each other, although we cannot understand a word. Why should we deny to animals the same power, when their actions are equally as suggestive?

If one was inclined to adopt Mr. Alexander's "sub-ego" theory, and possessed a logical mind, he would want a creator for "sub-ego," which he could call sub-sub-ego, and yet another which he could call sub-sub-sub-ego, and so on, one being above another until he either landed in the grave or a lunatic asylum.

Back of the germ of life, with all its possibilities, there is a mystery which we cannot solve, and may never solve. It is useless for Mr. Alexander to solve the mystery for us with a being who proceeds to create himself and then to create nature.

HERMIT.

GLOUCESTER, Aug. 12.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Through Texas Blackjacks.

THE professor wanted a kangaroo rat and he invited me to spend a few days with him, and we would drive together to the ranch of a friend of his in the blackjack country below San Antonio and try to get one. I may as well say at once that we failed as far as the main object of the expedition was concerned, but we saw so many forms of animal and plant life that were new to me that I found the trip exceedingly interesting, and hope that a short account of it may prove so to others, who, like myself, may be fond of natural history.

On the morning after my arrival at the professor's house, while he was busy getting the buckboard and pony ready for the journey, I sat on the gallery and smoked my pipe, and watched the cactus wrens hopping about in the Bermuda grass collecting materials for nest-building.

A wren about the size of a mockingbird was something quite new to me, and as they were very tame and came within a few yards of the gallery I was able to get a good view of them. There were two or three of their bulky, domed nests in sight, and they were very conspicuous in the thin, feathery foliage of the mesquite trees, but none of them had eggs in them, and the professor said that each pair of birds made several nests without laying in them, and in fact they were such industrious architects that the whole season through they could be seen just as they were that morning, hopping about the garden with bits of grass in their beaks.

I was still watching the wrens when the professor shouted that the buckboard was ready, and in a few moments we were rattling along between the mesquite trees on our way to the Medina River.

There had been a rain a few days before, so the road was not as dusty as usual and the day not unpleasantly warm. Mockingbirds were singing by the hundred, and Cassin's sparrow was warbling its quaint little song. Birds' songs as a rule are somewhat alike; almost every bird reminds one of some other in some of its notes, but Cassin's sparrow is an original; at least I have never heard any song that resembles in the least its cheery little ditty.

The first part of our road lay through a level mesquite country that used years ago to be bare prairie. A mile or so to our left a dark line of live oaks and other tall timber showed the course of the San Antonio River. The track was fenced with barbed wire an each side, and there were not many houses near the road, as they are built further back, by the river, to be near water. The mesquite country is a stock country, purely and simply, and farming it is of little use without irrigation. After a while, however, the mesquite trees become fewer and the chaparral thicker, and here and there we passed houses and fields, the houses often surrounded by retama trees ablaze with golden blossoms. Huge clumps of prickly pear in full bloom made gorgeous patches of color. At my ranch, about 100 miles to the northwest, the "pear" blossom is always yellow, but here it was just as often a brilliant scarlet.

The so-called chaparral is composed of a number of dwarf stunted shrubs, mostly covered with thorns, such as catclaw, dwarf hackberry, brazilwood or black chaparral and lippia or white chaparral, whose feathery blooms supply the bees with splendid honey—a yellow-headed tit's nest that we found by the roadside was lined almost entirely with these soft blooms. Here and there a Wisatch tree rises above the brushwood, and in one of these we saw the new nest of a pair of Bullock's orioles hanging within a foot or two of the dark, dis-colored nest of last year.

Among the chaparral, besides the yellow-headed tits, we saw the Texas cardinal, distinguished from his cousin, the common cardinal, by his thick, light-colored beak, long, slim crest and claret-stained breast, and also the curved billed thrasher, locally known as Mexican mockingbird; his song is very like that of the common mocker when he condescends to sing his own song, but as we thought even sweeter and mellower.

In a small open space, quite close to the road, lay the body of a dead horse—by no means an uncommon sight by the side of a Texas highway—it had not been long dead, but a turkey buzzard and a caracara or Mexican buzzard had already found it, and having made a light lunch of its eyes were waiting about for the rest of it to get tender. Though these birds are so similar in their repulsive habits, they are by no means alike otherwise, the caracara being a handsome fellow, with dark mantle, white black cap, yellowish cheeks and ugly looking the turkey buzzard is just exactly the unsightly wretch that he naturally ought to be; this of course only when he is on the ground; one has a great respect for him when he is soaring about overhead, with that grand tireless flight of his that apparently takes him wherever he wishes to go, down wind or against it, without any other effort on his part except perhaps an effort of will.

At last we came in sight of the tall timber that fringes the Medina, and the professor pointed out the neat brick chateau of a French friend of his on the rising ground across the river, where he said we would stop for dinner. Soon our pony was picking his way over the long wooden bridge. We rattled through the little village on the other side, and before long were being welcomed at the ranch. Before dinner we strolled down to the vineyard, where the young grapes were just beginning to form, some of the bunches being nearly a foot long. Our French friend had been spraying the vines to prevent "black rot," and the leaves had a dull purplish cast in consequence. He told us that when the fruit was ripe he had to wage constant war against the mockingbirds, and had killed as many as 200 in one week last year. There seemed, however, to be plenty of them left.

Our friend had been in the country for forty years, and was full of anecdotes of the old times. Though seventy-nine years of age, he was as straight as an arrow and as neat as a blackbird (there is nothing neater than that). Moreover, he was hospitable as an Arab, and decided to go with us after dinner and spend the night at his son's ranch, some seven or eight miles off, where we would be nearly sure to get the much desired kangaroo rat.

In the yard close to the house we found a cactus wren's nest containing four yellow-freckled eggs, and in a large cactus was the nest of a Mexican mocking-

bird with three newly hatched young ones; the old birds were very tame, and we got a good view of them, the nest was very like a mockingbird's, but made of rather finer materials.

When we had dined and rested for an hour or so, we started again, and after going about a mile reached a strip of what is known as the blackjack country, the timber being mostly blackjack and hickory, and the soil a fine white sand. This sand made hard work for the pony, so the professor and I got out and walked, while the old man drove. Walking was by no means easy, as we sunk to the ankles every step, but we took our time about it, and found much to interest us on the way. In one place would be a number of little round heaps of sand, thrown up by the gophers; in another queer little earthworks wound about in the somewhat scanty herbage, showing where the moles had been at work just beneath the surface of the ground, and now and again we found the larger open burrows of the kangaroo rat.

Birds were rather scarce among the blackjacks, a few Carolina doves and beebirds being about all we saw; but the wild flowers were numerous and very beautiful. The old man told us that every rain brought out a different lot of flowers.

One would think that scarcely anything would grow in the fine white sand, but it is always damp a little below the surface, and we were told that melons and sweet potatoes were always a good crop, and that in a dry season—and dry seasons are the rule—corn and cotton did better in the sand than in the best of the so-called chocolate land, and in fact we passed one or two fields where the corn was looking very well indeed.

After a hard tramp of about six miles we rather suddenly came to the end of the blackjacks and hickories, and the country was more open and park like, with scattered clumps of huge live oak trees, overrun with enormous mustang grapevines.

The flowers here were very lovely; in one place would be acres of large white daisies, and a little further on large patches of yellow blossoms, while here and there by the side of the sandy trail the Mexican lanterna glowed like a camp-fire. This is a charming little flower, something like a verbena in shape, but with flame-colored and scarlet blooms mixed promiscuously in the same flower head.

The sand was not so deep when we got well clear of the blackjacks, so we mounted the buckboard again, and driving for some distance through a lane between flourishing crops of corn and cotton arrived at the ranch where we were to spend the night. This proved to be another neat brick house, owned of course by another hospitable Frenchman with a German wife and a whole host of pretty daughters. We were greeted with a hearty welcome and a bottle of good wine, and after a short rest went out to set our rat traps.

The field by the house had been quite recently cultivated, and we only found one likely looking burrow, where we set a bed of traps. After supper we walked about two miles through the sand to another field, where the rats were supposed to be plentiful, but although there was a good moon we found no sign, so tramped back again, keeping a good lookout for rattlesnakes, and after a pipe or two retired to a well-earned rest.

Before sunrise the next morning we visited the traps, but found that none of them had been sprung. We found some better burrows than any we had seen the evening before and made an unsuccessful attempt to dig out a rat. As we had not time to stay another day, we left the traps and instructions with our host, who has often got specimens of various kinds for the professor, and started on our return journey.

We reached the old man's ranch by noon, after a tiring walk through the sand under a burning Texas sun, and after dinner took the road for San Antonio, arriving at the professor's house in time for supper, tired, dirty, hungry and, alas, ratless, but having nevertheless thoroughly enjoyed the trip. PURBECK.

Another Animal Pet.

NEW YORK, Aug. 18.—*Editor Forest and Stream:* Some twenty years ago my father was the proprietor of a large private hospital in Germany. The property was situated near one of the largest forests in that portion of the country, and although Brother Fox is now no longer to be found there, at the time of which I speak he reigned in all his glory and caused a perpetual decrease of our chicken family. They became so obnoxious that we were on a constant hunt for them, and although we killed many for a long time I never succeeded in capturing one alive, which was my greatest desire. However, one day on a fox hunt we discovered a fox hole, and to my delight it contained two young ones. They were probably a few weeks old and the prettiest little specimens of the fox family I had ever seen. We took them home and kept them in the house for about two months, when they became too frisky and full of mischief, and we dug two holes in the garden, placed a small barrel in each of them, and that was the home of my two foxes after that. They were tied to a stake by a long chain. Fritz, the male of the two, seemed quite content and happy, but Hedwig, his mate, would take no food or permit any one to go near her, it made no difference whether we made her free or not, and she at last became so fierce and surly that she had to be shot.

Fritz flourished, and the larger he grew the more he loved mischief and the more did we children adore him. If a stranger went within range of Fritz's chain he could rely on losing a part of his trousers, although the fox was always careful not to bite. My father gave strict orders that Fritz was to remain chained at all times, but the moment my father went to the city we would charge on Fritz in a body, loosen his chain and romp with him. He would never harm the children, but delighted in knocking us over by running against us; he was like a big dog and we treated him as one. But, alas! Fritz had not overcome his fondness for chickens, and one day in my father's absence, when we had removed his chain, he saw the open gate of the chicken yard, and before we could stop him he was among them, with the result that when the gardener succeeded in dragging him away seven of my mother's favorite hens were found dead. Of course my father heard that we had freed Fritz, and we received what we justly deserved. Thereafter Fritz remained chained.

Among the patients in the house was an old man, who, besides being insane, was naturally a crank, and poor Fritz was his special aversion, for whenever Mr. Meyer passed, the fox attempted to play with him, as he did with us. One day as Meyer was passing by the fox's retreat he was suddenly made aware that Fritz was pulling at his trousers (I am sure it was merely to call his attention), which liberty so angered the old lunatic that he took the silver-headed cane he always carried and knocked in the brains of our playmate and friend.

B. L.

The Black Bear is Shy and Sly.

BREWER, Me.—I have been very close to bears when they were wallowing in spring holes or picking berries; also so as plainly to hear them tear logs in pieces; but my experience is that they are as shy as any animal we have. I have watched moose and caribou and deer and otters and mink and foxes and many others, but I never had a chance to watch a bear. I have several friends who have seen bears watching them. Often on hearing a person one will climb a tree, and keeping its body on the dark side, will watch persons as they pass. Undoubtedly a good many bears here seen me which I never saw nor suspected were near me. I have known them creep up to watch a person calling moose in the daytime. M. HARDY.

Game Bag and Gun.

The "Brief's" Pictures.

THE illustrations in the current edition of Game Laws in Brief, Mr. Charles Hallock says, well represent America's wilderness sports. The Brief gives all the laws of the United States and Canada for the practical guidance of anglers and shooters. As an authority, it has a long record of unassailed and unassailable accuracy. Forest and Stream Pub. Co. sends it postpaid for 25 cents, or your dealer will supply you.

New Hampshire Game

And the "Forest and Stream's" Platform Plank.

DUNBARTON, New Hampshire.—*Editor Forest and Stream:* In this part of New Hampshire we depend almost wholly on the ruffed grouse for our fall shooting. We had formerly a fair number of woodcock, but I find them growing very much scarcer each season. Our grouse have stood it much better, and we have to-day a fair supply. It has been stated within the last two years, at meetings of our game protective associations, that our grouse were increasing, or at least holding their own. I do not agree at all with the above. For years I have said the grouse were decreasing each year, and the cause it too much shooting, the same as it has been in other parts of the country with various kinds of game.

For thirty years I have hunted more or less each season over miles of ground in this section, and there is not a month in the year in which I do not see some of our game birds. In times long past many of my neighbors, men and boys, went gunning more or less, but very seldom did they shoot at anything on the wing. Gray squirrels were what many of them were after. A few grouse were killed almost invariably when on the ground, or sitting in a tree. Of course, even then there were some good wing shots, but they were very few. To-day things are different. Every man and boy who owns a gun is some sort of a wing shot, and very many are quite expert. In those days our game was not protected to any extent, as compared with the protection it gets now. Some grouse were shot long before the season opened, and all through the wintry months, when budding; also some snaring was done. Yet I feel confident that fully as many, if not more, are now legally killed each season, certainly a larger number comparing the supply then and now. To-day it is quite safe to say, that on almost any day during the open season there are at least ten men hunting, who are pretty fair wing shots, where there was hardly one years ago.

Our game laws to-day are good and well enforced. Never in all my experience have I known of so very few cases of shooting out of season in this section as during the past two years. The members of our Fish and Game Commission are energetic in following up what is often very vague information of illegal shooting. Mr. Wentworth, of the commission, is a first-rate man for the position he holds. The way in which he has followed up some cases has had a very wholesome effect on many would-be violators of the game laws.

A few deer are seen now and then in this section. I am quite sure that to-day there is a large buck not far from here. He could easily have been killed, and would have been had it not been for fear of detection.

There are years now just as there have been in the past. Such, I have good reason to think, is the present year. I have seen more broods of young birds during the past summer and some of my neighbors report more than for several years. Such increase, however, I consider as only temporary. It is somewhat similar to a trout brook which has been closed for a term of years. At the opening trout are quite plenty, but the closing has practically advertised that particular brook, and almost invariably by or before the first open season closes, the brook is in no better condition, if as good, as when first closed, as far as containing trout. The same with young grouse. The army of wing shots will hunt all the more, and the increase of a better breeding season will last but a short time.

Our game laws, as I have said, are good; they are good as far as they go, but there is one point which they do not cover, and that is the sale of game. It is true we have a non-export law, which prevents the open shipment of our game to that general dumping ground, the Boston market. Yet some of our game gets there just the same, and many a dealer who received it is almost, if not quite, willing to swear that it came from that indefinite location, "out West."

What we want, and what we should have in New Hampshire, is the adoption and enforcement of the Platform Plank of the FOREST AND STREAM, prohibiting the sale of game at all times and in all places. Such a law, it is claimed by some, would be too arbitrary. It will interfere with the market shooter, who to-day is killing ten times or more than his share of what game is left. It will interfere with the man who does not own a gun, and who knows nothing and cares less about preserving our game. He wants to buy from the dealer, no matter when, where or how it was killed. It will interfere with the game dealer, whose only interest is in the profit he makes.

In times of long ago the supply of game in very many parts of the country was considered practically inexhaustible. Any law then to prohibit the marketing of game would have been considered entirely unnecessary. What has been the result, and what has become of the inexhaustible game?

Something over a year ago a proposition was made, saying that what New Hampshire needed were game preserves, that every owner of land should own and control all game on the land, and only those should be allowed to shoot who would pay for the privilege. This proposition was met at once with most decided disfavor. To most of us such a law meant that a few men of means could control a great deal of ground completely, excluding from almost any chance of shooting many who could not afford to lease any ground. The plan proposed by the FOREST AND STREAM does not bar any one from shooting. It proposes to make it less of an object for the market shooter to follow up the game day after day. Some of the market shooters say that they will shoot just the same even if they cannot sell what they shoot. Possibly some of them may. In all probability none of them will. The majority of them could not afford to spend the time they do now if there was no chance of getting some money out of it.

A large majority of the sportsmen of New Hampshire of to-day are interested in preserving our game, to them belongs the credit of our game laws now in force. Most of them are satisfied to bag a few birds in a day's outing. Few of them make large bags often. Many of them could not if they would. The market shooter can and does and will, as long as there are birds to be found.

In times long past, when the supply of game was thought to be inexhaustible by legal shooting, many a sportsman who was a good shot made large bags. Some of them sold a part of what they killed. Considering the scarcity of wing shots and the supply of game then, the sale of a part of what was killed hardly classed a man as a market shooter. Had conditions not changed and were the number of good wing shots no greater, the game to-day would no doubt compare favorably with the former supply.

I think the experience I have had furnishes a practical illustration of what I wish to convey. Twenty-five years or so ago I owned the only trained setter in this vicinity. I had almost all of the shooting about here. I knew of a number of woodcock covers. I could hunt them over twice a week or so, usually finding quite a number of birds whenever I hunted. I could leave some birds in a cover, knowing I could go there again in a few days and find them, and very likely some more which had come in. I also felt quite sure that no one else would disturb them; and it was the same with broods of grouse. To-day there are a few birds to be found on the same grounds, but I am fortunate in not finding some one there ahead of me on any day I go there. Instead of seeing quite a lot of borings and other signs of the birds, I am more likely to see empty cartridge cases scattered about.

Doubtless, even under present conditions there will be for years to come some grouse in this section; they are not so easily exterminated as some kinds of game. Nevertheless I am sure that had the motion proposed by the FOREST AND STREAM been put in force in New Hampshire ten years ago, there would have been a very much better supply of birds to-day. Adopting and enforcing it now will, I am sure, be of great bentfit to our future supply.

Other States are realizing the necessity of the FOREST AND STREAM'S Platform Plank. New Hampshire will not be one of the first to adopt it. Let us hope it will not be one of the last.

C. M. STARK.

Quail, Ducks, Turkeys and Squirrels

WILLIAMSBURG, Ind.—One hundred and twenty miles below St. Louis, on the mighty Mississippi, is Neely's Landing, Mo., a quaint little hamlet, nestled in a "cove" in the high hills and cliffs that frown down upon the river for miles above and below the hamlet. On the opposite side of the river the land lies low and level for several miles back to the eastern bluffs. Over there is where the quail live; all through the early summer hundreds of them whistle "Bob White," while as many modest brown-backed hens are sitting on nests full of eggs, and all through July and August there are thousands of "cheepers" in the grass and weeds, darting everywhere in chase of insects, while they are carefully and proudly watched over by Mr. and Mrs. Robert White. In September the sportsman can walk through the stubble fields and find numerous "roosts," but seldom any birds, for now they lie too close and the cover is too rank; but from the evidences to be seen the old sportsman knows that in the glorious Indian summer days of late October his dog will find a plenty of them, grown into lusty fatness on the abundant feed.

Muddy Creek winds its sluggish way through this region, and if the gunner is minded to have some of the ducks that are to be found in it he can get a few, but not many, by walking along the banks. Is he tired of quail and quail shooting? Then let him on a fine frosty morning that promises a hazy day, with no wind, start leisurely up the narrow valley at whose mouth the hamlet stands, and keep an eye open for gray squirrels, for there are lots of them in these wooded hills. There

are turkeys in there too, so take a few turkey loads along, but do not waste time hunting for them. They are too wary and too scarce to make it worth while, yet you may run across them, so be prepared. When, after a half-hour's walk, the tops of the ridges are reached, don't tire yourself by traveling across them, but walk leisurely as you like along the crest of one till you come to where it ends in a cliff 200ft. high, with the Mississippi laving its foot. Sit down and enjoy the glorious view of the twenty miles of river that are in sight; take in at one sweep of the eye a hundred thousand acres of land on the opposite side of the river; level as a floor, and wonderfully productive. Over there by those three big cottonwood trees is where you and your friend had three coveys of quail scattered in the weeds yesterday, and got nineteen, and would have got more only the shells gave out. Half a mile to the right is the spot where the old dog got lost in the big weeds, and you found him pointing the biggest covey of quail you ever saw. Walk back along the ridge you are on till you reach the head of the "draw" that separates it from the next ridge, and if you have not got enough squirrels travel out this ridge as you did the other one. There are quail here too, but don't bother with them, for they fly across the ridges and drop out of sight, and it would tire the strongest legs very soon to follow them.

Some other morning take the fishing tackle, a supply of crawfish and minnows, for bass and crappie, and have your boatman row you up the river two miles to the mouth of Apple Creek. Take the gun along, but be sure you don't let the dog go, because "Yo' sho hab bad luck ef yo' takes a dog w'en yo' goes fishin'!" The creek is noted for its fine bass and crappie, though I have never fished there and cannot guarantee the fishing, but the creek is well worth a visit from a scenic point of view, and there is a tract of level woods hemmed in by the hills, which is a famous place for squirrels, and it is bordered by the creek.

If you get tired of camp life go across the river and hunt quail to Wolf Lake Station, some two and a half miles; and then take the train to Grand Tower, seven miles or so up the river, and feast yourself at the Tremont Hotel, where good Mrs. Baronowsky will make you very comfortable for $1.25 a day.

A more restful region than this would be hard to find. For many years the people had no intercourse with the rest of the world except by the river steamers, and they have unconsciously adopted the "plenty of time" ways of the boats. No need to hurry to-day, because there will be a to-morrow just like to-day.

The observant student of human nature can get considerable interest and some hints too about enjoying life by studying these people, who he will find stand out in sharp contrast to the heartless dollar chasers whose lives are spent in the rush and roar of the large cities.

Grand Tower, Ill., and Neely's Landing, Mo., can be reached by steamer from St. Louis. Boats leave St. Louis at 5 P. M.; arrive at Grand Tower about 8 next morning; Neely's an hour later. Fare $2, including supper, berth and breakfast. Grand Tower can be reached by rail, and Neely's by boat from there. If quail be the only object of the trip there is no need to go further than Grand Tower, but if fine scenery and a variety of sport are wanted, go to Neely's. There is no hotel at Neely's, and it might be necessary to take a camping outfit. Henry Rhodes, of Grand Tower, can give any needed information. If not otherwise employed he would be willing to serve a party of sportsmen in any capacity for a reasonable consideration. He is all right.

O. H. Hampton.

Reminiscences of an Old Sportsman.—XVIII.

It was the second year of my acquaintance with Andover that I extended my rambles into Marlboro, which lies next south of Andover. It was rather late in the season for woodcock, and we were searching for grouse. Finding some good looking country along a small stream, we took a turn of a couple of miles down upon one side of the stream and back upon the other, finding plenty of birds and fairly good covers. We also found a goodly number of covers that had every appearance of being capital grounds for woodcock in proper season, and we decided to investigate them the next year, but somehow it did not come handy, and I never saw those covers again until more than thirty years later, when, as the guest of my friend, Dr. Corcoran, who was a member of the club that leased the grounds, I again saw a portion of them. This was only a few years ago, and of course I did not expect to find anything like the number of birds that were there "before the war." We had a very pleasant time, however, although we did not get many birds, but the Doctor and I always do have a pleasant time when we go out together, birds or no birds. When we had packed up and were ready to start for home, the keeper remembered that he had three partridges that belonged to us, and he sent some one into the house to bring them out, and I put them in my overcoat pocket. When we arrived home I took the birds from my pocket, when the appearance of one of them led me to examine them all, when I found, greatly to my surprise, that somehow things had got mixed, for every one of those birds had been snared, there was the fatal purple ring around their necks, and not the sign of a shot mark upon one of them. If this was a joke, I do not think that the Doctor enjoyed it nearly so much as I did, for I have managed to get considerable fun out of it, but I could never understand how it was that such a thing could happen upon the premises of so well conducted a sportsmen's club as this appeared to be.

East of Marlboro lies the little town of Hebron, famous in the good old days for its grouse shooting, but the cream of this sport in this vicinity was to be found in the adjoining town of Columbia. Many of the covers were dense, but the partridges were there in countless numbers. I first saw the country upon my way home from a visit to Andover, when we sampled a few of the covers, finding birds so plentiful that we determined to take early opportunity to explore the region more thoroughly than we then had time to do. A few days later I was out shooting with Ethan Allin, and invited him to go with me to Columbia and try for the grouse. I had often tried to get him to go with me upon some of my long trips, but his time was usually fully taken up by his many friends, and he had been unable to go, but when I told him where I was going he at once agreed to accompany me, saying that he had once shot over a portion of this country, and had often wished to try it again. At the appointed time Ethan drove to my home for me, and we were soon on the road. I had my pointer bitch Gipsey, and Ethan had Tip and Packer's Phil. I had heard considerable about the hunting qualities of Phil, but had never seen him at work. He was almost as large as a Newfoundland and about as unsetterlike in appearance, but he was a great dog nevertheless, as I found out before our trip was over. His forte was quail, and among them he was a workman from start to finish, finding his bevies in capital style, and picking up his scattered birds in a manner that I have not often seen equaled. He was also very good on woodcock, and could do fairly good work on grouse. Old Tip was good all around, while little Gipsey could do very satisfactory work on quail and woodcock, and was about as good as the best on grouse. This made a capital team, and it was lively work at times to keep track of them, for all were fast and wide rangers, and much of the cover was rather dense, but all of them worked nicely to the gun, and when we lost one, the others or at least one of them was near enough to help find the missing one. We shot two days, and until 1 o'clock the third day. Here is the leaf from my notebook that chronicles our performances. "Oct. 21, Columbia—Ethan, Tip, Phil and Gipsey; 3 days; 43 P., 22 W., 59 Q. W. circled around Ethan, P. blundered into birch, 43 years old to-day. Phil finds yellow jackets, broke down, Howards Valley, home 2 A. M."

What a flood of pleasant recollections crowd upon me as I gaze upon these few disjointed notes. I am again a boy, my dear old friend is by my side, and I can again hear his merry jest and see his pleasant smile. The lithe forms of the well-remembered dogs are gallantly bounding through the dense covert, and as each agile form suddenly becomes rigid I again see the startled bird in its arrowy flight through the tangled tree tops deftly brought back to earth again, and once more I am filled with the delight that only comes to him who rounds out the perfect work of his dog with faultless performance of the part assigned to him.

We arrived at Columbia shortly after sunset, stopping with a farmer whose acquaintance I had made upon my previous visit. We took an early start in the morning, and were walking along the road toward the cover we intended working, and had reached the summit of a steep hill, when we saw, sitting on the bank beside the road, a small hatchet-faced man holding fast with both hands a two-gallon jug that was about half full of cider. We did not see him until we were within 10ft. of him, when he rolled his eyes toward us, pulled the jug closer to him, and sententiously remarked: "I'm forty-three years old to-day." There was a mellow cadence to the tone in which this was uttered, that led us to believe that he had begun the celebration of his natal day bright and early, and kept it up bravely. We both heartily congratulated him, and wished him many happy returns, when with a spasmodic jerk he pushed the jug toward us, and very cordially invited us to participate in the celebration.

Ethan took a drink, pronounced it good, and passed the jug to me. Now I am rather partial to good cider, so I changed my mind and concluded to please the man, and put the jug to my mouth, but it was no go, the cider I judged to be as old as its owner, and the very best that I could do was to make believe drink and then smack my lips. How the little man, in the condition he was in, managed to take a drink, has always been a deep mystery to us, but he took one nevertheless, and a good one too; then fondly hugging the jug in both arms, he slowly and with preternatural distinctness ejaculated, "I'm forty-three years old to-day." Nodding his head in adieu, he turned, and with a firm and even tread walked down the hill, but the effort was too severe for his overtaxed frame, he took about a dozen steps, then swerving a little to one side, he sank upon one knee, gently laid the jug upon its side and then completed his fall by flopping over on his back and rolling into the gutter, where he lay perfectly quiet for about three seconds, when he raised his head and saw that blessed jug slowly but surely rolling down the hill. The horror of this performance appeared to sober him in an instant, for he sprang to his feet as quickly as a cat, and, straight as an arrow, with the stride of an athlete, sped down the hill after the faster and faster revolving jug. But the race is not always to the swift, and he had gone but a short distance when he took a header that made everything jingle. This completely knocked him out. The genii of the jug had worked its spell, and he was bound in chains that held him fast. When Ethan and I recovered our normal condition, we placed the little man in a reclining position on the bank, with the jug, unharmed, beside him and resumed our course toward the cover.

The little cover upon the hillside that we first entered was the connecting link between a large tract of woodland that covered the top of the hill and a beautiful alder run that led in a zigzag way down to an extensive birch cover nearly half a mile below. We found a goodly number of birds on the hillside and in the alder run, and gathered in our share of them without noteworthy incident until we arrived nearly at the lower end of the run, when Gipsey pointed at the edge of the cover near me, and I signalled the point to Ethan, who was on the opposite side of the run. He at once answered my signal, when I flushed the grouse, which flew directly toward him, so that I dared not shoot. When I called "mark" another bird rose wild and went in nearly the same direction, which brought it about 20yds. in front of Ethan. I could see both birds after they topped the alders, but he only saw the second bird, which he killed. At the report of the gun the first bird, which was nearly over his head, dodged and blundered into the top of a birch, and came down at his feet, or rather into the open mouth of old Tip, who held it, and Ethan took it and wrung its neck, supposing that I had wounded it, and I had hard work to convince him of the true state of the case. In fact, he would not believe it until I showed him that my gun was loaded, when he had to, for I had not had time to load it. Ethan was nearly always suspicious that a joke was about to be sprung on him when anything out of the ordinary course occurred, and he had need to have his weather eye open, for he was an inveterate practical joker, and nothing pleased him better than to spring a joke on his friends, and as many of these friends were jolly good fellows, and up to snuff, Ethan usually purchased about as much wit as he succeeded in disposing of. I once met him and his friend, Judge Greene, of Worcester, near a spring, where we were all going to eat our lunch. When we came to the spring the judge sat down with his back to a large tree, against which we all stood our guns. While our lunch was in progress, Ethan kept nagging the judge about something that I did not understand; finally, while Ethan was looking the other way, I saw the judge furtively glance at him, and then, greatly to my surprise, he removed the percussion cap from the right hand barrel of Ethan's gun, then turning to me he explained that Ethan was finding fault with him for missing a woodcock that went straight in the air to the top of a birch, and then settled almost straight down 2 or 3ft. He then told Ethan that the shot was a very difficult one, and taking in his hand the tin can that hung on a branch over the spring, he pointed to the two pieces of cake that were to wind up their lunch, and offered to wager his piece against the other Allin could not hit the can thrown 20ft. straight in the air. This was a soft snap for Ethan, and he at once accepted the bet and reached for his gun. The judge tossed the can as soon as the gun was in his hand and Ethan hastily pulled back the hammer and snapped at just the right time, then, with a sheepish look, he glanced at his friend, who, as sober as a judge, sat there with a piece of cake in each hand, from which he was alternately taking a bite. After I had become a little accustomed to this the judge explained matters by informing me that Ethan had once placed him outside a thicket where the dog was pointing, and gone in to flush the bird for him, but instead of a bird the dog was pointing a box turtle which Ethan threw in the air and excitedly shouted "mark, mark," when the judge cut loose at it. Then he slyly added that this might have been pie for Ethan, but for his part he preferred cake.

Shadow.

[TO BE CONTINUED.]

CHICAGO AND THE WEST.

Opening Day.

Chicago, Ill., Sept. 1.—This is opening day. Thousands of guns will to-day be taken afield in different parts of the country. It is not opening day for Illinois, for our chicken date is two weeks later, but in Minnesota, South Dakota and Wisconsin Sept. 1 is acknowledged as the beginning of the fall season. In North Dakota they begin shooting grouse Aug. 20, though just why that State should open its season more than a week earlier than South Dakota is one of the mysteries of game laws. For a long time I was of the belief that Sept. 15 was the right date for chickens in Illinois, and I still think it is early enough for proper sport. But the great quantity of human nature must be considered while we are making game laws. Also, the laws of other States should be considered. I should be very glad to see the chicken law of Illinois amended to read Sept. 1, provided that we might have a close season of a couple of years on chickens, then a season opening Sept. 1 and lasting till Oct. 1. With these restrictions I believe we should keep our birds for a long while yet. The usefulness of concurring game dates among these grouped States of the Northwest is too apparent to need further comment in these days.

I note that the opening date of the District of Columbia is Sept. 1, and folks back there are making a big fuss about what they are going to do to the ortolans, reed birds, and yellowlegs. I see the statement gravely made that there is no law on blackbirds in that country, so that sport is not denied to the sportsman who wishes to go afield, though a few ardent ones have lately been fined for shooting reed birds ahead of season, it appearing that the sooner does not despise even so small a mark as that for his operations. Out in the West we still have some game bigger than reed birds, though we may well hope that some of our early shooters will take a backward look at a civilization which has to protect reed birds and takes blackbirds into account in its shooting possibilities. If our methods of soonerism continue in the West, some of us may live to see the time when we will protect larks and blackbirds, and do it a lot more thoroughly than we did our prairie chickens.

We have still some prairie chickens, and quite a good many of them this year in the Northwest. I was out in Minnesota last week, and though I did not get to stay over for the opening day, I had accurate and reliable reports which make me believe that this is really a good chicken year in that State, and in the Dakotas also. This season the chicken belt is especially good below St. Paul, between there and the southern line of the State, anywhere from sixty miles south of St. Paul and Minneapolis to the State line. Albert Lea, or rather the country fifteen to twenty miles west of Albert Lea, is very good this year, and I heard of two or three parties going in there for to-day's shooting. Dodge Center, farther south, is reported good. Many points in southern Minnesota will show a fair harvest this week. Donnelly is said to be good. Sauk Center is another place well mentioned, and at Alexandria there will be some birds. Pipestone is reported excellent, and Mountain Lake is another good tip. Tracy is an old reliable and will this year make good its reputation, I am told.

In North Dakota, Pembina is still called good, even after the fatal first week. Points thirty miles southwest of Fargo are said to be good still. Medina, N. D., is a spot on which I was given a quiet tip. All along

the central part of the State, back from the railroads, there are birds, though one should not look for them near any railroad town, where the shooters have been out after them for years, in season and out, with good guns and good dogs. J. J. Gokey writes me again from Dawson, N. D., that the season has begun, and that the birds are very abundant. "Hunters are coming in every night with good bags of chickens," he says, "and all report all the shooting they want. Among these parties stopping here are Messrs. Jos. Patterson, Philadelphia, Pa.; W. P. Tuttle and son William, Chicago; J. S. Marson and son, of Chicago."

In South Dakota the season has not been opened, but the early shooting has this year been very general for many weeks, in open defiance of the law. I am told that Parker, S. D., is a good place to go to, and that one may be sure of getting some sport there.

Michigan is yet another State which opens the fall campaign on Sept. 1, and to-day a great many shooters will go afield, but not for grouse or prairie chickens, or for woodcock and snipe, on all of which birds the shooter must wait till Oct. 1. The local ducks will therefore be the main sufferers to-day and during this month. A party of seventeen members of the Pottawottamie Club, of Grand Rapids, Mich., will go down to their club preserve to-day, and formally and suitably open their shooting season. This nice little shooting ground is located on the marshes of the Kalamazoo, and on many days the shooting there is good enough to make one content to stay home and not go to Dakota.

Travelers.

Mr. W. B. Mershon, of Saginaw, Mich., was in the city this week for a day. He tells me that he and the "Saginaw crowd" will take the regulation Western trip this fall in October, as usual. The party will be as big and jolly as ever, and it will have much the same programme—a week or so in the Bad Lands of Montana, after deer (and this time after bears too, Mr. Mershon says), then a return to Gokey's great game country at Dawson, North Dakota, where the outfit will shoot all the ducks and geese they want before turning eastward. This is a trip such as does not come to many men. The Saginaw crowd is one of the special car parties which is welcomed wherever it goes, and which never leaves a bad impression behind.

A very nice little trip is that proposed by Harry Goodman, of this city, who, with his friends, Theodore Peterson, Geo. and Robert Sanders, will take a team and start for an overland trip across Wisconsin and into Minnesota, traveling leisurely, and shooting at such good country as they may discover. They expect to start about Sept. 15, and to be gone until cold weather drives them home again.

Mr. Geo. H. Stuart, 3d., of Philadelphia, Pa., writes me a letter similar to others which I have answered personally. He wants chicken country, and says:

"I have been reading your letter on the 'chicken' crop, published in last week's FOREST AND STREAM, and being very anxious to get a few days' shooting, I take this liberty of asking for some information.

"A friend of mine in St. Paul writes me that unless I am there at the opening of the season it is almost useless to hunt chickens. He says he only knows the country over toward the South Dakota line. I will be unable to reach Minnesota before the 20th of September, and I wanted to ask if you knew any spot in northern Minnesota where I could find some birds not too wild to hunt. I am especially anxious to get two or three sharptail grouse at the same time. Are there not some places in the direction of Fargo, N. D., at least on the way, where the birds are less wild and are not hunted to death. I will be greatly indebted to you if you can give me some light on this subject, and also if you can give me the name and address of a reliable man."

When Mr. Stuart gets out into Minnesota he will discover two things which will impress him very much. First, he will find a very large country, and second, he will find it very full of shooters. If he should go to Fargo, he would not find the chickens there any tamer than they are in the southern part of Minnesota, indeed they will have been shot for more than a week longer than in Minnesota. It is no use trying to get so far north as to find a place where the chickens will, on Sept. 20, not have been shot into and broken up—that is to say, it would be hard to find any such place near the railroads. If Mr. Stuart got as far north as Pembina, for instance, far above Fargo, he would observe that the local sportsmen have had a very keen scent for the best fields, and have shot there and shot very accurately. Yet in lower Minnesota, in the country not far from Fargo, and in the region adjacent to Pembina, he will find enough birds still left on the stubbles to give him sport, and these birds will be flyers too, and will tax his skill rather more than they would do at this date. I should not take it to be true that every last living chicken will be killed in Minnesota on opening day, though no doubt the chances for a big bag would be better then than two weeks later.

If Mr. Stuart will go to Pembina, I think perhaps Ned Cavalier would be good enough to direct him how and where to go, and could get him his coveted chance to stop a sharptailed grouse—which the stranger will hardly be able to tell from the pinnated grouse until he gets it in his hand, though he soon will learn to see the difference when the bird rises. At Fargo also (though Fargo is a big and busy Western wheat town) the traveler can get out about a dozen miles or two, and can find a few of the sharpies on the wheat stubbles and about the cornfields. He will find plenty of these birds in the sand hills southwest of Fargo. At this point, or at Pembina, he will have to take out a $25 license. All things being considered, if I were an Eastern man and wanted a good Western trip, which would do for me to remember many years, I believe I should just take out my little license and go out to Dawson, N. D. J. J. Gokey, of that city, I know to be all right, and I would prefer to direct a man to a place which I knew about personally than to send him to some good hearsay locality. I never saw anyone who came back from that part of North Dakota without being satisfied with the sport he had. It is not the only place, but it is the best I personally know of out there. The State warden, Geo. Bowers, who has been reappointed for a second term, is a friend of mine, a good fellow, and a good shooter. I am sure he will do all he can to help Mr. Stuart to a good place, if he can tell of any better than Dawson. Of course, one must expect to ride out perhaps twenty miles from the railroads, but that doesn't take long in that country, where the roads and the air are a revelation to an Eastern man. The trip out to the great prairies is pay enough in itself, and I think we may safely promise Mr. Stuart his sharptail, and several of him.

Sooners Here and There.

Public sentiment out at Yankton, S. D., is very frank and outspoken in regard to the observation of the chicken law. The following naïve statement from the Gazette, of Yankton, may give a notion of things in that neck of woods. It is dated Aug. 26, several days before open season, and states:

"The chicken harvest is in full blast these days. To be sure none of the hunters are anxious to have it published that they have been out, owing to the fact that there is at least a pretense of a law which prohibits killing the birds at this time of the year. This does not prevent the sport, however, and large bags are brought in every night. One man captured fourteen fine birds yesterday and he says it has been a good many years since the crop was so good or so ripe for the harvest at this time of the year."

The same paper states calmly:

"D. D. Gross and Chas. Edmunds are back from their hunting trip with H. E. Dickenson in Clark county. They report the chicken crop in that part of the country as very plentiful, and shooting good, but extreme heat spoiled all their game."

They ought to see that newspaper man, and tell him not to talk out in meeting that way.

Out in Nebraska is another newspaper man with whom I think a great many men would be glad to shake hands. He lives at Hastings and in his paper he says:

"Sportsmen are not as plentiful in the sand hills these days as they used to be. This is caused by the scarcity of chickens, and the scarcity of chickens is caused by potshot hunters killing them off before they can fly. A true sportsman is a gentleman, a potshot hunter is a coward."

That is the good side of local journalism. Here is the other end of the pendulum, from Sauk Rapids, Minn., a locality which has always been a good one for chickens. The Sentinel, of that town, has a kick:

"Common and well-substantiated talk on the streets of St. Cloud and Sauk Rapids," it says, "justify these remarks or we would not make them. Every day much chicken shooting is done all over Benton county and the north portion of Sherburne county without hindrance. At least one person who has previously been in the hands of the game commission for a very large violation of the law, and was able to compromise it privately, has now been shooting chickens steadily for more than a month past, as if his private compromise insured him immunity for the future. It is not extravagant to say that the administration of the game laws this season, in this vicinity, is a farce and a fraud.

"We do not advise every farmer in the country, with all his boys and hired men, to turn in at once and get as many of the chickens they have raised as possible without regard to the law, but we do not advise to the contrary—not at all."

The Sentinel writer does not think the city sportsman is a lovely being. Here is the way another paper—the News, of Aurora, Ill.—paints him:

"Farmers of Sugar Grove say they do not wish to be unreasonable, but when a valuable colt or a fat steer is killed or wounded by some irresponsible shooter with a bottle of whisky in each hip pocket and a gallon jug full of the same stuff under the seat in the buggy, all will admit that it is about time to call a halt. The farmers have decided to stop hunting on their premises at all hazard."

Inasmuch as our chicken law does not open for two weeks yet in Illinois, I am disposed to believe that the Sugar Grove farmers have seen a few sooners, and not sportsmen. Thus the sins of the former bring punishment on the latter. I personally know a great many shooters who do not quite fill the above description.

An honest note is this from the Independent, of Chippewa Falls, Wis.:

"Sportsmen of this city are aroused to a pitch of just anger at the seeming indifference of the game wardens in respect to the violation of the law. That this vandalism should be now permitted has aroused true sportsmen to righteous indignation, and the attention of the State authorities has been called to the matter. The result is that a special State warden is now located here, and has been doing good work of late.

"If this practice continues much longer few game birds will be left by the time the open season arrives. Mallard, teal and wood ducks are now being killed by these unscrupulous pot-hunters and criminals, for no other purpose than an apparent desire to satisfy a fiendish delight to slaughter.

"It seems that the killing of game before the expiration of the law is going on to a greater extent this year than ever before."

Still another local paper has a good man running it, at Lancaster, Wis. (the Herald). He says that the quail are coming back into his part of the State, to the pleasure of many who knew them long ago, and adds:

"But with the return of the quail comes the report that they are being killed in several localities both by hunters and trappers, despite the law. This is too bad, for if the practice continues and becomes general the quail will go the way of the pigeon. Public opinion should assert itself to protect the quail. When a man or boy kills a string of quail, let him be convicted, if not in a court of justice, at least in the circle of his acquaintance of having done a shameful act and one which only future good conduct can atone for."

I was talking with President Timberlake, of the Minnesota Fish and Game Commission, out at St. Paul, this week, and he complained bitterly about the lack of public appreciation and understanding of the work of protection. "We want more public sentiment in our favor," was his cry. Yet he has more public sentiment in his favor in the State of Minnesota than the protectors of almost any Western State have behind them. I submit that the above reprints from local papers show a very good beginning of public sentiment in some of the cases, and a very bad sort of sentiment in some of the others. The newspapers help to create or to change a great deal of sentiment on such matters. The country paper is read by many dwellers in the country who give heed to its advice. I suggest to Mr. Timberlake, for instance, that he call on the Sauk Rapids Sentinel man and labor with him earnestly.

Four Burlington, Iowa, men came across the river and shot some nice fat Illinois birds in Lee county; $10 each and costs, but I can't get the names. The sportsmen about Elgin, Ill., have been out on the watch for sooners, and I don't doubt they landed a few last Sunday, as the scouts made a grand sooner hunt on that day.

Out in Minnesota they have a great scheme for casting down the spirits of the sooners. They seize not only their guns, but their dogs. I think I shall go out to Sam Fullerton's house before long, and pick me out a nice dog, as he has quite a lot of good ones now that he has confiscated. Around Crookston several dogs have been retained, it is said, and their sorrowing owners will see them no more. It costs something these days to get a good chicken dog, and it grinds a man a lot to see a fat and smug warden sail in and reap the fruits of many weary months of training. Some of the sooners say that they are almost persuaded it is wrong to go out before the law opens.

Wild Pigeons.

Mr. Taylor A. Snow, of Chicago, who used to live in Ohio in the old wild pigeon days, and saw the great flight before it was much decreased, has recently returned from a visit to certain rather wild and little frequented parts of old Mexico, and he says that he has undeniably found the wild pigeon in very large numbers in that country. He thinks there may possibly be a northern migration of these birds at some later day. At first hearing this discovery of the wild pigeon sounds very interesting, and it is perhaps true, though it occurs to me the discoverer may perhaps have mistaken the southwestern bird, the band-tailed pigeon, for the old passenger pigeon of our fathers' days. The two birds are very similar in general appearance, as I may personally testify from a shooting acquaintance with the band-tails in New Mexico several years ago. It would be great news should it prove the case that the wild pigeon is really still alive in something of the old numbers, though now in an alien land.

Odd Game.

A friend advises me that one day last week Mr. Dick Hoover, of Fox Lake, Wis., while out casting frog for bass had the singular fortune of getting a strike from a bittern, which was standing on the bank, and near which the frog landed. The bird caught the frog, and the angler struck and hooked the bird, landing it after a sharpish fight. The event is mentioned as a curious one, and so it is, though this is the second time I have heard of such a case. I earlier recorded the other instance in these columns of FOREST AND STREAM. It occurred on the Maksawba Club grounds along the Kankakee River, in Indiana.

Unconstitutional?

There is a good deal of complaint among shooters of a certain class at St. Louis that the law protecting wood ducks at this season is an unjust and hard-hearted affair, inasmuch as by Oct. 1 all these birds have taken flight and gone elsewhere, so that the shooters of the Missouri streams and slashes get no show at the birds which were born and reared these. It is more than hinted that the law is not thought worthy of observation, and is disregarded by many members of the shooting clubs who have grounds in duck country. The shooters think that when they go out after doves and woodcock in August they should also be permitted to shoot wood ducks, as that is the only chance they will get at these birds.

In this state of affairs we have nothing new and nothing noble, nothing newer or nobler than human nature, which is about four-thirds selfishness in a good many men and a good many so-called sportsmen. Any man who feels and acts that way is no lover of protection and no lover of any game bird. He doesn't want to have any protection or any law. He just wants to shoot whenever he feels like it. It is surrendering the whole question of the continuance of the American game supply when we hear men of presumed intelligence reiterate this old, senseless cry. If anybody is ever going to get a shot at this bird let me be first, at no matter what cost! Does it then follow that the bird one does not himself kill is at once thereafter killed by some one else? Is it impossible of supposition that this same bird may perhaps have a better chance for its life, so to speak, if it is not killed? Let the shooters of St. Louis, more especially of the shooting clubs which are supposed to hold only sportsmen, give this matter a little sober consideration. Is it too hard to ask them to weigh the simple proposition that a dead duck lays no eggs, whereas a live duck may possibly do so? This is the old question of Illinois and Wisconsin over again. Wisconsin says—and long said it on her statute books—"We shall not stop spring shooting until Illinois does!" That always seemed to me to be the most weak-kneed piece of legislative enactment on earth.

By the way, speaking of St. Louis, I observe a local report to the effect that "young owls" are now and for some time have been advertised on restaurant bills of fare in that city. Very likely the sooners of Illinois are shipping in an occasional "owl" to St. Louis.

Knapsacks and Packsacks.

I notice that a great deal of complaint is made of the U. S. army knapsack, the gist of which complaint is that the soldier cannot wear it, because it cuts off his breath, is clumsy, heavy and improbable. How would it do for the Government to have a look at the common pine woods packsack used all over Wisconsin and the Western pine regions? This bag does not cut off the

carrier's wind, and is easy on his back. The lumber cruiser carries 60 to 80lbs. on his back in one of these bags when he starts out on a trip. Not all soldiers could carry so much, for this is matter of long training in a country where men have to carry everything, but the arrangement of straps on this bag is very practical and easy.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

Covers near Town.

Editor Forest and Stream:

I stopped off at a little town not a hundred miles from New York, and interviewed, informally, two of the leading sportsmen in the vicinity. I asked them what the chances were for shooting in their vicinity when the open season comes around. They said that partridges were plenty, the mild winter having been especially favorable for their preservation. Quail were also more numerous than usual, and woodcock were plentiful, if one only knew where to hunt for them. After giving me in a general way the conditions of game, the chief spokesman said: "Don't say anything about it in FOREST AND STREAM, for if you do we shall be overrun with gunners from the city." This statement is a fair representation of the feeling toward gunners from the large towns. Local gunners are very jealous of the game in their vicinity, and are seldom disposed to share it with outsiders. In many towns, which have a reputation for gunning or fishing, there is considerable jealousy and more or less hard feeling between the hotel proprietors and the local sportsmen other than guides. The former would advertise the locality as the best place to gun, fish, etc., while the latter would keep the fact that game abounds as quiet as possible. It would seem as though the best method is to organize a shooting or fishing club, post all the land in the vicinity, or at least enough of it to keep strangers away, and then let the hotel-keeper grant licenses to his guests for a consideration, turning the money into the treasury of the club. Wherever such conditions exist, the farmers who own the land, the hotel proprietors and local members of the club are alike interested in preserving game and advertising the locality. The game is preserved, the hotels do a good business, and local sportsmen—who join the club—find that after the visiting sportsmen get all the game they want—or can get—there is more left than when the location of a flock of quail or feeding grounds of woodcock were secrets to be divulged only after the birds had been all bagged or scattered. Farmers as a rule prefer to have local sportsmen shoot the game on their premises, but have no objection to outsiders who recognize their rights.

G.

Trapping the Coon.

Editor Forest and Stream:

You have started "coon lore" by quoting from the Fur Trade Review. There is no telling when the discussion will die out. You may have to call a halt, but before that happens I wish to have my say.

Since I have lived on the Cape (fourteen years) I have trapped eleven coons. Six young coons were trapped in the fall, and five old ones, three in the spring, two in the fall, all of which were trapped in the woods.

Now here comes this Fur Trade Review fellow and says: "If any one ever told you he trapped a coon in the woods, he told you what never happened." This stuff is pure bosh. There is not a farmer boy in the New England States that cannot cite one case at least where a coon was trapped in the woods.

Off and on from boyhood up I have trapped coons. Trapped them in cornfields, in hen houses, in shoal water marshes, where they went to feel out frogs, and often in the woods by the carcass of a horse or sheep. I have had no more trouble in trapping coons than one would have in trapping woodchucks. The coons on Cape Ann live in ledges and under boulders. Ten of the coons caught since I have lived here were trapped at the hole. The trap was covered with dead leaves in each case. The other coon was caught in a trap set under a hemlock spray that drooped to the ground. The bait was suspended above the trap. In two cases the coon could escape without danger from the trap, for there happened to be two entrances to the den.

Your Fur Trade Review coon hunter says a coon will starve in his den if a trap is set at the entrance. I think he must have set his trap in the winter, while the coon was taking his winter nap.

To trap or poison the fox is another thing, and calls for much skill or ingenuity.

HERMIT.

Wyoming Game.

WILSON, Wyo., Aug. 18.—For the past two months much game has been killed in this part of the country—at least 100 antelopes, and how many elk and deer no one knows. The main antelope country lies along the west side of Snake River, below Jackson's Lake. Any one riding through this country could usually see 300 or 400 antelopes in one day's ride. I passed through that part of the country last week, and during the whole of my ride could see only thirty-one antelopes.

The cause of this is that there is no game warden to protect the game. There is one deputy State warden, but he refuses to act on account of receiving no salary. The county commissioners refuse to appoint wardens under a salary, as the law provides for. This is, I believe, the hardest blow that the big game of Jackson's Hole has been dealt. People coming to this country to hunt will soon hear of this, and will, of course, not take out any hunting license.

FRED E. WHITE.

A Moose Hunting Opportunity.

AN opportunity is offered for one to join in a trip to New Brunswick for moose hunting; and we shall be glad to put inquirers into communication with a New York gentleman personally known to the FOREST AND STREAM.

Newfoundland Notes.

THE claim of Newfoundland to the title of the "sportsman's paradise" would seem to be well founded, judging from the following clipping from the Herald, of St. Johns, of date Aug. 12:

"Judge Prowse has just returned from a successful fishing trip on the west coast, and reports that about Codroy is a veritable sportsman's paradise. Messrs. Ritchie, of London, and Howell, the great tobacco manufacturer, secured 750lbs. salmon and trout during their stay, some of the former tipping the scales at 17lbs. Sir W. V. Whiteway and party did some excellent fishing, taking a 35lb. salmon with an ordinary rod. It is Mr. Ritchie's intention to erect a building at the Codroy River for next season's sport, and we predict that hundreds will visit Newfoundland when it is known that no other country can give the same facilities for rod or gun as this can, while one can be dropped from the train within two minutes' walk of the best places in the island."

This island, heretofore considered almost inaccessible, is now fast becoming a favorite resort for American travelers and sportsmen. The scenery around Codroy and Bay of Islands, it is said, will compare favorably with that of any other part of America. There is tri-weekly connection with the continent, and the Trans-Insular Railway, running this season for the first time, is equipped with all modern luxuries. In consequence of some notes which appeared in FOREST AND STREAM some time ago from this island, your correspondent has had numerous inquiries from readers from all parts of the United States for information as to the means of getting here. For the benefit of sportsmen, I would simply repeat that there is tri-weekly connection by rail and by the palace steamer Bruce, and that through return tickets may be had of any of the large railway companies in New York for about $54. This includes passage in the Bruce, railway accommodation from New York to Sydney, and railway accommodation to any point in Newfoundland from Port au Basque, the port of connection.

W. S. C.

Death of Ernest Coulson.

TUPPER'S LAKE STATION, Aug. 30.—The first tragedy in the Adirondack region since the opening of the hunting season occurred at an early hour Sunday morning in the woods about four miles from this place, on the road to Saranac Inn. Ernest Coulson, one of the best Adirondack guides, was shot through the body, the shot entering the back under the right shoulder blade and passing through his heart, completely rupturing that organ. Coulson was with a fellow guide, Zeke Westcott, and had been out all night looking for deer. They had heard a rustle in the woods, and imagined it was a deer. Just then their attention was attracted by a sound further up the road. Before Westcott could discern the newcomers there was a crack of a rifle and Coulson fell among the bushes along the roadside, dead. Westcott said he was able to distinguish the shadowy forms of two men, who took to their heels and disappeared among the trees. Westcott shouldered the body of his fellow guide and friend and tramped to this place. A call was sent to Saranac for a coroner. Meanwhile the citizens are endeavoring to unravel the mystery and determine whether guide Coulson met with foul play or was killed accidentally by some one who was hunting for deer. Guide Coulson, as far as is known, had no enemy who could have desired his death. He had been guide for hundreds of the best sportsmen in the State, and his death will raise the question among hunters relative to the drafting of rules as to paths to be followed and precautions to be taken before discharging their arms.

Another tragedy occurred on Sunday at White Lake Corners, when Fred Picknall, who last year accidentally shot one of his sons, killed another, his youngest son, Philip. Picknall and his four sons had started out to hunt, and had separated to cover the ground more thoroughly. Picknall thought he saw a deer moving in a thicket, and raising his gun fired. Arriving at the spot he found his son Philip on the ground with a bullet wound in his head.

Early Birds at Currituck.

CURRITUCK, N. C., Aug. 27.—*Editor Forest and Stream:* Blue-wing teal, pintails and widgeon are arriving from the North. They are about fifteen days earlier this season than last; they went North much earlier last season than usual; I suppose this accounts for it. Messrs. Joseph Serlinger, Edward Myers, Joe Cockswain and son, all of Norfolk, were down for a try at the bay birds last week.

The yellowleg, willet and plover shooting is in its prime now, and some fine bags are made every day. Wild celery is so abundant in Currituck this season that it is next to impossible to navigate a boat through it; this should insure good duck shooting for the coming fall and winter. I am told that the old Currituck Club, kept by Mr. T. J. Poyner, and protected through the summer, has raised many broods of black ducks and mallards this season.

MORE ANON.

Heavy Guns and Light.

READING an article from the FOREST AND STREAM on light guns, I have thought to give something on medium and heavy guns. It is much easier to aim a gun in a horizontal position; but aiming at high angles, resting almost the entire weight on left arm or shoulder, I have found in rifle shooting that a heavy gun is more easily balanced than a light one, shooting at vertical angles straight up, or coming back to 45 degrees or more. The same principle applies to shotgun shooting. I have a gun weighing 7¼lbs., with a 24in. barrel, and find that this is too light weight for shooting at vertical angles, or when the wind is blowing. A shotgun should not weigh less than 8lbs., single or double. As a wing gun firing heavy charges, it is not so apt to be kicked out of range on the object fired at.

G. W. C.

Adirondack Deer.

AUSABLE FORKS, N. Y., Aug. 26.—*Editor Forest and Stream:* The law abolishing the hounding of deer is vindicating itself, so far as this section is concerned. Deer are more numerous than for many years past. Thus far but three deer have been placed on the market at this village, but presumably more have been served to "the friends" of the successful hunters.

CHENANGO.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Where to go.

ONE important, useful and considerable part of the FOREST AND STREAM'S service to the sportsmen's community is the information given inquirers for shooting and fishing resorts. We make it our business to know where to send the sportsman for large or small game, or in quest of his favorite fish, and this knowledge is freely imparted on request.

On the other hand, we are constantly seeking information of this character for the benefit of our patrons, and we invite sportsmen, hotel proprietors and others to communicate to us whatever may be of advantage to the sportsman tourist.

Bass Fishing on the Greenbrier.—II.

THE bass season, now at its height, is in some respects very good, though the waters have been so high that fishing has been greatly interfered with. It rained the first day of dog days and that settled it. The weather wiseacres had an old rule to come to time once and it is once more established and will last for years to come. Over 16in. of rainfall occurred in this section during the six weeks, and for two weeks not a hook did we cast in the river or creek. Finally the rain centered in one terrible day, when 4.2in. fell, and the river and creeks got up and flooded the town. Your humble servant was chased out of house and home at midnight to his ancestral hall, while the water came up and around his house, and we had the biggest flood since '77.

The waters went down and the weather has been dryer. The common belief is that the bass have been shuffled somewhat, and that when we go out to fish we meet with bass which were hitherto strangers to this part of the river. Knowing very few bass by sight, it is impossible for me to say. I half-way believe, however, that instead of coming out in the eddies or being carried down in a flood, bass go under the ledges and rocks generally, and stay in until the weather has cleared.

The beauty of the bass this year lies in his prime condition. He is full of fight and vigor, and is clear of parasites and good to eat. The waters have been flush the whole summer, and well aerated, and I am informed that the bass' condition depends upon the purity and temperature of the water it lives in.

The catches have not been large, but the good fisherman has hardly ever been wholly disappointed. The best catch I have heard of was a party of four catching 127 in one day with grasshoppers. This is a very unusual catch. One of our average bass makes a man a meal, so you see this party caught too many. I generally have enough of it when I get eight or ten.

I have caught several full-grown bass this year which would weigh a couple of pounds perhaps, and which refused to come out of the water until the matter had been fully argued.

If he will bear with me, I will recount a few of the instances which may give the reader as good an idea of the fishing on this river as is possible for him to get from me. This first real big bass I caught quite accidentally. Having started to visit a pool where there are some big shelving rocks "back of the meadows," one of the ubiquitous thunderstorms came up, and I crept into a pile of planks on the bank of the river. While there I put on a "king of the waters" (gray wings, red body), a favorite for this water, and waited for the rain to cease. Before the drops had fairly ceased to fall, I started out and walked across the mouth of a slough. The river came in against the mouth of this slough, forming a little pot of water, and having the fly in my hand, I cast it over this place, more to get the leader wet than for any real fishing intent. But the bass did not know that it was not intended for him, and he boiled up and took it, and my journey up the river was broken into. He took persuasion, and I was among the waterlilies, in the mud of the slough, but the bass made for open river. When he was finally reeled in, he took refuge in the waterlilies, entirely tuckered out, and he was picked up ingloriously.

On different days I landed three other big bass, two on a Montreal and one on a Furgerson, but there was no special incident connected with their deaths. They died game in a fair field of water.

But into each life some rain must fall, some days be dark and dreary. There was a "king of the waters" the store clerk had sold for five cents. He reckoned that was what it was worth. If I took the dozen, why it would be fifty cents. I took the dozen and left, and it is said that the Jewish gentleman who owned the store came in shortly and told the clerk that those flies retailed at twenty-five cents, and cost $1.70 per dozen wholesale, and the clerk had a bad quarter of an hour. That particular fly had taken just twenty-five bass by actual count, when a bass took it and 6in. of the leader at the mouth of Stony Creek. It was a sad time, for I was beginning to get anxious about fish, not having caught any. But how can a fly go better than to be thus taken when its work is done. That was the worst day I ever saw. Another fly was lost in the same way, and still another bass, the largest seen that afternoon, when just about ready to capitulate jumped out of the water and shook the hook from his mouth. "Oh, the dreary, dreary moorland! Oh, the barren, barren shore!"

Then again last Friday I went out, and the wind was

blowing like winter time—a wind too strong to cast a line, and making the line between the rings rattle against the rod. Then I put on a naked hook and captured a big green katydid. I let it float with the stream; and by and by got a vigorous pull. I struck, and out of the water leaped a big bass. I failed to remark that much larger per cent. of bass jump out of the water this year than usual, which goes to show they are in good condition. Nearly every one I have caught has leaped in reeling it in. I played this fish until I was reasonably sure of bringing it in, for after certain trials of strength having been unsuccessful, a bass rarely escapes. But a final struggle freed this bass, and the line slipped home. It was very distressing. I have a foolish habit of groaning when such a thing happens, and much to my disgust I found I had let out a groan that could have been heard 100yds.. The hook had broken right at the bend. People ought to be careful how they make hooks. I had a dozen, and I immediately threw them away. I put on a catfish hook and another bait, and got fast on the bottom of the river. It was enough to make some people swear. The wind finally died away, and I was able to get enough fish for breakfast by dark, with a fly.

And now I believe I am down to the gist of this tale and what caused me to sit down to write about it all while it was still fresh in my mind. I have just caught a most notable bass, and one that several fishermen have seen and lusted after. It was the big bass at the mouth of Knapp's Creek. Last Saturday I caught a medium sized bass out in the current, and several bass followed it out, and among them was a veritable monster of a small-mouth bass, that I put down as being 20in. long, water measure.

I could not get a rise from that bass, and as I had fished there all summer, knowing about it, it only caused me a momentary pang to see that magnificent fish unattached. Since then I had kept my eyes open for some nobler bait than I had been using. I wanted a mouse particularly. This morning, however, I got a linnet. And the way I got the bird was a little peculiar. We have had a telephone line recently built, and it is still a marvel to us. It has long distance 'phones connected with it, and the line is right heavily charged. Old Harry McDowell, an observant old darky, was coming to Marlinton, and he saw a little greenhorn of a linnet alight on the telephone wire, and somebody rang a bell and the poor little bird dropped down dead. Harry brought it into the post-office, and happening to be there, he gave it to me. I carried it to my office, took it home at noon, put it in the ice box, and about 4 o'clock I took it down to the mouth of the creek. There I fished with it for half an hour or so, and the bass left it strictly alone. I went to fishing with fly, and got two, and came back to the pool. The water was too flush still for good fly-fishing, and I caught a couple with grasshoppers and one with a toad. Then I was out of bait. I took out the little bird from my fish basket and put it on the hook, and sat down on a sandbank. I had no joy now in my bird bait. Just then a little toad hopped near me, and I turned to catch it. Directly I became aware that I had a tremendous bite. I struck and about 10ft. of line slipped through my fingers. I put on a little strain and the big bass shot up at least 3ft. above the water. I landed the fish after a few minutes' work, and it was undoubtedly the big bass, but the inches came off cent per cent when I came to measure it, but it measured a full 16in. to the fork of the tail. I was very well satisfied, having got the fish I fished for, something that is rarely accomplished.

ANDREW PRICE.

MARLINTON, W. Va.

Canadian Salmon Rivers.

NEW YORK, Aug. 30.—*Editor Forest and Stream:* I inclose you a copy of a letter of even date concerning the salmon question in yet another North Shore river (the Jupitagon), which shows pretty clearly the useless recklessness in view of the natural history of the fish with which the question is dealt with at that river. Stupidity could not go further than both to exhaust the fish to the indicated extent and also drive them away with offal.

CHAS. STEWART DAVISON.

Aug. 30.—Hon. E. E. Tache, Ass't Commissioner Lands, Forests and Fisheries, Quebec, Canada.—My dear Sir: I have to acknowledge the receipt of your letter of Aug. 24, No. 9957—98, and in accordance with your assurance that further particulars of the illegal taking of salmon in and the conditions of the various salmon rivers of the Province will be received with pleasure by your department, and be a material help toward prevention in the future, I venture to add to the particulars which I have already sent you concerning various rivers the following in relation to the Jupitagon:

Jupitagon (otherwise Tchiptagon).—This river, situated on the north shore of the St. Lawrence, about opposite the westerly end of Anticosti, is a short stream of perhaps ten or twelve miles, and then a succession of lakes (eight in number) back to the height of land. It was visited in the summer of 1898 by Dr. Alexander B. Johnson, of New York city, who writes me in relation thereto as follows:

"In the summer of 1898 I visited the Jupitagon. This small stream debouches at the northeasterly corner of a quadrilateral bay, at the entrance of which lie two rocky islands. The bay is about a quarter to a half mile in length and of equal width. The bay is nearly dry at low water, except for a shallow channel on the easterly side. This channel is perhaps 100ft. in width and less than 2ft. deep at low water. The actual entrance to the river is over some low falls by a passage less than 50ft. wide at the northeasterly angle of the bay.

"July 2.—At the embouchure two salmon nets were in operation, and so remained during my visit.

"The more westerly of the two nets was set at about 300ft. from the actual entrance to the river at an oblique angle to the shore from the sandy beach stretching toward the east. It was an extra long net, and contained two pockets, one at each face, so that from whichever side salmon might attempt to pass they would be taken. The easterly net was set from the rocks on the easterly side of the bay, directly across the channel, and at not over 150ft. from the actual river mouth. It naturally contained but one pocket (on its exterior face).

"There was less than 100ft. of distance between the ends of the two nets. These nets were not raised on either of the two Sundays during my stay on the river. They belonged to Charles Gerard, who resides at the mouth of the river. I am told that in 1897 thirteen barrels of salmon were taken in the nets, while in 1898 only eight barrels were taken.

"There were also two stage heads, where codfish were headed and gutted—one at either side of the mouth of the river. Some of the heads and entrails were allowed to fall into the water at the mouth of the river, though most of them were removed. (There is no doubt by the way that putrid animal matter in the water is a deterrent to the entrance of salmon into a river.)

"The more easterly stage head was about 300ft. from the actual mouth of the river, and was directly over (i. e., abutted upon) the narrow channel leading to the river (mentioned above), through which salmon attempting to enter must pass.

"The westerly stage head was actually at the mouth of the river, not over 100ft. from the first low falls referred to above. On ascending the river, I found on one bank at a distance of about a mile from the mouth at a pool (situated between the first and second falls) a stake driven into a cleft in the rock; opposite this stake, on the other side of the river, a large stone had been located. This stake and its corresponding stone bore evidence of having been used for the purpose of attaching the ends of a barrier net stretching across the pool, for which purpose the place was the most favorable in the whole river, as it is the main pool, and one where the fish remain at least several days before ascending the second falls.

"If this river is to continue to furnish salmon no nets should be allowed within the bay, nor between the islands, nor at the two headlands of the bay, for the configuration of the land and the location of the channel are such that even a small net will take almost all the fish either seeking to enter or following along the coast. There were during this season (1898) but a very small number of fish discoverable in the upper waters of the river, though the river was subjected by me to a careful daily inspection covering a period of a fortnight. Also a large proportion of what fish there were in the river bore net marks.

"The conditions at the river are such that it could be easily guarded by one diligent person."

I may add to the above that this river flows through the Mingan Seigniory (which I understand is now the property of or represented by the Labrador Company, of Montreal), and that it would appear not impossible that the Province should communicate with this corporation with a view to compelling its preventing the illegal netting and taking of salmon in this as well as in all other rivers under the jurisdiction of that company. I remain yours very respectfully,

CHAS. STEWART DAVISON.

QUEBEC, Aug. 24.—Chas. Stewart Davison, Esq.—Sir: I have the honor to acknowledge the receipt of your letter to Mr. L. Z. Joncas, our Superintendent of Fisheries and Game, dated the 16th of August instant, and containing very interesting information as to illegal salmon fishing in the Olomonashoboo and Washeecootar. Many thanks; and let me assure you any particulars you could furnish us with regarding illegal salmon fishing, either in the rivers or in their estuaries, will be always received with pleasure, as this would materially help us in preventing this illegal fishing.

I have the honor to be, sir, your obedient servant,

E. E. TACHE, Asst. Commissioner.

A Bass Pocket.

HUDSON, New York, Aug. 28.—*Editor Forest and Stream:* "Once a fisher always a liar" is an old proverb, and I think the readers of your paper will say this; but I am not a fisher.

On the morning of the 7th I concluded to take a ride, and having heard of a small lake ten miles from town thought to visit it, as it was the only one within the county that I had not seen. I put the dog in the wagon and drove up to John's. Now John and I are not only good friends, but there is something else; I can't tell you just what it is; but if I want to go fishing, hunting or tramping he is always ready. He owns a good dog, is a first-class fisher and a good all-round sportsman and companion. When I drove up he said,

"Where now, old man?"

"I don't know. Go and get Zoe and get in the wagon."

"Got any lunch?"

"No, but get in the wagon and ask no more questions."

We drove out about five miles, and as it was very warm I thought I had had about enough of the ride and told John so. He said, "All right; pull in here to Jake's." We drove in, unhitched the horse. John walked up to the house, and we were most heartily welcomed. The first thing the good housewife said, "Are you going to stay to dinner?"

"What are we here for?"

The family consists of Jake and his wift, their son Will and his wife, and contrary to the old saying that there isn't a house big enough for two women, they appear to drive well together.

Happening to look across the field I saw a very nice cover, and said to John, "Let us take Sneck and Zoe and walk over there."

We did not find anything in the cover, but we followed the brook down for half a mile until we came to a pond hole of about half an acre, and under the shade of some big willows sat down to rest. Three-quarters of this pond was full of weeds and covered over with what appeared to be floating grass. The only place that was free of grass and weeds was right in front of us; it was about 10ft. wide and ran the whole length of the pond. The water was about 2ft. deep, clear and cold. We had just sat down when I noticed two small sunfish in the water very near the bank, and about the same time noticed this floating grass moving up and down, and concluded it was a muskrat under the grass. I motioned the dogs to go in, and they swam through the grass and back, and just as they were about in the center I saw a number of fish come out in the open, ten of them in a school. I could not tell what kind they were; then out came some suckers, and by observing very closely I found this open place was alive with fish. John began to dance up and down, and said, "Do see them? Isn't he a lunker? But say, pard, what are they?"

I could not tell him. Oh for some tackle! But wait.

He went down in his inside pocket, pulled out a trolling spoon and 5ft. of line (not another inch). He cut a sprout from the willow 5ft. long, and with this tackle began trolling along the shore. When he had gotten about three rods from me I heard him say: "Come in here! Come in here!" and he pulled in a good-sized black bass. He threw in the spoon again and caught another, larger than the first. Then he caught a frog and put it on the hook, spoon and all, and as the frog struck the water I saw the fish leave the grass and strike. There was no reel, no split-bamboo, no chances to play him, but a steady pull of 10ft., line and willow. He got him to shore, reached down to pick him up, the hook broke and he was gone. I looked at my watch, and concluded it was time for us to start for the house. Just then Will put in an appearance and said, "What are you fellows fooling around this mud hole for?"

John said, "For bass."

"Did you say bass? Why, there isn't a bass within ten miles of here, and you might as well rake for oysters or clams as to expect to catch a bass here."

John showed him the fish, when he said, "Durn me if there is any one around here knows this. I would just as soon expect to catch shad running up that barb-wire fence as to look for bass here."

We went to the house and weighed the fish. The larger weighed 3lbs. and the smaller one 1lb., and we had hard work to convince the family that they were not fish that we had brought from town for them.

We sat down to dinner, and such a dinner! How we did enjoy it! After dinner we had a cigar and visited, and I lay down for a nap. Soon after John and Will were missing, and they didn't put in an appearance until 5 o'clock, when they came in with a package of tansy or some others herbs. When this was opened, out rolled two bass and two bullheads. The larger bass weighed 3lbs. and the smaller one 2lbs. They said that on their way down the creek they had caught three frogs, and Will had found three hooks at the house before they started. John put a frog on a very nice looking Aberdeen hook, and threw it in, and as soon as it struck the water he saw a big fish start for it and take it. He pulled him in, and had him within about 2ft. of the shore when he made one grand effort, straightened the hook out and went for the grass. He put on another hook, and with each of the other frogs he caught the other two bass, and with a frog leg he caught the two bullheads. The total weight of the four bass was 9lbs., and they were caught on a 5ft. line, on a 5ft. willow stick, in 2ft. of water, and less than 10ft. from shore. We talked it over, and not one of the family have ever known of this place being stocked, but here were bass, suckers, bullheads and sunfish. After a good bowl of bread and milk we started for home well pleased with the day and knowing that we had not only found a good place to fish for bass, but the most hospitable, kind-hearted, make-you-welcome family in the county.

H.

That Boy in the Adirondacks.

Editor Forest and Stream:

My boy friend in the Adirondacks has turned up again. He used to write a good deal oftener when he was at school "with nothing to do," but now he is in Northwood, and has guns and fish rods, pack baskets and bicycles to exercise, which just about keeps him entirely busy. Indirectly I have heard from him once or twice since he went down to see the war ships at Key West, but only in a vague though not indefinite sort of way.

"* * * He went fishing the other day and got some fish; enough for two meals." "* * * His boat upset and he had to swim ashore. He got the boat down at the island." "* * * He keeps teasing me to let him go camping alone. But I don't like to. It don't seem safe. He wants to go with Will Hamblin next week."

They went. That is sure. His letter of triumph says so, and some other things as well. The place they went to is the reservoir on Little Black Creek, nine miles from Northwood. Years ago lumbermen slashed over the woods there, took out all the spruce and hemlock and left a tangled mass of dead tops, which in a couple of years grew up to blackberry briers, and now is a healthy second growth, through which a man can force his way only with extreme difficulty. There are a few trails, old and new, leading to Black Creek Lake, to the North Branch Reservoir, to old skidways and a good one down the creek to the settlements.

There are three or four old lumber camps, rapidly going to decay. Their boards are now used to make little lean-to camps for hunters and fishermen, and of these there is a plenty.

The reservoir was a stillwater, winding through the woods and widening out into the great bed of quaking moss which floors a swamp whose recesses are deep and black. When the lumbermen were doing their worst they built a dam near the foot of the stillwater, of thick planking and hewed logs, and a mass of gravel heaped on either side to confine the water. The planking had a sluiceway, and water was turned loose in the spring to flood the logs a-roaring down the creek to the saw mills.

The dam has now been partially burned away. The alders that lined the stillwater are dead and gray, and rattle dryly when the wind blows hard. The trees in the swamp were half of them killed, and the moss is bottomed in soft black ooze with a skeleton of tree roots. Blue herons lift their grating voices here. The lizards wiggle about, and frogs whistle at night and grunt at dusk and dawn.

Game comes to this reservoir that thrills the hearts of boys to think about. Bears have lapped its water, and deer seek to avoid the flies in it. Last year one of the heaviest deer killed about Northwood mingled its blood with the brown swamp water. It attracted the boys because it is wild and lonely, and seems to hold up a prize of big game. Even a panther might be seen. The letter runs:

"You needn't be kicking so because I ain't writing no letters to you. You know what I'm up to when at home, and how paper sticks when a fellow tries to write in hot weather. Me and Will Hamblin went up to the reservoir Saturday and came back to-day. I rode up to his house on my bike and carried my pack, and then we hoofed it up past the Pardy Place and follered that old trail over the hill to Dennet's Camp, and we stopped at Michael's Camp, where Elmer made a little lean-to last spring when he went fishing. We had lots of fun, and things got awfully funny onct, and you'd orter have seen us.

"You know what a putterin' fellow Will is. Always wiggling and putting things that's crooked straight, and straight things crooked. He turned the camp out and fetched in some balsam boughs, and we fixed a bed soft enough to lie on, and made a fire, with a smudge to drive the skeeters away. He had to go get a big pile of wood, big enough to last a week. Then we went up to the reservoir to watch. I was up where the creek comes in, and he sat down by the dam.

"Six skeeters would climb down my back, and two would crawl up my trousers. Some would get up my sleeve, and mostly they'd get on my face, while punkies came in where they weren't. Will had all the tar, and so I couldn't do nothing but itch and swear. A mink came up the stream and ketched a trout 'bout 7in. long and ete it head first. Then he scratched his head with his left hind leg and chuckled himself under the chin and kinda curled his whiskers. Reg'lar dude, that beast. The skeeters didn't bite so hard when he was there. He went under a log, and I looked for something else.

"Rick, crick, swish, crash, rick, crash, rick, crash! Gee, I thought, 'Here comes one sure,' and I shivered and grabbed my rifle tight. 'Swish, swish, sh-h-h, crash —chureee, ree, ree, churra!' darned old red squirrel getting berries. And I waited some more. Then sun went down yeller behind the green trees; makes a fellow crawl when it's like that. And I could feel the woods getting darker and shadowy, and awfully still—just that creek sucking under a log, ugh!

"Will was going to holler when he got ready to go to camp. I felt the back of my neck begin to twitch, as if something were just going to grab it with claws. It got darker by jumps, with little shadders of light coming along once in a while, and a feller had to look twice to see once, and you couldn't tell if it was a black stump or a holler between the trees across the creek. And just then one of them great big long-legged, lean-necked, yeller-eyed, toe-in blue cranes came flapping out of the sky and lights sudden not thirty feet from me with a yell. Lordy! Lordy! I could only half see and only half understand. I riz right up stiff and aching, and then I sat right down again weak and limp as a dead wet rabbit.

"Will hollered in a minute after, and I was half-way to him in no time. We went down to camp and built a fire, and sat around and talked. He'd seen a pritty duck with a green head, and heard the crane holler. Sounded pritty loud where he was, and my shot too.

"I woke up once that night, and the moon was shining kinda faint, and there was an owl taking medicine and gagging after it outside somewheres. We was up at before daylight and ete a lunch, and went up to the reservoir for an hour or so, but didn't see nothing but a kingfisher. And I found the crane what had scared me where it had drifted against a bush. My bullet had soaked it through both wing bones. I wanted to eat him, but Will wouldn't.

"We went up behind the camp after we had breakfast and circled over the ridges up there; saw a lot of deer tracks and found a fresh bed, but didn't see anything. I saw a flock of partridges, and killed four with the target pistol before the ijits knew what was up. We had 'em for dinner that night, and burned the feathers and things in the fire.

"We hadn't seen anything, and didn't much expect to in the morning because we were going to start night after we got through watching the reservoir. We got to sleep pretty late that night, and slept pretty well till pretty near morning, and then Will got cold and got up to fix the fire. He'd just stirred the fire, so's the sparks flickered up, and something kinda big and kinda black circled round between him and me and went toward the woods grunting. He threw a hunk of wood at me, and I woke up, and we didn't sleep any more that night. When it came daylight we found that it was a bear, and his tracks was all round the camp. Gee! I wish I could have got my sight on him when he was between me and the fire. He didn't pass more than 6ft. from me when he went away.

"We went up and watched at the reservoir after we'd ete some partridge meat, and then started for home. We are going up again some day.

"Fred Jones and Will Miller are up in the woods on timber jobs, but they're going hunting later in the season of course. Fred says he reckons he'll fetch blood some of these days out of something, and if he don't he'll know the reason of it."

The rest of the letter is gossip about the boys—how Joe Curltail saw seven deer on his way to Finche's Camp with supplies; how several deer have loafed around Northwood all summer, and that the plentifulness of deer is due directly to the suppression of hounding.

RAYMOND S. SPEARS.

NEW YORK CITY.

Gogebic Bass.

GOGEBIC, Mich., Aug. 31.—Bass fishing is holding up, the daily catches showing no falling off in Gogebic's famous stock. Many anglers are here from all parts of the country.

K. B. W.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Some Preliminary Observations Concerning the Artificial Culture of the Grayling.

BY DR. JAMES A. HENSHALL, U. S. FISH COMMISSION.

Read before the American Fisheries Society, July 21, 1898.

THE grayling of Montana exists only in the tributaries of the Missouri River, above the falls, but principally in the three forks of that river—the Jefferson, Madison and Gallatin rivers and their tributaries.

In 1805 Lewis and Clark found the grayling near the headwaters of the Jefferson, and in the history of their wonderful expedition spoke of it as follows: "Toward evening we formed a drag of bushes, and in about two hours caught 528 good fish, most of them large trout. Among them we observed for the first time ten or twelve trout of a white or silvery color, except on the back and head, where they are of a bluish cast; in appearance and shape they resemble exactly the speckled trout, except that they are not so large, though the scales are much larger; the flavor is equally good."

This fish was not subsequently identified from this description, though any one acquainted with the locality and the fishes of the headwaters of the Jefferson could not doubt for a moment that the grayling was meant. Dr. Elliott Coues, in his edition of the "History of the Lewis and Clark Expedition," thinks the description applies to the bluebacked salmon (*O. nerka*) of the Pacific coast, though he says this genus is not known to exist in Atlantic waters.

In a recent communication to FOREST AND STREAM I have advised the adoption of the name *Thymallus lewisi* for the grayling on the strength of Lewis' description, and to relegate to synonomy Cuvier's name of *Thymallus ontariensis*, based on a specimen the locality of which is unknown, though it was wrongly attributed, as I believe, to Lake Ontario.

Seth Green and Fred Mather claim to have hatched the grayling artificially from eggs procured in Michigan in 1874. Seth Green has a brief notice in his "Fish Hatching and Fish Catching" of the hatching of about 100 eggs, but says nothing, except in a general way, of feeding and rearing the fry. I have an impression that Mr. Mather has reported his operations at greater length, but I do not remember just when and where his account was published.

The first real effort in this direction was inaugurated last spring by the U. S. Fish Commission, at a substation connected with the Bozeman, Mont., station, and situated on the inlet (Elk Creek) of Red Rock Lake, the headwaters of the Jefferson River. The auxiliary station was in charge of Mr. A. J. Sprague, who was detailed from the Leadville station, and worked under my direction.

Mr. Sprague took some 3,000,000 grayling eggs, 1,000,000 of which were hatched and planted in Elk Creek; 50,000 eyed eggs were shipped to the Manchester, Ia., station; 50,000 to the Leadville, Colo., station, and 10,000 to the U. S. Fish Commission exhibit at the Omaha exposition, all of which, by extra precautions in packing, arrived at their destination in good condition. About 1,500,000 were shipped to the Bozeman station, but many were lost owing to a lack of ice for packing the eyed eggs. Some green eggs were shipped as an experiment, and though seemingly in good condition on arrival at Bozeman they all died soon afterward.

These eggs were shipped over a wagon road some sixty miles in a common farm wagon, without springs, and called by courtesy "a stage," from Red Rock to Monida, Mont.; thence by railroad. The drive of sixty miles is made in one day by relays of horses, and as the drivers are required to "make time" the eggs were subjected to much jolting.

The problem of transportation of eyed grayling eggs, however, has been satisfactorily determined. As the period of incubation is so short, it is absolutely necessary that the temperature be kept between 40° and 45°. This can be accomplished by packing ice and dry moss beneath, around and on top of the stack of trays in the egg case. A good plan also is to place an extra ice hopper in an inverted position over the usual hopper; this answers the double purpose of keeping the moss dryer and also allows more ice to be used on top. It is of the utmost importance that the eggs should not be subjected to the least pressure during transportation. There should be very little, if any, moss placed over the eggs or between the egg trays. Any pressure on the eggs causes fungus to develop, and is fatal to the life of the embryo.

About 500,000 eggs were hatched at the Bozeman station, and at least 50 per cent. of the fry are alive, and most of them are feeding.

In stripping the female grayling the eggs are a little harder to start, but are then extruded more freely than in the case of the trout. About 3,000 eggs is the average for a fish of 12in. in length. The eggs are white and as clear as a crystal; they are smaller than the native trout (*S. mykiss*) eggs, but after impregnation and the absorption of water will average 1-7in. in diameter, while the native trout eggs are 1-6in., and the brook trout (*S. fontinalis*) eggs are 1-5in. in diameter.

Soon after fertilization the eggs become glutinous and adhesive, forming bunches or masses of various sizes, when fungus rapidly develops and kills the egg. This renders the work of picking laborious, but imperative. The embryo develops rapidly and is in constant motion, often causing the egg to roll over on the tray. The grayling eggs are lighter than trout eggs, almost semi-buoyant, and from our experience would be better hatched under a pressure of water from below. In an improvised jar they did well, and the bunching and development of fungus did not occur. Perhaps the method followed with pike-perch eggs in using starch or muck might cause the eggs to separate, and the bunching to be prevented. Next season I propose to experiment with fine quicksand, so called, which is abundant about Red Rock Lake; it is more like fine marl, as fine as wheat flour.

The embryo begins to show life and motion before the eye spots are visible. The eye spots are small gilt specks with a minute black pupil, and appear in from three to five days. The period of incubation is from ten to twelve days, at a temperature of about 50°. The fry are hatched with a very small yolk sac, about half the size of the egg, and which is absorbed in about a week, when the fry immediately becomes a free-swimming animal about ½in. in length, and is quite slender and delicate. They do not begin to feed so readily as trout, and require constant coaxing, as often as every half-hour, with liver as finely divided as possible, being in fact bloody water. The best method of feeding and rearing is yet to be determined. Those hatched and planted in Elk Creek did well, being double the size at the same age of those hatched at Bozeman station, which proves that we must follow as closely as possible the natural conditions of breeding.

The grayling does best in sandy and gravelly streams, with swift and pure water. It is a much superior fish for the table than any of the trouts, and in game qualities is their equal. As the species is rapidly disappearing, it seems to be important that so good and beautiful a fish should be preserved by artificial propagation, and no reasonable efforts should be spared to determine the conditions best suited to its successful culture.

Confession of a "Fish Hog."

A FARMER'S boy, who put a score of eggs under a hen, explained that he did so to see the old hen spread herself. Man is but a higher animal after all, and when fishing rudimentary bristles of the "fish hog" will sometimes make an effort to work through the skin on his spine.

I was fishing one day on Lake Ida, near Alexandria, Minn., a station on the Great Northern Railroad. I had repeatedly fished this lake, it being, in my opinion, the best lake in Minnesota for small-mouthed bass fishing. Large-mouthed bass abound everywhere in the lakes of this State, but the small-mouths are comparatively a rara avis.

On the day in question I had enjoyed moderate and satisfactory fishing, my live string at the side of the boat being sufficiently long to satisfy any reasonable angler with half a dozen expectant, fish-loving neighbors at home.

The day was almost drawing to a close, the sun gradually working its way toward the western horizon, when a gentle summer shower fell, lasting for half an hour. In clearing up the woods and fields presented a glowing, glistening picture as the setting sun turned every rain drop on grass and trees into glistening globules of reflected light.

I was wrapt up in the scenery of water, woods and fields, when my oarsman with an exclamation called my attention to the fins of numbers of large bass cutting the water around the boat as they moved lazily to and fro. They evidently came up simply to look at the sun and satisfy themselves that the rain had ceased for the day, as without warning the fins disappeared, the fish descending toward the bottom, about 10ft. down.

I make it a practice to take with me in the boat two completely rigged rods, one of which I carefully stow along the gunwale of the boat. While the large-mouthed bass in this lake abound, and are easily seduced by casting with a frog or minnow, my custom has been to still-fish with live bait for the small-mouthed fish who hug the sandy or rocky bottoms, and in my experience rarely, if ever, take a fly in these waters. On this trip my rig consisted of two 7oz. split bamboo trout rods, a small shot being used to sink my frog or minnow to the bottom.

In one of Black's novels, wherein fishing for salmon with two rods is vividly described, the guide holds one fish-laden rod until the angler has killed the fish in hand, and then hands the rod to the angler to kill the second fish. The opportunity was here to make a like experiment, and over the stern of the boat I quickly dropped my minnows.

Presto, the tip of one rod steadily bent until its point entered the water. A turn of the wrist and the rod straightens as the silvery small-mouth leaps into the air to return to the water and fight for his life. He has not made more than his second run before rod No. 2 dips its tip into the water. Cautiously directing my fish into a sidelong run, I stoop for the second rod, strike my fish, and hastily handing the rod back to the guide, instruct him to handle the fish lightly and gently, taking care to keep him out of my way as I resume the playing of my first fish, which I at once begin to do. It's a gamy fight, made up of quick rushes, soundings, long runs and sundry leaps in the air, but the hook is well set, and presently the fish, yielding to the bend of the rod, comes slowly toward the long-handled landing net, wielded by the watchful guide, who with his left hand offers me the second rod, which I take the very moment I feel the tension of the rod relieved by the landing net, after first drawing a yard or two of line off the reel, and resting the rod in position with the tip over the stern of the boat.

As I take the rod from the guide and stir up my fish with a little extra tension, the landed fish is unhooked, a fresh bait put upon the hook, and the same thrown into the water by the guide, to gently settle near the bottom. The bass in hand, true to his kind, plays a tune upon my reel and curves my rod in orthodox style, but before I have him half killed the idle rod shows signs of life, the tip slowly points toward the bottom until it disappears beneath the water, when, seizing a favorable moment, I stoop and strike and again quickly hand the rod back to the guide, whose outstretched hand is ready for it.

And so it goes for an hour or more, when the fish cease to strike as unanimously as when they commenced to bite.

While it lasted it was what might be termed by some great fishing, but to my idea such a solid day's fishing would be worse than breaking stones on the road, as far as hard work was concerned. There certainly would be no sport in such continuous angling, but for an experience simply I doubt not but most anglers would like it "just once." While it lasted it certainly was exciting, as the fish were of good size and fought well. The fishing was so uninterrupted that the guide had no opportunity to put the fish thus caught upon the live string, his hands being full all the time. An hour's such fishing is a solace to a man who re-

members it on the day when the bass "won't take nothin'." He thinks of that hour's fun and forgets that for the day he is having the poorest of luck. Of all the good catches taken in this best of lakes, I somehow or other look back to this hour's fun, when the sun was throwing its last disappearing rays over the surface of the lake, as being the liveliest of them all. It was unsportsmanlike, and no doubt savoring of the "fish hog," but the fish were there in a school, and the rods were there, and the temptation came upon me to imitate the farmer's boy and see myself emulating the egg-spreading hen.

We saved the small-mouthed bass and allowed those upon the live string, of the large-mouthed variety, their freedom. We took home a moderate catch of bass after all, enough for our own table and those of our immediate neighbors. Somehow or other, when on fishing bent, and when, after completing my preparations for an early morning start out of town, I have more than once after retiring dreamt of that hour's fishing, and have yelled out in my sleep, "Here, Charlie, take it! Keep him out of my way till I land this one. Gee, but he's a whopper," only to get a sharp and well directed elbow in my ribs, with the wifely injunction not to wake up the whole house, but to wait until I reached the lake, and then shout to my heart's content.

CHARLES CRISTADORO.

ST. PAUL, Minn.

Our Frogs.

BY FRED MATHER.

THE following request, on a postal card, is the occasion of this article: "Could you give us a chapter on frogs, the varieties, life history and a full description of the different kinds of frogs found in North America? I am sure the readers of FOREST AND STREAM would appreciate an article on this subject."

I consulted the editor—it's of no use to leave him out of the calculation—and he thought the subject might be interesting if written in a popular manner. By this I understand the "if" to mean that I might try to popularize the subject, and he glanced at the waste basket, which was large, but not quite full. I had just given him a dry lot of manuscripts on the differences of fishes and how to distinguish them, and went home with a mind filled with frogs, and attempts to pull together what I might know about them. Then followed a hard night. Great frogs sat on my chest and almost suffocated me, and then would leap from that anatomical protuberance into an enormous waste basket, only to be followed by another, bigger yet, and somehow that basket never became full. At breakfast it was suggested that I had been visited by "the nightmare and her nine fold," but I denied it and said: "There was merely a frog in my throat."

The morning mail brought a letter from the Adirondacks, written by a boy of fourteen who has fished with me for codfish in winter from the iron pier at Coney Island, and whom I have interested in observing all animal life. His father, with my consent, allowed him to call me "Uncle"; you know that a boy does not want to "Mister" those he fishes with, and so he writes:

"Dear Uncle Fred: I wish you were here with us. There was a deer that waded out in the lily-pads close to us yesterday, but you have seen deer enough. I want to say about the toads up here, I don't believe you have noticed them; they are all fancy colored, and not a bit like the mud-colored toads in Brooklyn. When I go back I will bring you some, and let you see for yourself, and then you can write up the handsome Adirondack toads in FOREST AND STREAM, which we have sent to us up here. JACK."

There seems to be no means of escape. The frogs and toads are closely related, and once a forgotten correspondent asked what was the difference between a frog and a toad, and if one was edible, why not both? I cannot answer this last question, because I do not know of any man who has eaten a toad.

Toads.

To begin with, the so-called "horned toad" of the far Southwest is not a toad, but a true lizard. All lizards love the sun, have scales of some sort, and never have naked skins, nor do they live in water or damp places, like the salamanders, newts, efts or evets.

"No, Jack," I wrote him, "you have not found a new species of toad, merely a local variation of color in the same old brown toad that you knew near Brooklyn. Bring some down and let them loose in your garden. This family of tailless batrachians has but one species in North America. Don't be afraid to handle them on account of that idle talk about warts. I've handled toads all my life, and never had a wart. I never see a toad but there is a desire to handle it, and they can be made very tame. Try to tame one by handling and feeding it flies. Note how its tongue is fast to the front of its lower jaw and is free behind, and how it can throw this glutinous tongue out and capture a fly or an ant so quickly that your eye can hardly follow the motion.

"In spring and early summer that long-drawn plaintive cry like 'qua-ah-ah' is the call of the toad from the ponds and marshes, where it breeds, and is made before it goes back to its favorite garden to assist the gardener to keep down insect life. Those stringy bits of jelly you see in the water are most likely the eggs of the toad, as the frog lays its eggs in large masses, yet you might mistake the eggs of the salamander for those of the toad. The small, very black tadpoles are likely to be young toads. Toads confined in mines and cellars have laid their eggs in damp earth instead of water, and they have hatched perfect toads, skipping the tadpole state. It is a fact that the skin of a toad exudes an acrid moisture which so burns the mouth of a dog that he soon learns to distinguish a toad from a frog, and seldom wants to sample a second toad.

"And now, Jack, go in for toads and all other life that comes your way, and you will find great pleasure in gaining knowledge at first hand, even if you are now disappointed at not having discovered a new species of toad. When you look at the eye of a toad you will see a most beautiful one, and will fully understand Shakespeare's reference to it in the lines:

"The toad, ugly and venomous,
Yet bears within its head a precious jewel."

"I am quoting from memory and will call attention to the fact that there are people living to-day who regard the toad with aversion, and believe that it spits venom. Don't believe a word of it, nor of the story that young toads rain down. They simply come out from their hiding places after a rain, that's all. Bring down some gaily-colored toads."

Tree Frogs.

These are usually called "toads," but are frogs. Their fingers and toes are tipped with disks, which exude a sticky substance that enables them to climb up glass. We have about half a dozen species in the Eastern United States. Some of these are the "peepers" whose mating call is heard in the swamps before spring has had time to do more than push out the catkins on the pussy-willows; and a drop of the thermometer to below 30 degrees silences them again for a while. Of these tree frogs there is one species known as the cricket frog, which is heard in the swamps from southern New York to Illinois, and is a poor climber. Jordan says: "Its note resembles the rattling of pebbles," but to me its rapid notes are a reminder of a boy with a stick in conjunction with a picket fence.

Next comes another swamp tree frog that really climbs trees, at times. Cope says: "Its voice is a rattle with a rising inflection at the end," and Jordan adds: "Or like the scraping of a coarse-toothed comb." It is an impossible thing to convey an idea of the sounds made by many of nature's vocalists. I may be deficient in imagination, but I never heard a crow say "caw," nor a quail whistle either "Bob White" or "more wet"; for the quail has three notes, the first very low. I never heard a duck say "quack" nor a plover say "kill deer." From the sounds made by the swamp tree frog I could, by night or day, close my eyes and imagine that a band of old-fashioned minstrels were performing in the distance and only the "bones" were audible; and for years the frog, which science calls by the clumsy name of *Chorophilus triseriatus*, I have known as "Billy Burch," and I'll leave it to Jack if that is not the best name of the two, for "Billy" shook the "osteological specimens" from boyhood until he died two years ago, aged seventy-two years.

I will now appeal to Jack, and to the gallery, for applause for refraining from dragging in descriptions of these little beasts, most of whom are much shorter than their names; for an illustration of this, see the above name of a frog which never, in its best feeding grounds, exceeds 1in. in length. Still it is a frog, and entitled to be known as one.

The most common of our tree frogs is seldom seen. Its loud, clear trill is heard in the woods morning and evening, and in damp weather, but the little fellow, measuring less than 2in., has a way of hugging a branch when alarmed, and looking like a bit of parti-colored moss or lichen. These pretty creatures have an elastic skin on the throat which they inflate to the size of a filbert, when they "peep" in the spring in the marshes or trill in the woods in summer, where they go after the mating season is over. In color they may be gray, brown or green; possibly they can adapt color to their surroundings. There are several species, but all can leap from limb to limb like squirrels.

Edible Frogs.

All frogs are edible if freshly caught. Perhaps the bullfrog will bear keeping alive for a while and still be good; I am not certain of this; but once, when I kept a lot of small, green frogs in confinement for two weeks, their yellow vests turned white; and when they were cooked there was a bitterness that is foreign to this or any other frog that I have eaten, and with the exception of the two species of little wood frogs I have eaten them all. These wood frogs are colored a light reddish-brown, and are too small and scarce to hunt or I would have sampled them. Besides these species we have five others, mostly small, but edible. Four species never exceed 3in. in length of body, while a bullfrog has been known to have a body 9in. long from tip of nose to where the tail would sprout, if there was one. It is a common error to consider all small frogs as immature bullfrogs. A bullfrog is one from the time it is hatched from the egg, and if fortunate grows to a size that no other species could attain if it should live for a century.

The Leopard Frog.

This is common, known to science as *Rana virescens*, bright green "with irregular black blotches edged with whitish, these mostly in two irregular rows on the back; usually two spots between the eyes; legs barred above; belly pale. Length, 2¾in.. N. Am. W. to Sierra Nevada, very common." This quoted description and all others not specially credited are from Jordan's "Manual of the Vertebrates."

The Pickerel Frog.

This, *R. palustris*, is, as its name indicates, a swamp frog. "Light brown, with two rows of large oblong square blotches of dark brown on back; one or two on sides; a brown spot above eye; a dark line from nostril to eye; upper jaw white spotted with black; head short, obtuse; toes well webbed. Length, 2¾in. E. U. S., in mountains, etc."

Just why this is called the "pickerel frog" is beyond my guessing ability, for if there is a species of frog which a pickerel will always refuse it is a frog which is not on my visiting list, and one whose acquaintance I will decline if an introduction is proposed.

There is a point which I should have mentioned. All frogs have their ear drums on the outside of their heads, not protected by a long interior canal, as are the same organs in mammals, and these circular disks are very conspicuous. The scientist notes the size of this drum, and finding it constant in species gives it a value. In the two preceding species the ear, or tympanum, is smaller than the eye.

The Northern Frog.

R. septentrionalis is another little fellow, about the size of the other two, and its ear drum is also comparatively small. "Brown or olive, with paler vermiculations; sometimes a few dark blotches behind; pale below, * * * Canada to Montana." This, to me, is not a common frog. I have picked it up often when frogging, and have marked it for identification after cooking and called it "as good as the rest."

The Green Frog.

In *R. clamata*—noisy—we find a slightly larger species than any that have been mentioned, growing to a body length of 3in. or over, with thighs in proportion. This frog, with the bullfrog, has its tympanum larger than its eye. It is "green or brownish, brighter in front; generally with irregular small, black spots; arms and legs blotched; toes well webbed; first finger not extending beyond second. * * * E. U. S., in springs, etc."

Dry Stuff.

I know this sort of stuff is very dry fodder, and I've shortened it up as much as it would bear, but when a fellow is asked to write up our frogs, he must tell how they differ. The information being divided under subheads, I feel that I have aided some readers in skipping the more dessicated portions and will try to interest them further on, if they like frogs.

Ye Bulle Frogge.

When Pat found a pond in his path and tried to wade it after listening to advice from the other side, and was nearly drowned in crossing, his remarks were, as recorded in the Talmud and the Rig Vedas: "Ye little spalpeens, ye omadouhns! I'd split yer heads wid my shillaly for sayin' its 'knee-deep, knee-deep,' and enticin' me to a drownin'! Yer grandfather, over beyant, tould me 'go 'roun', go 'roun',' an' next time I'll tak' the oul' man's advice."

Some years ago one of your always readable correspondents wrote up the old account of the migration of "The Frogs of Wyndham," which alarmed that part of New England so severely over a century ago that a poem was written on the subject in the Revolutionary days.

I have assumed that the "Frogs of Wyndham" were bullfrogs. The chances are that it was "fresh-water day" for a battalion of spade-foot frogs, a toads, for I am not sure where they belong. They are solitary, and burrow in the soil in the woods, having a spur on the heel for digging; but when they congregate in a pond their noise is terrific. Dr. Abbott says: "The machinery for producing sounds equal to a steam whistle is apparently confined to the throat of this rare and curious batrachian." I never heard them but once, in a pond near my house on Long Island, and people came for miles around with lanterns, thinking that murder on a large scale was being done.

The true bullfrog (*Rana catesbiana*), named after Mark Catesby, who first figured the animal, has enormous ear drums and a voice to correspond. It is the largest of all frogs, and varies in color from a brown to green of various shades, the head being usually bright pale green. Its food, like that of its relatives, consists of worms, snails, insects, small fishes, and even young turtles have been found in its stomach.

The common frog of Europe is a small one, about 3in. in length, and some of them once gave me a chance to observe the cannibal tendencies of our big frog. I was going to England, and by request of Prof. Baird took six of the biggest live bullfrogs that I could get, selected from several hundred at Mr. Blackford's, in Fulton Market, and they were enormous. They were for Mr. Moore, Curator of the Derby Museum, at Liverpool. How long the frogs had been without food when I delivered them to Mr. Moore is more than I can say, but they had had nothing while on the ship, and perhaps nothing for weeks before. Mr. Moore put them in his frog cage with a dozen of his natives. I warned him of the result, but he did not care; there were plenty more. The big Americans were dropped into the cage, looked around, and then each swallowed a "native," as Mr. Moore called them.

"How slick they went down," said he. "I expected some remark first, something like:

"'Fee, fi, fo, fum,
I smell the blood of an Englishman,'

from these giants. Look there! The last one's gone; they should have had two each, but I think one of your Yankees got three. They took them so rapidly that it was impossible to keep count." And the pleased curator rubbed his hands and remarked, "They've remarkable appetites; but I suppose a sea voyage has sharpened them up a bit. I'll get more frogs for them to-morrow, but if they're not to be had I'll try them on sparrows."

Mr. Moore wrote me afterward that "they took sparrows quite well." And so we see what appetites these fellows have.

Frog Culture is Impossible.

About once a year the story of a mythical frog farm, where much wealth is harvested every season, goes the rounds of the newspapers. Seth Green started it in an article on raising frogs, published in one of the Reports of the State Fish Commission, stating how easily the spawn could be gathered and hatched; but he went no further; he was widely quoted and that was the end of it, if not the object of his paper. He was right. They can be hatched in any quantity in pools of still water at summer temperatures, and the tadpoles can be fed and grown if protected until the transformation into a frog comes, and then they leave the water and catch insects; it is impossible then to feed them and they die. I speak from experience, having been a student of the frog during a long career of fishculture, covering thirty years. In the early days I read of a successful frog farm near Nutley, N. J., and went there, but no one knew of it, nor could I find the man. A similar experience in Indiana made me skeptical, but it was only personal study and experience that made me an unbeliever.

I can feed a single frog by dangling a bit of meat before its nose; the meat stirs and the frog seizes it, but it will not pick up that meat from the ground if thrown

there. Suppose you have a million frogs. Imagine yourself feeding them by dangling meat before each individual nose!

Tadpoles are hatched by the thousand for every frog that becomes adult. Fish, birds and frogs feed on them in the larva, or tadpole state, and when they emerge from that they encounter the same enemies, with snakes added.

The frog is a solitary animal, never in the company of another except in the spring of the year; and they cannot be kept in numbers, like fishes, because they would starve if obliged to compete for food with their fellows. The frog farm has not yet been established where they can be hatched and fed artificially until ready for market, and it never will be.

A Great Transformation.

The change from a tadpole to a perfect frog is as wonderful as the change from a hairy, crawling caterpiller into a beautiful butterfly; but somehow this wonderful transformation into a frog, while well known to a few, has not seemed to impress the general mind, as in the case of the butterfly. What happens is this: The frog lays its eggs, which are fertilized after being laid, as in the case of most fishes; the eggs are globular, jelly-like masses, which swell greatly after extrusion. In a few days the embryo is seen moving about, and it emerges from the mass without absorbing it, a most unusual waste in animal life. The young is coiled in the egg, with a tail, much like an embryo fish, but having its gills outside, and so hatches in an almost shapeless form. Gradually it takes on the form of the large proteus (*Necturus*), called "lizard" on the Great Lakes, which retains its outside gills when adult. Then these outside gills absorb or develop inwardly, and the future frog is in all respects a fish. It has a long embryonic fin that is eel-like, and begins back of the head and goes around the slim tail to the vent. Its eye is well developed, and the "herring bone" muscles in its tail can be plainly seen. It has a circular mouth, which can feed on either animal or vegetable matter. Its abdomen is large, and fitted for digesting vegetables. It rivals the ant in cleaning the flesh from delicate skeletons for the zoologist.

In this state it passes its first summer and goes into the mud in winter, and comes out hungry in early spring. Like all larvæ, it is a greedy feeder, and soon begins to show its growth and development by budding a pair of hindlegs, which are completed about the time the forelegs begin to show and the ears to develop. When these legs are fully developed the tail begins to absorb, and the frog has already begun to take oxygen from the air occasionally; it is changing from a gill-breathing fish to a lung-breathing animal. Think what this means: Lungs are growing and gills are being absorbed, yet in the intermediate state the animal can breathe with both organs. The absorption of the tail goes to nourish some part of the body, but the adolescent bullfrog is now smaller than the tadpole from which it changed.

Not only this, but its long, convoluted intestine, fitted to digest vegetation, has somehow changed to a shorter one, for the vegetarian requires a complex apparatus to digest its food, while the similar organs in the carnivora are simple, flesh being easier of digestion than vegetables. In proof, see the double stomach of ruminants, as cows, sheep, deer, rabbits and other cud chewers. They eat and swallow, and then lie down and chew their cuds like bicyclists. Perhaps man was once a ruminant, and the gum-chewing habit is a case of atavism, but that is a digression. We have seen that the tadpole changes not only its outward form to become a frog, but also all its internal economy; hence my statement that its transformation from a larval form to an adult one is as complete and wonderful as that of a caterpiller into a butterfly.

I want my young friend Jack and all other boys to note this evolution of the frog and the toad, which is the same, for their grandfathers will pay no attention to it, and their fathers will have little time to consider it, but a boy takes to such things, even if he learns no more when he gets into the money-grubbing stage; for boys, full of fun and jollity, often have a mental transformation which may be compared to the physical ones herein described.

Marketing of the Frog.

Once upon a time, many decades and nobody knows how many moons ago, I was a boy. It seems like a dream, or, as Tom Moore puts it in Lalla Rookh, "Like the faint exquisite music of a dream." Red blood was in my veins, and to storm a nest of bald-faced hornets had a spice of danger too tempting to resist. But there was an elderly Frenchman who lived in Albany, N. Y., away back in the 40s, who crossed the river to Greenbush to catch frogs to eat. We boys regarded a frog as a good target for a stone, but that a man should eat a frog was horrifying. So we preceded him and pelted every frog under cover, for John Atwood said—and he was old, was more than a dozen years old—that "There ought to be a law passed to stop people from eating frogs," and we boys agreed and looked upon ourselves as public benefactors in not only stoning the frogs, but the Frenchman as well.

My father, then agent for and part owner of the Eckford line of steamers and barges plying from Albany to New York, had in his employ a ship carpenter named Cornelius Lanigan, who brought me some cold fried frogs, and I ate them, and then caught a lot and persuaded my people to eat them; so I became a frog-eater over forty years ago, and through an Irishman.

Tons of frogs now come to New York markets each year. They are from Canada, Michigan and from the West and South, where the people have not yet learned to eat them; for there are practically none to be found near my boyhood frogging grounds, where I could easily get a hundred or more in a day. They do not get a chance to grow, for it is my belief that "an old rouser" of a bullfrog, with a body say 8in. long, is at least a dozen years old. I can't prove this from experiment, but believe it from the slow growth that several frogs of my acquaintance have made. One that had lost part of one hindfoot I knew for three years; it was about 5in. long when I first caught it, and had not grown over an inch in three years, although in a pool where food was plenty. As about 9in. is the limit, this frog had not ceased to grow.

In the report of the U. S. Fish Commissioner for the year ending June 30, 1896, p. 497, Dr. Hugh M. Smith give the products of the fisheries for 1894, and we find the following credited to the frog catch, which, as before said, is mainly sent to New York and other large cities: Arkansas 58,900lbs., value $4,162; Indiana 24,000lbs., $824; Missouri 154,818lbs., $9,676; New York 61,400lbs., $5,126; Ohio 14,040lbs., $2,340; Vermont 5,500lbs., $825. Total, 318,658lbs., valued at $22,953. No other States are quoted.

Few people outside the cities eat them. When the rural population take to eating frogs there will be none for the great markets. I have seen whole frogs skinned in Fulton Market, but usually only the hindlegs are used; for, except in the case of monster specimens, there is little meat on other parts.

An Outing in the Great Smokies.

IT was the first week in August, hot and dry, when the longing for a few days in our beautiful East Tennessee Mountains, "the Switzerland of America," became irresistible—a deep pool, a shady nook, a fly-rod, and the unutterable bliss of perfect quiet.

The Doctor, Howard and I started at 4 o'clock Thursday morning, intending to drive forty-four miles, stopping with our old friend Clisby, in the heart of the wild, weird Smokies. With a good team, a good lunch and plenty of luscious blackberries, such as we find only in these mountains, lining either side of the road, we felt that we were happy for the time at least, even if the fish didn't bite.

As we neared our destination we were startled by the sudden appearance in the bend of the road of a small, wizen figure, which we soon recognized as the wife of our friend.

"Wal, I do declar'! Howdy! I 'lowed yistidy to Clisby how as I reckon'd it wuz 'bout time you folks come a'ter some them fish hyarbouts. My ole man, he's up thar on the mount'in a-gittin' fire, and I'm goin' down yander ter the 'tater patch ter fotch some workhan's ter holp him. Make yerse'fs ter home," and before we could answer she had disappeared again as fast as her rheumatic legs would carry her, mopping her face with her apron.

A minute more and there was the picturesque old mill, with the huge trunks of monstrous forest trees piled high to one side, awaiting the leisure of the master. Parenthetically I might say that the owner of a mountain sawmill receives one-half of the lumber for his labor. Within a contracted loft just above the primitive perpendicular saw is the corn mill, where the grain is ground by the rubbing together of two large stones. The shackly and old-fashioned wooden wheel, together with the small flow of water over the leaky dam, forbid the synchronous running of saw and grinding of mill stones. The old man's delight in the anticipation of an hour's rest, while the mill with its dull stones is slowly grinding a bushel of corn, is more real than apparent when along the mountain trail approaches a mountaineer, his back humped under his sack of corn.

A little further, and there is the old fallen tree, serving as a foot log across the mountain torrent, which, dropping 15ft. over the dam above, joins the Little Pigeon just here, where it furnishes a cool home for the wary bass. The ever rushing, gushing water sounds always in one's ears until one might almost imagine he were at Niagara were it not that just across the stream is the old house, with its long row of beehives and great, spreading apple tree laden with fruit; the little porch with its shelf, on which stands the water pail and gourd, the wash pan, the common lavatory of this characteristic home. Just inside is the little hall, with its strings of red peppers hanging from the rafters, and its ladder going up through a hole to the loft above.

We took possession of our room, the one we had occupied on former visits and which served in our absence as a store room for all the best company paraphernalia. In one corner just over the hole in the floor, one of many where by election the cat comes through to make us a friendly visit and finish our lunch, is the ancient spinning wheel, with yarn for Clisby's winter socks.

Within a few minutes we have a one-gallowsed urchin off for minnows, leaving his companions standing with their mouths agape and their hands in their pockets watching our movements.

Too impatient to wait for his return, we search among the rocks along the banks for helgramites, and in less time than it takes to tell it the Doctor is off wading down the stream, slipping and sliding; and while I may have felt a jealous pang when he soon held up to view a lively red eye I was perfectly contented to sit, or rather lie, on my great boulder, drinking in the cool, fresh air, heavy with the aroma of pine and balsam; languid with the lullaby of the low murmuring river, the droning of locust and jar-fly; occasionally laughing at Howard stretched in quiet contentment on the opposite bank or the Doctor working like a Trojan down the river.

The next morning we were up bright and early after such a night's sleep as one can enjoy only when he has left the cares of business far behind, and can dream of his struggles with a 5-pounder. What was our disappointment to find a steady downpour of rain, the river risen several feet, and no prospect of a hold-up. But, like every true sportsman, we must make the best of our bad luck and content ourselves with a game of poker, matches serving as chips, rosy-cheeked apples as dollars; target shooting from the little porch; or a good novel for an hour or two.

The wholesome meals in these mountain homes are a great feature of the day's enjoyment. What can be better than fried chicken, ham and eggs, rich milk, fragrant butter and delicious honey? Clisby's tall, gaunt figure, with bent shoulders, is seated at one end of the little table; his thick, long hair thrown back from a low forehead, heavy beard, which gives the impression that he is all hair, were it not for the little, piercing blue eyes looking out from under overhanging bushy brows that twinkle when he tells of his "b'ar and wolf hunts yander on Balsam," or flash with the reminiscences of "the war."

He only leaves his mountain retreat once in every three months, when he comes to town to get his pension of $8. The Doctor, an Alabamian, naturally asked him how he happened to be a rebel.

"Wal, it wuz jes this er way: I 'lowed I'd go over yander ter Kintuck'—I had er purty good chance ter go—en I'd j'in thar. 'Bout that time I got 'thout eny money, en so I j'ined t'other side ter git some victuals, en when I wuz full I couldn't git out."

It was not unusual to be startled at a meal by a sudden thud, look up quickly, and opposite see the little woman smiling broadly, showing two snags, the only teeth she possessed, snuff brush in her mouth, and have her apologize by announcing "My corn jes hurt me that bad I reckon'd you-uns wouldn't mind my onhooken my shoe. Doctor, did yer ever see eny airysipelas?" and being assured in the affirmative continued, "I'm jes that ailin' en porely it actially seem like I can't stan' it."

On the morrow, the elements permitting, we determined to make a trip of about twelve miles further up the river to fish for mountain trout. After riding about six miles we were compelled to leave our horses and continue our journey on foot. Climbing all the while up, up, over rocks, through the vast unbroken forests, among the laurel and rhododendron, sometimes a precipice rising abruptly on one side, on the other the river in a deep gorge far below; through the gap the distant peaks, their summits just covered by a fleecy cloud.

We stopped to pick up Alex, a good, whole-souled, honest mountaineer, who had just been released from a three months' term in jail for "stilling," and was only too glad to join our lark, acting as guide, and carrying our lunch, frying-pan, etc. At Fort Harry we halted, put together our poles, got out our flies, and business began in earnest. My first cast with a brown hackle and Parmachenee-belle was rewarded with a fine trout weighing a little under ½lb. The fish in these mountain streams are not large, but they are numerous and gamy.

Then began our true sport—jumping from boulder to boulder, stopping at a deep pool, then on again to where the river was swift, so narrow at times one could jump across, the mountains rising steep from either side, the sky a little blue streak above, the water clear as a crystal.

So engrossed were we in our sport we did not realize the lapse of time, until suddenly coming upon Alex, seated on a rock, a string of fish by his side, from his very attitude we guessed he must feel that gnawing sensation closely akin to hunger. We soon had a bright fire, the trout sizzling in the pan, the lunch spread, a boulder serving as a table, and we fell too with the delight of children on their first picnic. Alex, like the true gentleman that he was, preferred the sardines, orange marmalade and deviled turkey (he had never seen either before), but trout were good enough for us. With a considerable show of secrecy, he drew Howard to one side, whispering, "I's seen turkey's what could fly an' them as couldn't, but that thar deviled un is a new un on me."

Then as the sun in all his majesty sinks lower and lower, seeming to melt into the earth beneath, leaving the heavens brilliant with his rich blues, gray and pinks, the dainty opalescent reflection in the east tells us—if omens may be believed—that we may expect just such another day on the morrow. Passing an occasional mountain lass driving home her cows, stopping to buy for a mere song the pure maple sugar for our winter's syrup, we wend our way homeward. As the summer's twilight deepens, the mountains become more weird in their purple, almost dusky, hue, but the moon in all her splendor now rises over the peaks, and then we are soon home, tired and hungry, but happy with our day's outing and sad to think that to-morrow we must bid adieu to our kind friends.

We gather around the crackling fire of hickory logs even though it be the first of August, for it is often cold in midsummer in these knobs, listening for the last time to Clisby's yarns, telling our own experiences and wishing that we might stay on indefinitely.

I must not neglect to tell you that for all this comfort and pleasure we pay at the rate of twenty-five cents a day apiece, and the same for each horse.

One would be inclined to say that theirs is a sordid, prosaic life, and that he would feel the want of something better, more ennobling. I perhaps would share with you this same feeling of oppressive narrowness in time, but no people on any spot on earth abound with more sterling qualities than those in these same East Tennessee Mountains. It is true the natives are cut off from all civilization, many of them never having seen a railroad; but they are good, honest and withal clever.

This was an uneventful trip in the point of great catches, but we are the richer by several pounds of flesh, feel better and are more able to meet and solve the perplexing problems of life, anticipating next time a hunt for one of Clisby's "b'ars" on Balsam.

E. WESTERN.

The Boquet River.

THE Boquet River, in its lower course, near Lake Champlain, is a good bass water. Bass are plentiful, but they do not average large. Albert Ferguson and a companion caught twenty-three small-mouths weighing 13lbs. near Little Falls, just above Whallonsburgh, a few days ago, using minnows for bait. Hundreds of small bass far below the legal limit in size are also taken from this stream.

The Boquet above Elizabethtown is a prolific trout stream, and trout are taken all the way down to the high falls at Wadham's Mills. Below this point the bass and pickerel from the lake have about cleaned them out, though trout are found in the small tributary streams, and occasionally taken in the main river. The Boquet is a beautiful stream from its furthest source, under Dix, in the Adirondacks, to its juncture with Lake Champlain, near Willsborough. Its waters are of crystal purity, and for most part it flows through rocky wooded land, or sandhills, where even the surface drainage is not apt to cloud it.

J. B. B.

A List of the Fishes Known to Occur in Manitoba.

BY ERNEST SETON THOMPSON, GOVERNMENT NATURALIST TO THE PROVINCE OF MANITOBA.

The nomenclature and arrangement adopted is that of Jordan and Evermann's Fishes of North and Middle America.* For the revision of this list and its correction up to date, as well as for other assistance, I am indebted to Prof. Barton W. Evermann, the ichthyologist of the United States Fish Commission.

1. **Ichthyomyzon castaneus Girard, Lamprey.**

Taken in the slough at Portage la Prairie on May 5, 1884. It was attached to a pike. They are common in Manitoba, but I have seen them only in the Assiniboine (C. W. Nash). Specimen identified by Prof. Evermann (E. and T.).

2. **Acipenser rubicundus Le Sueur, Lake Sturgeon.**

In great numbers in Saskatchewan, Red and Assiniboine rivers, * * * Winnipeg River and Lake of the Woods (Macoun). Lake Winnipeg (Taché), at Portage la Prairie. The river abounds in sturgeon also at Cedar Lake (Hind). This species is common at Winnipeg and in the lakes to the north (Eigenmann†). Nameyu of Crees: The great rapids which form the discharge of the Saskatchewan into Lake Winnipeg appear quite alive with these fish in the month of June (Richardson). The most important food fish in the Lake of the Woods.

3. **Ictalurus punctatus (Rafinesque), Channel Catfish.**

Winnipeg. Exceedingly abundant in the Red River, where it is caught in great numbers, especially at night (Eigenmann).

4. **Ameiurus lacustris (Walbaum), Large Catfish, Great Fork-tailed Cat.**

In Saskatchewan, below the fork. * * * Common in Lake Winnipeg and in the smaller lakes connected with it (Macoun). British America to Florida and Texas; abundant in all large bodies of water (J. and G.). Mattumeg of Crees: Sparingly in the lakes through which the Saskatchewan flows (Richardson).

5. **Ameiurus vulgaris (Thompson), Common Catfish.**

Vermont to Minnesota and southward; rather common (J. and G.). Manitoba (Jordan). Winnipeg (Evermann).

6. **Ictiobus cyprinella (Cuvier and Valenciennes), Common Buffalo Fish.**

Winnipeg, two specimens (Eigenmann).

7. **Carpiodes velifer (Rafinesque), Small-eyed Carp, Sucker.**

Winnipeg, Brandon; I can detect no difference between the specimens from Winnipeg and some taken in the Ohio River at Cincinnati (Eigenmann).

8. **Catostomus catostomus (Forster), Carp, Northern Sucker, Red Sucker.**

In great numbers in every part of the Northwest (Macoun). Mouth of the Souris (Hind). Winnipeg; said to be very abundant at Winnipeg during the winter (Eigenmann). Red sucker of fur traders, meethquamaypath of Crees. This fish is well known in every part of the country that lies north of Canada (Richardson).

9. **Catostomus commersonii (Lacépède), Common Sucker.**

Gray sucking carp, mouth of the Souris (Hind). Winnipeg, Westbourne, Qu'Appelle; very abundant everywhere (Eigenmann). *C. hudsonius,* gray sucker of fur traders, carpe blanche of Canadians, namaypeeth of Crees: A common fish in all parts of the fur countries; Cumberland House (Richardson).

10. **Moxostoma anisurum (Rafinesque), White-nose Sucker, Carp.**

Lake Winnipeg, Winnipeg, Brandon: This species is much less abundant at Winnipeg than the following (Eigenmann).

11. **Moxostoma aureolum (Le Sueur), Lake Red Horse.**

Winnipeg, Westbourne, Brandon (Eigenmann).

12. **Hybognathus nuchale Agassiz, Silvery Thick-jawed Minnow.**

Upper Missouri and Red River of North (Jordan).

13. **Pimephales promelas Rafinesque, Black-headed Minnow.**

Winnipeg, Westbourne, Brandon, Qu'Appelle; very abundant everywhere (Eigenmann).

14. **Notropis cayuga Meek.**

One specimen taken at Qu'Appelle by Eigenmann and described by him as new under the name *Notropis heterolepis.*

15. **Notropis blennius (Girard).**

Three specimens of this species were taken by Eigenmann at Winnipeg. It was also obtained by him at Brandon and Fort Qu'Appelle, and described by him as new under the name *Notropis reticulatus* (B. W. Evermann).

16. **Notropis cornutus (Mitchill), Common Shiner, Red Fin or Dace.**

A number of specimens of this were obtained at Brandon; none were seen elsewhere (Eigenmann).

17. **Notropis jejunus (Forbes).**

This species was found to be abundant at Winnipeg and Brandon (Eigenmann).

18. **Notropis atherinoides Rafinesque, Rosy Minnow.**

Winnipeg (Eigenmann).

19. **Notropis hudsonius selene (Jordan), Spawn-eater.**

Numerous specimens were obtained at Winnipeg, Brandon, Fort Qu'Appelle and Medicine Hat, and described as *Notropis scopiferus* by Eigenmann.

20. **Hybopsis storerianus (Kirtland).**

A number of small specimens from Winnipeg are probably to be referred to this species (Eigenmann).

21. **Couesius dissimilis (Girard).**

Lake Superior to upper Missouri region (J. and G.). Minnesota to Montana (Jordan).

22. **Platygobio gracilis (Richardson), Flat-headed Chub.**

One was obtained at Brandon, and I was told that it is abundant at that place (Eigenmann). Saskatchewan dace, no-matchee-gas of Crees: Abounds in that part of the Saskatchewan which flows through the prairie district (Richardson).

23. **Hiodon alosoides (Rafinesque), Gold-eye, Moon-eye.**

Abundant in all the rivers of the plains; Swan Lake (Macoun). Abundant in upper Assiniboine (E. E. Thompson). Abounds in Assiniboine at Portage la Prairie (Hind). This species is very abundant in the Red River at Winnipeg; was also taken at Brandon (Eigenmann). Oweepeetchessees of Crees, nuccaysh of voyageurs: This singular and beautiful little fish inhabits the lakes which communicate with the Saskatchewan in the 53d and 54th parallels of latitude, but does not approach nearer to Hudson Bay than Lake Winnipeg (Richardson).

24. **Hiodon tergisus Le Sueur, Toothed Herring.**

Winnipeg, Brandon (Eigenmann).

25. **Coregonus quadrilateralis (Richardson), Pilot Fish, Round Whitefish.**

Upper Great Lakes, northwestward to Alaska; abundant in cold, deep waters (Jordan and Gilbert).

26. **Coregonus clupeiformis (Mitchill), Whitefish.**

There is scarcely a lake throughout the vast interior which does not teem with whitefish. * * * Multitudes in lakes Manitoba and Winnipegosis (Macoun). Attihawmeg of Crees: An inhabitant of all the interior lakes of America, from Erie to the Arctic Sea (Richardson). It is not certain, however, that all these references really refer to this species. Many of them may belong to *C. labradoricus* (B. W. E.).

27. **Coregonus labradoricus Richardson, Musquaw River Whitefish, Labrador Whitefish.**

Common in Lake of the Woods, and often mistaken for the common whitefish (*C. clupeiformis*), which is not known certainly to occur in that lake, though I have examined one specimen which is said to have come from Lake Winnipeg (Evermann).

28. **Argyrosomus artedi (Le Sueur), Cisco, Lake Herring.**

Great Lakes and northwest to Alaska and Labrador, very abundant, usually frequenting shallow waters (J. and G.).

29. **Argyrosomus tullibee (Richardson), Tullibee.**

Great Lakes and Northwest (J. and G.). Ottoneebees of the Crees: This fish is very generally diffused through the waters of the fur countries; Cumberland House (Richardson).

30. **Thymallus ontariensis (Cuvier and Valenciennes), Michigan Grayling.**

Northern Michigan to Montana, northward to Alaska and the Arctic Ocean (J. and G.). Scarce (Jordan).

31. **Cristivomer namaycush (Walbaum), Lake Trout or Namaycush Salmon.**

New Brunswick to Montana and Northwest (Jordan). A denizen of the great lakes that lie between the United States and the Arctic Sea (Richardson).

32. **Salvelinus hoodi (Richardson), Masamacush (Gill and Jordan).**

Common in every river and lake from Canada to the northern extremity of the continent (Richardson). Probably identical with the next species.

33. **Salvelinus fontinalis (Mitchill), Speckled Trout.**

Maine to Dakota and northward (Jordan). Arctic North America; rivers and lakes of British North America (Günther).

34. **Percopsis guttatus Agassiz, Trout Perch.**

Winnipeg Lake, Winnipeg, Brandon: This species is abundant in almost all streams from Winnipeg to Medicine Hat (Eigenmann).

35. **Lucius lucius (Linnæus), Pike or Jackfish.**

Lake Winnipeg. * * * Found in every river and small stream throughout the country (Macoun). Little Saskatchewan (Hind). Winnipeg, Brandon, Westbourne. This species is common throughout the North and is one of the most prominent game fishes (Eigenmann).

36. **Lucius masquinongy (Mitchill), Maskinonge or Muskellunge.**

Great Lake region and Northwest (J. and G.).

37. **Pygosteus pungitius (Linnæus), Nine-spined Stickleback.**

This species was obtained in the clear waters of the Qu'Appelle River; it was not noticed elsewhere (Eigenman).

38. **Eucalia inconstans (Kirtland), Brook Stickleback.**

Qu'Appelle (Eigenmann).

39. **Ambloplites rupestris (Rafinesque), Rock Bass.**

Vermont to Great Lake region and Manitoba, south to Louisiana (J. and G.).

40 **Eupomotis gibbosus (Linnæus), Common Sunfish.**

Great Lake region. * * * Northern parts of the Mississippi Valley; one of our most abundant and familiar fish (J. and S.).

41. **Micropterus salmoides (Lacépède), Large-mouthed Black Bass.**

Red River of the North (J. and G.).

42. **Hadropterus guntheri (Eigenmann and Eigenmann).**

Winnipeg, three specimens (Eigenmann).

43. **Boleosoma nigrum (Rafinesque), Johnny Darter.**

Specimens of this species were taken at Westbourne and in the Assiniboine at Brandon (Eigenmann).

44. **Hadropterus aspro (Cope and Jordan), Black-sided Darter.**

Four small specimens of this species were taken at Winnipeg and a number at Brandon (Eigenmann).

45. **Etheostoma iowæ Jordan and Meek.**

Fort Qu'Appelle; a single specimen (Eigenmann).

46. **Perca flavescens (Mitchill), Common Yellow Perch.**

Seems to be abundant. * * * I obtained this fish in Lake Winnipegosis, Swan Lake, and in the small lakes at the head of the Red Deer River (Macoun). Abundant at Fort Qu'Appelle, Brandon (Eigenmann).

47. **Stizostedion vitreum (Mitchill), Wall-eyed Pike, Pickerel or Doré.**

Great Lake region, upper Mississippi, and some Atlantic streams north to the fur countries (J. and G.). Lakes Winnipeg, Manitoba and Winnipegosis. * * * Red Deer River (Macoun). Souris River (Hind). Mouth of Nelson River (Evermann). Winnipeg (Eigenmann). Skow of Crees, hornfish of fur traders: Inhabits the rivers and lakes of the fur countries to the 58th parallel (Richardson).

48. **Stizostedion canadense griseum (De Kay), Sauger or Sand Pike.**

Winnipeg, Brandon (Eigenmann).

49. **Roccus chrysops (Rafinesque), White Bass.**

Great Lakes, Mississippi Valley and Northwest (J. and G.).

50. **Aplodinotus grunniens (Rafinesque), Fresh-water Drum.**

Winnipeg; abundant (Eigenmann).

51. **Cottus spilotus (Cope), Miller's Thumb.**

Great Lakes in deep water, and northwest to Hudson Bay (J. and G.).

52. **Lota maculosa (Le Sueur), Ling, Burbot, Methy or La Loche.**

Common in all the lakes on both sides of the mountains (Macoun). Great Lake region north to Arctic Seas, abundant (J. and G.). Exists in every river and lake from Canada to the northern extremity of the continent (Richardson).

CHICAGO AND THE WEST.

Still-Fishing for Big Pike.

Minneapolis, Minn., Aug. 26.—At this city I met Rolla Heikes, the famous trap-shooter. Mr. Heikes follows shooting with great steadfastness and success, but when he wishes relaxation and recuperation, as for instance when he is in preparation for an interesting contest at the traps, he takes to the woods and goes a-fishing. Shooting he regards as splitting wood, I imagine, but fishing he looks upon as a sport, because he does not do that all the time and does not make a living out of it. Mr. Heikes is a consistent performer with a rod, however, as with the gun, and has a skill of no mean sort. Last summer he wandered up into Wisconsin and discovered a lake called Long Lake, about fifty miles south of Ashland, where he had some very nice sport, chiefly with bass. This summer he went up there again, and tried for some of the bigger fish which are to be found in those waters. These fish are not the muscallunge, for the Long Lake waters do not flow into the Mississippi River. The great fish which there tear up the tackle of the anglers are the great northern pike, and they reach a very formidable size, as Mr. Heikes learned last year. This year he resolved to get into closer acquaintance with some of them and went prepared.

In those waters he found a custom not common in the muscallunge regions. The best guide, who knew the country thoroughly, showed the party that the best way to catch these big pike was not by trolling or by casting (the two accepted ways of fishing for muscallunge), but by still-fishing. The bait used was a perch a little longer than one's hand, which was baited by passing the hook under the back fin. Above the bait, at a distance of a few feet, there was fastened a bob or float, which kept the bait and hook at a given distance above the bottom. The big pike feed along the bars out in the middle of the lake, where the water comes up shallow, in spots known to a few of the older guides. Here the anglers lie at anchor and cast out the bait a good ways from the boat, letting the float keep the big perch free of the weeds. When the pike begin to feed they can be seen moving around the bar, and it was often the case that they caught several in an evening's fishing from 8 to 16lbs. in weight. The fish struck after the fashion of pike, going off with a strong run, the float going down and down until it was entirely out of sight. In play the fish were very free and strong, and they went out of water like the muscallunge. They gave fine sport.

One day, just at noon, when he was not expecting a bite, Rolla noticed his float begin to act strangely, and presently it began to move off and then to sink. It went down and down, until finally he thought it time to strike. He did so, and so developed a whirlwind at the end of his line. The big fish made a long rush away, and then headed straight back for the boat, under which it passed at railroad speed. The anchor was down, and it seemed that something must be torn loose, but by care the boatmen got up the anchor and transferred the fight to the open water. Here it was nip and tuck for a long time, the great pike going off in long swift rushes, and then again sulking deep down. As he had 100yds. of line on, Mr. Heikes was able to maintain his control over the fish, and at last began to see it often near the top. After a fight of half an hour they got the big fellow alongside, and the oarsman dropped his fingers into the eye sockets of the pike and lifted him into the boat. (It is a fact perhaps not known by all that pike can be taken up thus by the eye sockets, and will not make much flurry or resistance, being apparently helpless and paralyzed by the grip at the eyes, whereas it would

break away and go into all sorts of fits if touched on the body.) Once in the boat, the captors fell upon the big fish and held it down, though with difficulty. Mr. Heikes shows a badly lacerated thumb as a result of his share of the fight. At the hotel the fish was found to measure 43in. in length, and it weighed 26lbs. 3oz.—certainly a very fine specimen.

Talking with some Eau Claire men about this fishing country, one of them invited the lucky pike angler to try and catch a certain fish which he saw for a brief moment, and which he says was long as a fence rail.

Mr. Heikes says he is going up there again next yea- Lost Lake, on the Tea River, a tributary of the Flambeau, where according to his report the muscallunge fishing is very fine in season. I do not know this water, and have not known any Chicago parties who have visited it.

Long Lake is a bit famous for these big pike, and is worth bearing in mind. It is near Drummond Station, and I understand there are good accommodations there.

The Fish Commission of Wisconsin has lately been engaged along the bayous and pond holes of the Mississippi River, seining out the landlocked young fish and returning them to the main waters. There is no more practical form of fish protection or fishculture than this. Such fishes are known to be native to such waters and it goes without saying that they will thrive there better than importations, and their size when taken in salvage is sufficient to assure their life when restored to the main waters.

I had a curious instance of the growth of the preserve idea offered me the other day in Iowa. It was at Newton, near the Skunk River, which was once a very fine fishing stream, as I personally know. Of late years the trot lines, nets, seines and dynamite cartridges have so depleted this stream that it is hard to catch a mess of any kind of fish whatsoever in a day's work with hook and line. Seeing that this is so, a young man with whom I was talking went on to tell me, a little party of three or four young married men had just concluded to lease a little piece of land, some half a mile or so in extent, which inclosed a little open lake out in the middle of the bottom lands of the Skunk River. Here, they had figured it out, they could employ a neighboring farmer as a keeper and could see to it that no one came in to shoot or fish on their property. They were intending to stock the water with bass, perch and rock bass, to plant wild rice and rushes, and to try for a little summer place, where they and their families could occasionally go down to the river with some prospect of getting a few fish or a few ducks in season. This they had figured out for themselves pretty much independently and on original lines. I don't think any one of them had ever seen inside a sporting paper, or had ever given the preserve system any considerable thought. Yet it was easy enough for them all to see that the old open ways of the past had ruined all chance of sport in that country, so that they must do something to keep out the unbridled public if they were to have the least of game or fish for themselves. I imagine that they may at first have some trouble with local farmer boys and others who have so long been used to doing as they liked without reference to the law, but after a while they will be able to gain respect for their property and respect also for their purpose of retaining a few of the original birds and fishes of that part of the world. Never was worse harried section than that, and so far as I can learn the State Fish Commission of Iowa has never heard of it, and such a thing as a game warden is an unknown quantity. I used to tramp all over that open and then wild country when I was much younger, and at that time, I presume, I should have thought it impertinence of a very gross sort which should have told me when I should rise up or sit down in my wanderings, or which should have told me I could not fish and shoot as I liked. Thanks to a good training at the hands of my father, who seemed always to have had the principles of moderation and decency in sport in his heart, long before the days of necessity or education in such matters, I was early in rebellion at the old wasteful ways, which it was easy to see would soon destroy the sporting resources of our country. There were not a half-dozen families in our village which did not laugh at such foolish notions. The story since then has been that to be read all over the country. Those who do not like the preserve idea may thank themselves that they have it. And it is bound to come.

Many Years.

Perhaps some sportsmen who travel out of the Chicago & Northwestern Depot of Chicago may have seen in the general passenger offices an old and white-headed man who writes tickets for the fortunate, and who has been head ticket clerk there for a long time. This is Mr. Franklin Price. This week when I saw Mr. Price he gave me an envelope containing the announcement of his fiftieth wedding anniversary, on Aug. 31 of this year.

E. HOUGH.

Bass and Trout in Croton Basin.

CARMEL, N. Y., Sept. 3.—The fishing in Gleneida Lake and the other lakes in this vicinity, which have been included in the water supply system of New York city, has been very good throughout the season. Black bass weighing from 2 to 6lbs. are caught almost anywhere in the lakes, and pickerel and eels have perhaps never been more abundant. In so far as fishing is concerned the lakes and ponds in this section are considered public property, and no attempt has been made by the city authorities to keep fishermen away.

The ponds and lakes in this vicinity include Lake Gilead, Gleneida, Reservoir D, Southeast Reservoir, Drewsville Dam, Boyd's Dam, Pine Pond, Barrett Pond, China Pond and Lake Mahopac.

Mr. L. E. Cole, of this place, has been experimenting with salmon trout. He placed them in Lake Gleneida four years ago. An occasional one has been caught every year since they were put in the lake, and the experiment is undoubtedly a success.

Tuna and Tarpon.

Editor Forest and Stream:

Allow me to add a word to the discussion of the tuna fishing at Catalina Island, as compared with tarpon fishing in the Gulf of Mexico, in favor of the tuna as the harder fighting fish.

My tackle is the same as that used for tarpon, excepting that a reel holding 900ft. of line is necessary for the tuna, while 600 was ample for tarpon. This is owing to the strength and speed of the tuna, whose rushes require more line.

It was after an hour and a half of the hardest sort of fight that a tuna weighing 148lbs. was brought to gaff, while a tarpon of about the same size was tired in thirty-five minutes, using identical tackle.

The tuna is swimming about constantly in pursuit of the flying fish, while the tarpon is satisfied with less animated food, and it is for this reason that the tuna is the more powerful and swifter swimmer of the two.

The method of trolling with flying fish also is more agreeable than still-fishing in the blazing sun, as one always has a breeze to keep one cool, even if the fish do not bite, while in Florida the weather conditions are apt to result in heated language on the part of the patient angler, after he has watched the sun climb to the zenith, without getting anything but catfish for his roasting.

M. C. ARNOT.

Camp-Fire Flickerings.

"That reminds me."

A FEW old sportsmen were relating their experiences to each other, when an interloper drew up and interrupted them with a few stories of his hair-breadth escapes, much to their disgust. Finally one chipped in and quietly told the following story:

"Three or four years ago I was hunting in the Rocky Mountains and happened to be on the top of a high precipice, and for the purpose of getting a better view of the valley, some 500 or 600ft. below, laid down my gun and crawled out upon a small rock overlooking the chasm, and strangely fell asleep.

"Presently I was awakened by a noise on the bank and saw a large bear within a few feet of me. Of course, I was powerless, as I could hardly move without falling from the rock and I could not escape to the bank nor reach my gun, which was beyond the bear.

"Presently the bear crawled down slowly until he stood squarely over me on the rock."

After a short pause the interloper asked: "What did the bear do?"

"Ate me up."

Dogs, Coons, Possums and Rifle.

JAMESON, Tenn.—*Editor Forest and Stream:* I want to tell you about some coon hunting and a famous dog that once belonged to me. I had been running hounds for a number of years when, with the turn of the tide, I found myself the owner of but one dog. He was a grand red hound, and had been a leader in the fox chase. He was for a number of years my companion along the highways and hedgerows of our section of middle Tennessee.

About this time something commenced to trouble my chickens at night. I encouraged the dog to run whatever it was, but met with poor success at first.

Finally one night there was a great commotion among the chickens. I was out in a jiffy with the dog, and in two minutes he had chased something to the nearby woods, and was baying. I was soon on the spot, and found him barking up a tall chestnut, standing somewhat apart from the other trees. The top was thickly set with leaves and I could see nothing. I was anxious to kill whatever it was. The time was then about 12 o'clock, and I was not willing to sit up until daylight, so I fastened a lighted candle on the side of the tree and went back to bed.

Next morning I went out early. The dog had stayed at the tree and the candle was still burning. Either the dog or the light, maybe both, had kept the game up. It proved to be a coon, and was traveling out first on one limb and then another.

The coon usually takes up its position in the main fork, and stays there, but this one was restless and was trying to make its escape. The first shot from my rifle brought it down. It proved to be an old suckler. The chickens were not troubled again soon, and from that night the dog was the greatest coon dog I have ever seen. I have owned a number of good ones, but this one stands a star among them.

During the summer, after what I have related, many and many a morning I waked to hear him barking in the woods, and many are the times I have gone to him and dropped my coon.

As soon as possums and 'tatoes were ripe, I commenced to hunt at night. He proved as good on possums as he was on coons, and he had this peculiarity: He wouldn't cry the track of either, but just slipped right up on them.

My manner of hunting may interest some readers of FOREST AND STREAM. I believe it in part original; at least I have never heard of any one trying my plan. I usually climb after the possums and shoot the coons, using a rifle. This shooting can only be done when the moon is shining, but it need by no means be full. I have killed them when it didn't look larger than my hat.

My plan is to go to the tree, then back away, keeping the tree between me and the moon. The coon is easily seen. When the moon is on a line anyway near him his fur commences to shine, and when it is near him he looks like a polished silver ball. I get the coon at the lower edge of the moon, then bring my gun up from below. In this way a fine sight may be taken. More care needs be taken than in the daytime, but equally as correct a sight can be taken as in the daytime. Should the object be missed and a limb struck, the particles of bark that fly look exactly like a puff of smoke from a cigar, so one may see exactly how close he is shooting.

Should any coon hunters read this, I hope they will try my plan of shooting. It is certainly very fine sport. I have killed coons a full hundred yards or more.

On one occasion I was hunting with a friend of mine in the hill country, and we were standing on a point of woodland overlooking a field. The dog, being a wide hunter, crossed the field and commenced to bark on the hill beyond. We found him treed up a large oak, standing on a high bluff. The moon was low, and I had necessarily to get a long way back. The coon was finally located near the top. The distance was so great I told my friend I never could kill that one. I was using a small rifle too, but the first shot struck dangerously close, and the third one brought him down. He was a large coon and was only crippled, so was ready for a fight. A young hound had followed us that knew nothing about coons, but he soon found out something to his sorrow. He was the first to take hold. The coon fastened his teeth in the dog's ear. The dog began to bawl and pull back. I put my foot on the coon. The dog continued to pull and split his ear almost from one end to the other, making a noise like the tearing of a piece of canvas. On the way home that night we got another coon, but he was low down and was easily killed.

I remember well the last coon I killed while I owned this dog. I was hunting in the flat country, along a willow branch. Some distance from me one round hill rose from the level and stood like a sentinel. Its top was crowned with giant forest trees. The dog went to these and found a coon. He was so far away I am certain I did not hear him when he first commenced to bark. When I did hear him, I hardly could, but I knew him well. I found the coon lying in the fork of one of these large trees. The moon was small and was almost straight up. I stood near the root of the tree to shoot. The coon was looking down at me. The ball struck him in the face and he tumbled right down at my feet, and was dead almost by the time he struck the ground. After that the dog came up "strayed or stolen," and I have not seen him since.

BACKWOODS.

The Hound Pup.

BY ADDA L. NICHOLS.

I JUST wish that dapper little drummer who said Priceville was a dead town could 'a' been here the day the train came in with Joe Borden's hound pup.

To be sure it wasn't a much for lookin' pup, though they do say it's a fancy breed an' has a registered pedigree.

However, I don't believe that would have made any difference to the drummer, for he, most likely, had been disappointed in business or crossed in love, probably both. Anyway he was soured in disposition from some cause or he wouldn't have called our town dead.

Dead, indeed! Why, that dog wasn't more than handed out o' the baggage car 'til every man in sight was on his way to the depot. Actually they stood so thick about the express truck I couldn't even see the box he was shipped in, an' I was standin' on my tip toes too.

What? well, I don't know why I shouldn't want to see, if I am an old maid keepin' a milliner shop. Neither one o' them things prevents a body's wantin' to know what's a-goin' on, so far as I've ever heard.

You didn't mean any harm, you say, never mind! I s'pose you didn't. But, as I was sayin', you'd ought to 'a' seen those men. They fairly fell over each other tryin' to be the first to get a look at the pup.

Old Uncle George Merriman, that keeps the corner grocery, went clear up there without his hat an' coat, though it was an' awful cold day, you could see the wind flutterin' his white shirt sleeves, an' wavin' the little fringe o' gray hair below his shiny, bald pate.

John Rider, bein' a clerk, was obliged to stick to his customer. But it was Mrs. Bartlett he was waitin' on, an' she told me herself that she had to ask him for a lamp chimney three times, while he was stretchin' his neck out o' the window, before she could make him hear.

Dead, indeed! Why, it's wonderful the interest our citizens take in things. All the men that had help in their stores left and run soon as they heard about it. Harry Houston locked up the bank and hurried off without his cane, for all he has such terrible rheumatism. He got a bad crack in his back while he was up there, so the men had to load him in a buggy an' haul him home. I thought for a time he'd got more attention than the dog. But he didn't. 'Twasn't natural that he should, he's just an ordinary man, an' you don't see a bloodhound with a registered pedigree every day.

I reckon you've heard how smart the pup turned out? No? Well, did I ever! Oh, yes, I do remember now about your trip to Ohio, of course you couldn't know.

Well, you see, Joe hadn't had his dog more'n a week when Middleton's store was robbed. There was a lot o' goods stolen and some money, the whole thing

amounted to something like seventy-five dollars' worth.

Middleton was the first man at the store that morning himself, and he hadn't more'n got inside till he saw what was wrong. So he came out on the pavement an' told it.

Of course there wasn't much else done that forenoon but talk over the robbery, an' everybody that couldn't get into the store set on the hitchin' rack an' discussed the best ways to find the thief.

Finally Rube Jones, the fire insurance agent that came here about a year ago, you recollect, stepped in, sort o' finified, with his patent leather, toothpick shoes, an' says he, "Have you looked for tracks?"

There'd been a little shower in the night that laid the dust considerable, an' soon as he spoke Middleton (like a drownin' man catchin' at a straw) went out the back door. An' there, sure enough, was great big, broad-soled tracks, plain as day.

Yes, you're right, they followed 'em, an' they led straight as a string to Lon Davis' house over in the edge o' town.

Well, that settled it, the shoes was like Lon's, an' he'd always been shiftless an' ornery; in jail once, you know, for stealin' meat, though I'll always believe Lon wouldn't 'a' stole if he hadn't been hungry. So they took him up an' searched the house, but they couldn't get any trace of the goods.

It would have broke your heart to see Lon's wife an' the children cry an' cling to him, when the sheriff led him away. Poor things! he wasn't worthless an' triflin' to them.

Somehow or other Joe Borden hadn't thought of his bloodhound 'til they couldn't find the stuff that was missing, an' Jim Brady began to twit him of it.

You see, Jim sets up for a detective, an' he's always been kind o' jealous of the dog.

Joe got the pup right off after that, an' took him up to the store, an' they do say the little thing acted real intelligent. Anyway he smelled round a bit and took along the trail o' them tracks to Lon Davis', givin' tongue every two or three jumps, with all the men in town spurtin' their best to keep up.

When he got there he run over Lon's little grass plat a few hile, as if he was confused. Then he started again, faster than ever, an' never stopped until he came up to Rube Jones' insurance office. And there it was they found the stolen goods. Even the old shoes, like Lon's, was found in a valise stuck away up in the scuttle hole.

Well, Joe had all he could do to keep the dog off o' Rube; an' Rube squirmed more like a cornered garter snake than anything else I ever saw, when they arrested him.

But you'd ought to see Lon Davis' kids pet that dog, an' as for Joe, don't ever ask him about it, for he can't talk of another thing but that hound pup.

Points and Flushes.

Notice has been sent out by the secretary of the A. K. C., to the club delegates, giving notice that the regular quarterly meeting of the club will be held in the A. K. C. office, 55 Liberty street, on Sept. 22, at 2 o'clock P. M. Also at 4 o'clock P. M. the committee on membership will meet for the purpose of receiving and acting on applications for admission to membership, and for approving the credentials of delegates whose names will be submitted to the club at its meeting the following day.

Mr. Geo. W. Clayton, Box 914, Chicago, Ill, will superintend the first annual show of the Texas Kennel Club, to be held at Dallas, Texas, by the Texas State Fair and Dallas Exposition Association, Oct. 4 to 8. Entries close Sept. 19. After Sept. 15 Mr. Clayton's address will be Dallas, care of the association aforementioned. Mr. Clayton further informs us "that arrangements have been made for the free transportation of all dogs collected at Chicago, St. Louis and Kansas City, so this should insure a big entry."

Yachting.

As the yachting journal of America, the FOREST AND STREAM is the recognized medium of communication between the maker of yachtsmen's supplies and the yachting public. Its value for advertising has been demonstrated by patrons who have employed its columns continuously for years.

THE yachtsmen of the Clyde, after ample experience with the fin-keel, are now busy with a plan for a restricted class of 42ft. L.R. yachts, a return to the useable craft of ten years back. The Yachtsman says:

Nothing definite has yet been done about the new class of 42-footers for the Clyde, although much has already been tacitly settled by those who are leading in the matter. The bandbox style of scantling and rabbit hutch type of accommodation are to be severly tabooed, and the boats are to be of one design, about 42-footers, not any less, with good quarters for both owners and crews, and with neatly fitted and well furnished ladies' cabins. If the boats can be got for about £700 each ($3,500) there is every probability that several will be proceeded with; in fact no fewer than five owners are in such hearty sympathy with the movement that they are expected to build. The root idea of the whole matter seems to be the one well calculated to make for the good of yachting. It is in brief to try to secure a good and smart boat, at a reasonable but not mean figure, for such yachtsmen as cannot afford to maintain an expensive and otherwise almost useless machine, and a steam yacht to attend on her. It will be well for the best interests of the sport that they should be successful.

This proposed class would probably run to about 38ft. l.w.l.; or, allowing for the fuller L.W.L. and the added overhangs of the more moderate of the modern type, it would make a boat about as large as Minerva. The idea is similar to that suggested last year for a larger size by the Newport owners of the 30ft. class. The plan is just one more indication of the direction in which all yachting is trending.

Yacht Measurement.

THE writer of the following, Mr. R. E. Froude, of the Haslar Experimental Laboratory of the British Admiralty, has been very closely connected with measurement discussion and legislation in England, and is an expert on the subject of measurement:

Editor Forest and Stream:

I am much obliged to you for sending me your issue of July 9, containing an editorial article on "Girth as a Factor of Measurement." With your reasoning in this article—on your statement—I concur in the main; but you do not appear to correctly appreciate the purpose with which the girth measurement was introduced into this country.

You premise "that the direct end in view is the inducement of the designer to take a larger area of midship section, at the same time leaving him free as to the proportions and form of this area." Without professing to answer for the motives of every individual concerned in the introduction of the girth measurement of our present rule, I think it may safely be said that the general end in view was not what you describe in the above words, but was in one sense at least its precise converse.

The end in view was expressly not to leave the designer free as to the form of the midship section; but rather to induce him to take a more compact form; to take a larger area maybe, but expressly a larger area relatively to the extreme cross section dimensions. And this end is directly promoted by the introduction of girth tax (coupled with beam tax, to which you make no reference), in complete or partial substitution for sail tax.

Qua effect on hull design, a sail tax is broadly equivalent to a tax simply on sail-carrying power, without distinction as to the means whereby that sail-carrying power is achieved. Now sail-carrying power, as your argument implies, is the product of two factors, weight and leverage; so that a given sail-carrying power may be achieved by a small weight and large leverage, or a large weight and small leverage, or any intermediate combination. And the tax on sail has been found to promote recourse to the former alternative in a very undesirable degree.

Manifestly, then, the natural and most direct corrective of this evil is to replace, wholly or partially, the tax on sail-carrying power achieved (as conventionally measured by actual sail spread), by a tax on the leverage factor which helps to achieve it; this leverage factor being conventionally measured by the extreme cross section dimensions, of which girth may be taken as one.

This, then, is the true *raison d'etre* of the girth element in the present English rule. It was introduced, in addition to a tax on beam, primarily to stop the unlimited recourse to draft, which a beam tax alone would have encouraged. Girth was chosen for this purpose, in preference to draft, partly for convenience, but also, and rather as an afterthought, for the sake of the direct encouragement of a compact type of section, which is afforded by the girth measurement taken along the curve of the sectional outline.

It has been above contended that the substitution of a leverage tax for a sail (or sail-carrying power) tax is the natural and most direct cure for the tendency of the latter to promote undue recourse to leverage instead of weight. It is instructive to notice that similar reasoning would lead us to expect much the same result (so far as hull design goes) from an increase of sail tax, accompanied by a premium on the weight factor, as measured either by displacement or sectional area.

Hence I conclude—speaking quite broadly and generally—that, subject to the adjustment of coefficients, there is no reason why formulas such as proposed by Mr. Hyslop and Mr. Herreshoff should not have much the same practical effect on hull design, either as the present Y. R. A. rule, or the intensification of it lately proposed, wherein the sail tax was discarded entirely in favor of an increased B. and G. tax.

This reasoning of course applies only to boats with fixed keels: as regards centerboards, the hull effect of the two kinds of rules here contrasted would, of course, be very different. But setting this on one side, the chief essential difference in practical effect would lie merely in the matter of canvasing, i. e., relatively to stiffness. That is to say, the Herreshoff or Hyslop type of rule would strongly promote under-canvasing, while the Y. R. A. rule or its intensification would do so to a less extent or not at all.

Whether the promotion of under-canvasing is to be regarded as a boon or the reverse is, I suppose, mainly a matter of taste. But, as a matter of principle, I wish to lay stress on what seems to me an almost fatal objection to any form of rule which, like the Hyslop and Herreshoff rules, puts a direct premium on any measured element of size. The primary and legitimate function of any rating rule is to measure size, in order to eliminate the element of mere "size" from the competition. When, therefore, a rule directly provides that by increase of some measured dimension the rating for racing is decreased, such rule clearly contradicts this primary and legitimate function, and avowedly becomes a mere engine for the control of design.

Every practicable rating rule must indeed operate in some measure to control design, whether we wish it or no; and when a rule is found to do so prejudicially, it is quite legitimate to so readjust the incidence of the taxations as that it may so far as possible control design advantageously instead of the reverse. But to do this in such a way as to patently subvert its primary function of size measurement is, in principle at any rate, to take a distinctly new departure.

R. E. FROUDE.

GOSPORT, Aug. 9.

We are so nearly in accord with Mr. Froude on many points, and in fact with some other of our correspondents in this discussion, that it is difficult to argue against them. In this case, where Mr. Froude differs from us it is not in matters of principle, but rather in minor details, which depend largely on very clear and accurate wording.

It is possible that in the sentence first quoted by Mr. Froude we have failed to cover in a few words a statement that is capable of considerable amplification. We quite understand that in framing the present Y. R. A. rule it was intended to limit the designer to a certain extent in the use of extreme forms of section, such as the fin-keel or the Glencairn type; but, on the other hand, we have not understood that it was the intention to force him to the other extreme of one stereotyped section. It was, as Mr. Froude states, intended to promote "a larger area relatively to the extreme cross section dimensions;" but even in doing this we do not understand that there was any intention of restricting the designer more than was absolutely necessary in his choice of proportions and dimensions.

Our criticism, although expressly directed at girth as used in the British rule, was written entirely from an American standpoint, and from that standpoint we believe that our statement is correct. The range of types in current use in this country is very much larger than in Great Britain, and the centerboard type claims a prominence here which it does not on the other side. It is impossible that any yachting body in this country should follow the course of the British Y. R. A. in absolutely excluding all centerboard types. In order to be accepted here, a new rule must do all that Mr. Froude claims, and in addition must leave the designer the greatest possible freedom in the selection between the centerboard and keel types. It must penalize the fin-keel and the big Glencairn, but it must leave it possible (to take an instance from well-known boats) for a Nymph of the moderate centerboard type to compete fairly against a Minerva of the normal keel type.

The point which we made is that the use of girth and beam, as in the Y. R. A. rule, tends to produce a certain fixed form of section; for instance that, applied to the class of the two boats just quoted, it offers strong inducement to the designer to take a beam of about 10ft. and a draft of about 9ft., and discourages him from such dimensions as 14ft. beam and 6ft. draft. The latter represent the moderate type of deep centerboard boat, one whose value in American waters has been proved beyond question. While as a mere matter of private opinion, we do not believe that the latter as represented by Nymph and Harpoon can win races from the former as represented by Minerva and Gloriana, at the same time we believe that an American rule should go as far as possible toward giving an equal opportunity to each type.

The question which Mr. Froude raises over the taxation of sail is a very nice one, but perhaps of more importance in theory than practice. We are again confronted on this side with peculiar conditions. The tendency in America has always been in the direction of overcanvasing, a matter of habit and tradition perhaps, but none the less strong on that account. We quite agree that a most effectual remedy for overcanvasing may be had by means of limitation; but it seems to us that the conditions on this side are such as to make the other method of a tax on sail itself more practicable. The principle of taxing sail is now well understood and almost universally accepted in America, but the principle of taxing the levers—beam and draft—is as yet unknown. In securing any general recognition of the latter principle, as contemplated in Mr. Hyslop's proposal, it is probable that much more can be accomplished by means of a moderate tax on dimensions, coupled with the existing tax on sail, than by entirely discarding the latter and working for what must seem to be very severe restrictions on beam and draft alone. The former stands a chance of being understood and accepted, where the latter would probably be rejected.

We are quite willing to accept Mr. Froude's conclusion, that the general result of all the rules under discussion will be the same; but from an American point of view it is impossible to set aside the centerboard type. We do not believe, however, that the Hyslop proposal, which is very different in principle, would promote undercanvasing, or that it would do more in this direction than to check the development of excessive sail plans. In discussing "undercanvasing," as Mr. Froude puts it, a great deal depends on the point of view: what would be considered a very moderate rig in America would be looked on in England as excessively large.

The final point, whether a rule of the Herreshoff type, with displacement or an equivalent factor as a divisor, is admissible on principle as a measurement of "size," is new to us, and we are not prepared to discuss it at present, as it pertains to the domain of theory, and there are numerous other matters of practical value to be dealt with just now if anything is to be done within the next two months. It may really be an interesting departure in the principles of measurement, but even so it may be left until it is decided whether the Hyslop formula offers sufficient promise of success in practice to warrant its trial. We regret that Mr. Froude has not touched upon the specific points that we urged against girth as an inducement to a greater area of section; and that he has not undertaken to discuss the principle of Mr. Hyslop's formula in comparison with the formulas proposed by Mr. Herreshoff and others.

The Y. R. A. and the America Cup.

AT the meeting of the British Y. R. A. at Ryde on Aug. 13 the following letter was framed, in answer to the application of the Royal Ulster Y. C.:

Yacht Racing Association, Royal Victoria Y. C., Ryde, Isle of Wight, Aug. 13.—Proposed Challenge for the America Cup.—Sir: I have laid your letter of the 25th ult. before the Council at their meeting to-day, and the committee appointed by your club attended and explained the reasons for inviting the assistance of the Yacht Racing Association. The Council fully appreciate the courtesy of your club, but as the Yacht Racing Association have no jurisdiction in international racing, the Council decline to express an opinion on the proposed challenge.

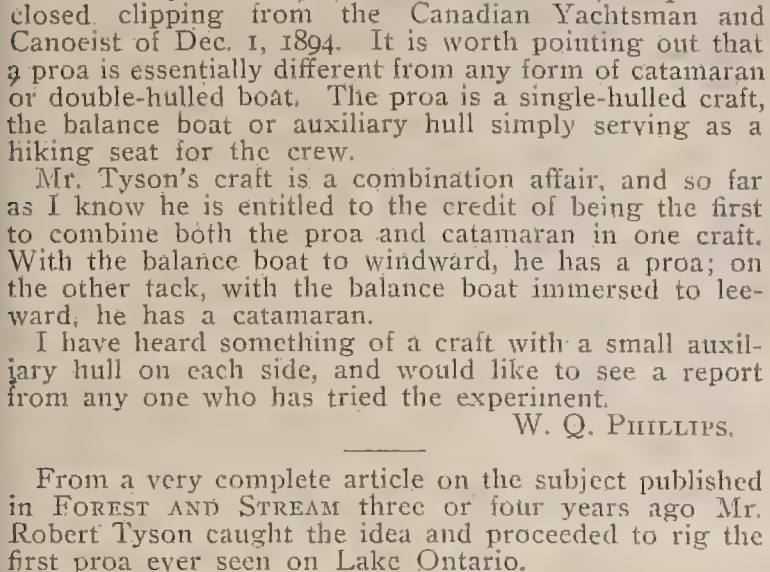
Your obedient servant,

SECRETARY, Yacht Racing Association.

To the secretary, Royal Ulster Y. C., Bangor, Ireland.

A Modern Proa.

CLINTON, Ont., Aug. 19.—*Editor Forest and Stream:* The correspondence regarding flying proas has reminded me of some notes I made on the subject in connection with Mr. Tyson's experiments at Toronto, as per inclosed clipping from the Canadian Yachtsman and Canoeist of Dec. 1, 1894. It is worth pointing out that a proa is essentially different from any form of catamaran or double-hulled boat. The proa is a single-hulled craft, the balance boat or auxiliary hull simply serving as a hiking seat for the crew.



Mr. Tyson's craft is a combination affair, and so far as I know he is entitled to the credit of being the first to combine both the proa and catamaran in one craft. With the balance boat to windward, he has a proa; on the other tack, with the balance boat immersed to leeward, he has a catamaran.

I have heard something of a craft with a small auxiliary hull on each side, and would like to see a report from any one who has tried the experiment.

W. Q. PHILLIPS.

From a very complete article on the subject published in FOREST AND STREAM three or four years ago Mr. Robert Tyson caught the idea and proceeded to rig the first proa ever seen on Lake Ontario.

Those who are posted on the history of the American Canoe Association will at once recall the name of Mr. Tyson as that of one of the charter members, and in the earlier days of the Toronto C. C. he was foremost of the most enthusiastic cruising men. Although less prominent of late years, he has steadily adhered to his favorite sport, every season finding him out early and late, sailing and paddling, and rigging and cooking, or tinkering away at some of the never-ending odd jobs which are the delight of the school of cruising canoemen—a class which is unfortunately not so well represented as it once was. In the course of his experience Mr. Tyson came to the same conclusion as many others—that a canoe was

not powerful enough for general work in such open waters as Lake Ontario—and cast about for some method of improvement. He was satisfied with canoe methods as regards accommodations, using either a shore or canoe tent as circumstances decided, but was anxious to secure more stability and power without sacrificing the lightness of hull and small displacement which made the craft paddleable and gave facilities for beaching and camping out and the regular housing of the craft when not in use. As an experiment he fitted a balance boat to his decked sailing canoe. The result was so satisfactory that he built the present proa, of which the cuts give a good idea.

The large gain in stability due to the auxiliary hull led Mr. Tyson to adopt the very small beam of 27in. in the main hull, coupled with a length of 17ft., but good depth, as shown in the section. This gave a compact form with much stowage and accommodation, capable of great speed under sail and easily driven by the paddle. The balance boat is always carried to starboard, supported by arms of springy elm, the length of which has been gradually increased until they now measure 10ft. The effect of this arrangement is easily understood. With the balance boat to leeward the effect of heeling is to immerse it, which results in some of the buoyancy of the main hull being shifted 10ft. outboard, the effect on the general center of buoyancy (C.B.) being to place it at a point between the two hulls, and distant from each inversely as its immersed bulk. The general center of gravity (C.G.) remains stationary or shifts in the opposite direction if the crew sit up to windward, and thus is established a long righting arm between the two centers, much longer than could take place in a single-hulled craft with only a narrow easily driven form to propel. On the other tack, with the balance boat to windward, the shift to the C.B. is of course very restricted, but the weight of the balance boat so far outboard makes it very effective shifting ballast, added to which the crew hike clear outside the main hull, sitting on a platform placed as far out on the arms as will enable them to still work the ship, the combined effect being a very large windward shift to the C.G. equal in extent and effect to the shift of the C.B. on the other tack. It is evident that the greater the displacement of the balance boat in proportion to that of the main hull, the greater the shift to the C. B., and the consequent stability when the balance boat becomes immersed to leeward—always supposing that the latter possesses plenty of surplus buoyancy, as what little immersion is due to its own weight cannot affect the main hull at all. On the other hand, a heavy balance boat is more effective when carried to windward. To obtain the same effect on either tack it should weigh exactly half of its own bulk of water.

But it is not necessary that this or any other definite proportion should be insisted on. In practice a decidedly light balance boat is preferable, giving great power when to leeward, and when carried to windward the same amount of stability is made up by the crew hiking clear outside, as already explained.

Although the above described proa has given decided satisfaction, Mr. Tyson is by no means committed to the exact proportions of any part, and may try a little more beam in the main hull next time. As it is, an awkward state of affairs would result in the remote possibility of the balance boat breaking loose, as the main hull, with its sharp floor and small beam, will not stand up alone. Nothing of the sort has ever happened, nor is it likely to, so long as the simple connections required between the two hulls are well looked after. But a little more stability in the main hull is decidedly worth having, and it need not interfere with general performance. The deep form shown has been found quite weatherly without a centerboard, the immersed balance boat also helping to prevent leeway. But concerning the question of model there is room for much experiment, and in the meantime one of the best features of the balance boat idea is that it can be fitted at small expense and trouble to any narrow skiff or canoe, at once producing a stiff and handy little sailing craft, which need lose scarcely any of its original convenient features. As the merits of the outfit become known, some cruisers will no doubt find the proa idea well suited to their needs. For a man who wants to house his craft in a boat house, and to haul it up on shore readily when cruising, it is just the thing, affording something of good working stability, combined with no more beam or displacement than is absolutely necessary to accommodate the crew and their dunnage and duffle; and requiring only a small and handy rig. On the craft illustrated Mr. Tyson has used a canoe rig of batswing main and mizen, and last season he added a jib. The rig was found very satisfactory, as indeed it would be for any small cruiser, and so far as proas are concerned, the same considerations govern the choice of rig as in other craft intended for similar uses.

The sailing canoe, with its original balance boat and fittings, upon which Mr. Tyson first experimented, now belongs to Mr. Felix Belcher, another enthusiastic cruising man of the right stamp, and he gets excellent sport and satisfaction with it.

Main Hull.

L.O.A. and L.W.L.	17ft.
Beam	2ft. 3in.
Depth of hull	1ft. 6in.
Depth of box keel	6in.
Width of box keel—about	4in.
Outriggers (over all)	10ft.

Balance Boat.

L.O.A. and L.W.L.	9ft. 9in.
Depth	17in.
Beam	9 or 10in.

The positions and proportions of the others parts can be obtained from the drawings, which are to scale. The beam of the main hull is carried pretty well fore and aft, and the bilge is very deep, the sides of the hull being almost parallel.

[Mr. Tyson has since built several improved craft of this type, and is now sailing one.]

The America Cup.

ON Sept. 2 the representatives of the Royal Ulster Y. C., Vice-Com. R. G. Sharman-Crawford, Hon. Sec'y Hugh C. Kelly, Hugh M. McGildowny and Wm. Fife, Jr., arrived in New York on the Britannic. On the following day, in company with the Hon. Charles Russell, they met the special committee of the New York Y. C. at the club house, Com. J. P. Morgan, Sec'y Oddie, Treas. Hurst, Messrs. H. B. Duryea and E. M. Brown. After a conference it was announced that the following informal challenge had been tendered and accepted:

"New York, Sept. 3.—J. V. S. Oddie, Esq., Secretary New York Y. C., 67 Madison avenue, New York.—Dear Sir: We have the honor, on behalf of the Royal Ulster Y. C., and in the name of Sir Thomas Lipton, a member of the club, to challenge to sail a series of matches with the yacht Shamrock against any one yacht or vessel constructed in the United States of America for the America's Cup, subject to the deed of gift and subject to conditions to be agreed upon.

"The following are the particulars of the challenging vessel: Owner, Sir Thomas Lipton; name of yacht, Shamrock; length of load water line, 89.5ft.; rig, cutter.

"The Custom House measurement will follow as soon as possible. We shall be much obliged if you will acknowledge receipt of this challenge. Yours truly,

"R. G. Sharman-Crawford, V. C., R. U. Y. C.
"Hugh M. McGildowny.
"Hugh C. Kelly, Hon. Sec'y, R. U. Y. C."

Another meeting was arranged for Tuesday to discuss dates, courses and secondary details.

Quincy Y. C. Challenge Cup.

THE final race for the Quincy Y. C. challenge cup was sailed on Sept. 1, resulting in a win for Recruit, the defending boat. The wind was N.E. and very light, the course being laid out to windward, with Seal Rocks as the turning point. Duchess set a topsail, which helped her in the light air. The race was to start at 10:30, but it was delayed for an hour waiting for wind. There was enough at the start to induce Duchess to stow her topsail. She crossed first, but Recruit had the better position and more way on, and with the weather berth soon took the lead. Duchess held her own very well on the wind, and they were timed:

Recruit .....12 07 17 Duchess 12 07 34

Duchess carried her topsail down wind, the first round was timed:

Recruit .....12 31 02 Duchess 12 31 50

There was more wind on the second round, and Recruit made a big gain, the times at the windward mark being:

Recruit .....1 02 20 Duchess 1 06 03

Duchess carried topsail and balloon jib in addition to spinaker on the run home, but she was unable to catch Recruit, the final times being:

	Finish.	Elapsed.
Recruit	1 25 04	1 55 04
Duchess	1 27 39	1 57 39

In order to give a chance to the schooner Bird, Mr. S. D. Small, the Quincy Y. C. has offered a $50 cup for a race between Recruit and Bird, also open to Duchess.

Indian Harbor Y. C.

Greenwich—Long Island Sound.
Saturday, Sept. 3.

THE Indian Harbor Y. C. sailed its autumn race on Sept. 3 in the hottest of hot weather and a light and fluky breeze. But one round of the course was sailed, the result being as follows:

Yawls—Start 2:35.

	R.M.	Finish.	Elapsed.
Consuelo, A. W. Cabot	29.00	7 00 00	4 25 00
Cutters and Sloops, 36ft. Class—Start 2:35.			
Vorant II., G. G. Tyson	34.00	5 36 32	3 01 32
Adele, J. B. Smith	34.00	6 00 50	3 25 50
Sloops, 20ft. Class—Start 2:40.			
Asthore, F. B. Jones	20.00	5 02 16	2 22 16
Ripple, J. A. Meek	17.00	5 46 13	3 06 13
Cabin Catboats—Start 2:50.			
Uarda, H. H. Gordon	24.64	5 02 54	2 17 54
Presto, H. S. Hatfield	22.00	Withdrew.	
Racing Knockabouts—Start 2:50.			
Mongoose, Simeon Ford	21.00	5 16 35	2 26 35
Mariposa, W. H. McCord	21.00	Did not finish.	
One-design Knockabouts—Start 2:50.			
Lucille, Daniel Bacon	21.00	5 00 06	2 10 06
Senta, Daniel Bacon	21.00	5 01 59	2 11 59
Midge, F. W. Boyer	21.00	5 02 38	2 12 38
Wyntje, F. S. Hastings	21.00	5 05 03	2 15 03
Ditto, H. S. Redmond	21.00	Did not finish.	
Dories—Start 2:55.			
Ketch II., L. C. Ketchum		4 26 28	1 31 28
Fiddler, E. Dominick		5 12 36	2 17 36
Black Cat, C. H. Dayton		Did not finish.	

The Seawanhaka Cup.

A SPECIAL meeting of the Seawanhaka C. Y. C. was held at Oyster Bay on Sept. 3, Com. Rouse presiding, the meeting being called to receive the report of the race committee on the recent races for the Seawanhaka international challenge cup. The report of the race committee was read, also reports from Messrs. Crane and Gibson. There was also read a letter from Messrs. Dresser and Kerr to the Royal St. Lawrence Y. C. stating that in sending to Mr. Crane the telegram already published they were acting solely as individuals, and did not presume to speak for the Seawanhaka Corinthian Y. C. The race committee report in brief expressed the opinion that Dominion was of a type not considered when the conditions were originally framed, and that she is not properly eligible to the races for the cup; also that the Royal St. Lawrence Y. C. was at liberty under the terms of trust to frame new conditions. The various reports in full will probably be made public later.

The report of the race committee was adopted.

On Sept. 2 a special meeting of the Royal St. Lawrence Y. C. was held at Dorval, at which it was resolved to return the cup to the Seawanhaka C. Y. C.

Canoeing.

American Canoe Association.

Nineteenth Annual Meet.

THE pressure of important yacht races for the past two weeks has made it necessary to defer the account of the continuation of the A. C. A. meet, which ended on Aug. 19. The complete record of the races is here given. The results show very little change from the preceding two or three years, and no improvement. The sailing trophy race brought out nothing up to the standard of Mab, and she covered the course half an hour ahead of her competitors, but she was disqualified for starting before the gun and not recrossing. The trophy goes to the New York C. C., through the patience and persistency of Mr. Smythe in sailing out the race to a finish, though a long way astern. The paddling trophy brought out a new man, Mr. H. C. Allen, of Trenton, N. J., Park Island C. A., a cruising canoeist with a good record of actual cruising. Apart from the new open canoes, the meet developed nothing new in boats or canoeing appliances.

The meet proved a pleasant and sociable one, greatly enjoyed by all who attended; the location was sufficiently isolated to prevent the overrunning of the camp by tourists. The quiet little town of Gananoque was at a convenient distance for an afternoon paddle, and canoes and other boats went back and forth constantly, but the townspeople were all more or less used to camping and picnicking, and were always welcome in camp. The incidents varied very little from those of former years, the one exception being the miniature hurricane of Aug. 15. Very elaborate plans had been made for the A. C. A. circus, under the direction of Mr. Seavey. A large tent was erected, talent was gathered from the members in camp, a band was brought from Gananoque, and quite elaborate preparations were made. Early in the evening a number of visitors came from Gananoque and other places among the islands. Just as the tent was well filled a violent storm broke over the camp, with little warning, blowing down the circus and other tents. For a few minutes matters looked very serious, as many people were under the tent, and some of the fittings took fire from the lamps, but all were rescued without injury and given shelter in the headquarter tents and such other places as were available. Much minor damage was done to the mess tent and private tents, and the circus was wrecked for the time being. Everything was repaired, however, under the energetic management of Mr. Seavey, and the performance took place on the following Thursday, to the amusement of a large audience.

The meeting of the executive committee was set for Aug. 13, but as the Eastern Division, whose turn it was to take the commodoreship and the meet in 1899, was not prepared to offer nominees for commodore and secretary-treasurer, the meeting was adjourned to Aug. —. The Eastern Division being unwilling to accept its turn, the Central Division came next in order, and F. S. Thorn, of the Buffalo C. C., was elected commodore, and C. P. Forbush, of the same club, secretary-treasurer.

The annual meeting of the Atlantic Division was held on Aug. 13, the officers elected being: Vice-Commodore, F. C. Moore; Rear-Commodore, H. C. Allen; Pur-

ser, J. C. Mowbray; Ex-Commodores, W. C. Lawrence, Nathaniel Hyatt. The annual meeting of the Central Division was held on Aug. 14, the following officers being elected: Vice-Commodore, C. P. Forbush; Rear-Commodore, L. C. Woodworth; Purser, C. H. Williams; Executive Committee, W. R. Huntington, of Rome; F. G. Mather, of Albany, and H. C. Morse, of Peoria, Ill.

The camp will be remembered as one of the most picturesque in itself of any yet held, the accompanying photos show a couple of pretty bits. The excellent rearrangement of the ground removed many of the objections to the site, and helped to make the camp a pleasant one socially, the headquarters being in the center and easily accessible from all points.

1899.

April 11-13.—Elkwood Park, Long Branch, N. J.—The Interstate Association's seventh annual Grand American Handicap tournament.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The Mount Kisco Rod and Gun Club, Mount Kisco, N. Y., will hold a live-bird handicap, two events, on Sept. 22. The first event will be at 7 live birds, $5 entrance; the second at 10 live birds, $10 entrance; the handicaps from 25 to 32yds. Entries close Sept. 20, at 8 P. M. All those who desire to enter one or both of these events can make arrangements by communicating with Mr. G. E. Sutton, care of the Mount Kisco Rod and Gun Club, before the time of closing. If there are over twelve entries the purse will be divided into four moneys. Shooting begins at 10:30 sharp. Messrs. Otis Arnold, of the Pawling Rod and Gun Club; Frank Fowler, of the Mount Kisco Rod and Gun Club, and B. Waters have been appointed handicap committee. Extra events at targets will be shot if time permits. Mount Kisco is 37 miles from New York. The grounds are attractively situated and the shoots are very congenial contests. In arranging this live-bird handicap, there is no effort to make money out of it. Sport dominates all other interests. Those who intend to participate should enter early, so that the managers can make their arrangements for birds, etc.

A target and live-bird tournament will be given by members of the Altoona Rod and Gun Club, at Wopsononock Park, Altoona, Pa., Sept. 30 and Oct. 1. There are ten target events on the first day, 125 targets, with a total entrance of $12.50, and one event 15 live birds, $8 entrance. The second day's programme has ten target events, one at 50 singles for the championship of Blair, Cambria, Bedford and Huntington counties, entrance $3.50. The total programme targets for the day number 155, with a total entrance of $14. The Jack Rabbit system, class shooting, high guns, are used, the former mostly. To reach the grounds take street cars (one square from depot) to Juniata Station; then P., J. & E. R. R. to Wopsononock. There is a good hotel on the grounds. Altoona headquarters will be at the Brant House. Live-bird events will be shot on the second day if the shooters so desire. Those who enter in all target events will be given free target entrance in the championship event. U. S. Houk, W. S. Bookwalter and G. G. Zeth, committee.

Under date of Sept. 2 Mr. John Parker writes: "On account of my prolonged business trip South, the annual State shoot of the Michigan State Trap-Shooters' League has been again postponed until Sept. 20, 21, 22 and 23. The first two days will be State shoot days, open only to residents of State. Second two days will be open to amateurs only, manufacturers' agents allowed to shoot for targets only. There will be open events each day during State shoot, and a set of extra traps will be on hand for non-residents of State to shoot sweepstakes. During the first two days the State League trophies will be shot for. Cash prizes, trophies, fishing rods and merchandise will be offered as prizes. I have given up my annual shoot this year on account of this shoot."

Mr. C. W. Budd, of Des Moines, Ia., writes us as follows under date of Aug. 31: "The Iowa State Sportsmen's Association will hold their annual convention and tournament at Des Moines, Ia., Oct. 4, 5 and 6. This tournament will be open to all, with the exception of two State events. The purses with added money will be divided by the four-money equitable system that gave good satisfaction at the Minneapolis tournament. Three handsome cups will be given to the three classes, as follows: 70, 80 and 90. Those shooting through the programme and placing themselves in either the above classes will shoot off for the final ownership of the cup in their class. Contest to be at 50 targets, entrance price of targets only."

On Sept. 14, at Cable's Hotel, Midland Beach, Staten Island, a live-bird handicap will be held under the auspices of the Staten Island Lacrosse and Athletic Association. Two events are on the programme, one at 25 birds, $10 entrance, birds extra, with cup to first besides first money. The other at 10 birds, $2, the prize being a cup. A clambake will be a feature. Shooting commences at 11 o'clock.

The Boiling Springs Gun Club, of Rutherford, N. J., will hold a handicap shoot at 100 targets, Sept. 24, at 1 o'clock. Targets will be thrown Sergeant system. Entrance $5. Targets deducted from purse at 1½ cents. Money divided according to the Rose system.

The members of the Marshall Rod and Gun Club, Marshall, Ill., at a recent meeting elected officers as follows: President, D. D. Doll; Secretary, S. Handy; Treasurer, H. B. Dulaney; Manager, W. Harlan; Assistant Manager, V. L. Cole.

Mr. J. B. Barto and Dr. S. Shaw, Chicago, have challenged Mr. T. B. Hicks to shoot a match for the Chicago live-bird challenge trophy. Uneasy rests the head which wears a trophy these warm days.

The second annual tournament of the Mt. Shasta Gun Club, of Redding, at live birds and targets, will be held at Redding, Cal., Sept. 9. A grand ball will conclude the event.

The next shoot of the Philadelphia Trap-Shooters' League will be held on the grounds of the Washington Gun Club, Conshohocken, Pa., Sept. 24.

The Mt. Sterling Gun Club, of Mt. Sterling, Ill., will hold a two days' tournament, Oct. 11 and 12. J. Breidenbend, Secretary.

The regular monthly cup shoot of the Brooklyn Gun Club will take place on Saturday of this week.

BERNARD WATERS.

Hingham Gun Club.

HINGHAM, Mass., Aug. 27.—The Hingham Gun Club held a 100-target handicap match on the grounds Saturday, Aug. 27. The day was perfect for trap-shooting, although the birds were of the tricky kind, some fast, some slow, some high and some low. Leroy, with his Remington and Du Pont powder, landed in first average for the day with .933 per cent. Dickey, shooting a Parker gun and E. C., was second with .902. Dickey's shooting in the 100-target match was wonderful, as he scored 97, and the birds were not thrown for records either. Leroy was his nearest competitor, with 93.

The totals in the 100-bird match: Dickey 97, Henderson 91 plus 3—94, Leroy 93, Allison 91, Jones 82, Howe 81, Herbert 81, Waldo 73, Bowker 70.

Following are the scores:

Events:	1	2	3	4	5	6	7	8	9	
Targets:	10	15	10	10	15	100	10	15	10	Broke.
Henderson	8	11	9	8	14	91	9	14	10	174

IN NEW JERSEY.

NEW UTRECHT GUN CLUB.

Woodlawn, Brooklyn, Sept. 5.—There was a light attendance at the Labor Day shoot of the New Utrecht Gun Club, particularly when it was a cup event. Messrs. F. Thompson and G. Piercy were the only club contestants. The former won the Holiday cup on a score of 10 to 9, and this being his third win the cup now becomes his personal property.

The birds were a fairly good lot of summer birds, and had there been any wind they would have been much harder than they were. Six miss-and-out events, $1 entrance, birds extra, were shot. After the first miss-and-out each shooter went back 1yd. after each round. Two 5-bird events, Nos. 8 and 9, $2 entrance, birds included, were shot. The scores:

F Thompson.....1212121212—10 L Piercy .....2211221221—10
G Piercy.....2202222222— 9

Miss-and-outs, $1, after No. 1 each shooter went back 1yd. after each round:

BOILING SPRINGS GUN CLUB.

Rutherford, N. J., Sept. 3.—There was a light attendance at the monthly shoot of the Boiling Springs Gun Club to-day. The weather was so hot and sultry that exertion was almost painful. Following are the scores of the club shoot, 50 targets, handicap, Mr. Platt Adams winning on a score of 48:

Banks, 2 .....1101110111111111111110111—22

Trap Around Reading.

READING, Pa., Sept. 3.—An interesting shoot was held this afternoon by the South End Gun Club, on its grounds on Fritz Island. It was the regular Labor Day shoot, but was transferred to to-day so as to allow the members a chance to compete for the club medals, and then shoot at the merchandise shoot on Labor Day at the Mt. Penn Club's shoot. Geo. Miller won the Class A medal, hitting 23 out of 25; Jas. Gicker again won the Class B medal—the third time—hitting 21 out of 25; Jas. Grossman had no competitor in Class C, and thus retains the silver medal. The hot weather kept some of the shooters away, and those that did shoot did not last long, as it was 99° in the shade at 3 P. M. at the club house. Sweeps followed until near 5 P. M. Referee was Frank Gorman, Wm. D. Butler officiating as scorer.

The team for the Mt. Penn trophy shoot was picked and expects to win it.

Aug. 29.—The eleventh annual meeting of the South End Gun Club was held at the residence of Peter Texter, when the following were elected for the ensuing year: President, Chas. Miles; Vice-President, Joseph Downs; Secretary, Peter Texter; Assistant Secretary, W. W. Essick; Treasurer, Martin Eshelman; Trustees: Francis Yost, Frank Gerhart, Geo. Ganster; Captain, Francis Yost; Assistant Captain, Geo. Miller.

The statement of the year showed the finances of the club to be in excellent shape, with a limited membership of thirty.

It was decided to send a picked team of five men to compete for the intercounty trophy at the Mt. Penn Gun Club's shoot Sept. 5. The South End Gun Club, besides owning the grounds known as Fritz Island, also owns a fine tract of ground and club house for fishing and camping along the Susquehanna River, above Columbia, Pa. This club is considered to be one of the best financial clubs known of in the eastern part of the United States, and is always on the lookout for new improvements to traps and other implements which make a fine shooting grounds.

Pottstown, Pa., Sept. 3.—Members of the Shuler Shooting Club held an interesting target match here to-day. Good scores were made by the members. The club decided upon Capt. C. H. Wickersham, H. W. Benner, W. D. Sheuler, Harry Trumbauer and Livingstone Saylor to represent the Shuler Club in the intercounty trophy shoot at Reading, Sept. 5.

Pottsville, Pa., Aug. 31.—A shooting match at New Philadelphia, near here, attracted a large crowd. A. E. Shappell, of Pottsville, was the winner. There were five contestants, each man shooting at 12 birds. The scores were as follows: A. E. Shappell 10, A. Landis 8, L. Martz 6, L. Clausman 5, P. McQuaid 7.

Reading, Pa., Sept. 3.—Charles Fritz and Harry Breneiser shot a live-bird match on Schwartz's Farm, near here, this afternoon. Each man shot at 10 live pigeons. Breneiser killed 9 to Fritz's 8. trophy shoot at Reading, Sept. 5.

DUSTER.

Woonsocket Gun Club.

TEN of the members of the club participated and there were eleven visitors. The latter included Messrs. Griffith, Slade and Fairbrother, of Pascoag; Root and Bain, of Providence; Reiner, of Centerdale; Day, Rawson, Ford and Coffin, of Uxbridge, and E. L. Walling, of this city. The club members who competed were Messrs. Mills, Campbell, Getchell, Allen, Banfill, Barber, Balcome, Daniels, Fisher and Darling.

Thirteen events were shot at a 16yd. rise, both known and unknown angles. Several straight scores were made, and the prizes were divided according to the Rose system. H. D. Barber, of the club, made the longest run of 30 shots, and M. H. Coffin, of Uxbridge, was next, with a 27-shot run. The merchandise event was made a sweepstakes.

The competition for the trophy shooting will close Sept. 24.

No. 9 was at 5 pairs; No. 10 was miss-and-out:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13

The Chicago Times-Herald, in its report of the Heikes-Gilbert match for the cast iron pearl, states that "The cast iron medal is a trophy held by Dr. Carver for a number of years." Carver must have been in his unusual good form to hold it so long. It is "important if true."

WESTERN TRAPS.

THE CHICAGO TROPHIES.

CHICAGO, Ill., Sept. 3.—That the new Chicago trophy, the Montgomery Ward handicap medal, is to continue its course of popularity and success may readily be seen by the report of the second shoot of the series, elsewhere shown.

Meantime the fated hoodoo trophy plunges along in the rear, sadly waterlogged. It is practically assured that a protest will be filed on the Hicks-Cunnyngham race, on the grounds that the handicap was not established in accordance with the rules. Of course, every shooter in Chicago knew that the handicap was wrong—as flagrantly wrong as it could be—but perhaps not all shooters knew just how this handicap was arranged. As a matter of fact, Mr. Mussey, chairman of the trustees, had nothing to do with the handicap, and never heard of it until after it was announced to the contestants. He declined to ratify it. This left Mr. Hicks, one of the contestants, and Mr. Shepard still on the committee, but Mr. Hicks of course could not pass on his own handicap, and Mr. Shepard could not decide it, as that would not constitute a majority of the trustees. The protest will of course be valid, but it brings up the curious question: To whom shall the protest be made? Mr. Shepard could not back his own action, and Mr. Hicks could not serve, so that it would be a tie between Mr. Mussey and Mr. Shepard. Obviously the only sportsmanlike thing to do, if one of the trusteees wishes to shoot for this trophy, is to resign his position as trustee and go after it as a shooter only. There is no hardship in that, and it would save a lot of talk of unnecessary and unpleasant nature, such as is now common about this matter. The whole thing has been disgusting and unsportsmanlike from its inception, as has often been said, barring the sportsmanlike shooting at the score, and it would be difficult to devise a trophy which should get itself into more trouble in the same time than this one, born into the world with the worst case of string-halt that has ever come before the notice of the public.

BLOOMINGTON GUN CLUB.

The new gun club of Bloomington, Ill., known as the Bloomington Gun Club, starts off at a very hot gait, and seems bound to be a popular and useful body of shooters in that good shooting town. At the first shoot, last week, a good little crowd was on hand and had sport at targets and birds. In the club contest, 50 targets, Mr. Clark Gideon was first with a clean string.

E. HOUGH.

1200 BOYCE BUILDING, Chicago, Ill.

CHICAGO, Aug. 31.—The Eureka Gun Club, of Chicago, have this day challenged the Garfield Gun Club to contest for the possession of the Shooting and Fishing trophy, now held by that club. The trophy was originally won by the Eurekas in July, 1893, and they successfully defended the same until won by the Douglas Gun Club in 1896. The Garfields soon after won over the Douglas, and are now the holders.

THE MONTGOMERY WARD TROPHY.

The contest for the Montgomery Ward trophy was held at Watson's Park, Sept. 2, commencing in the forenoon and lasting until dark. There were thirty-two entries. The race was at 20 live birds, with handicap of distance and birds allowed by the referee and handicapper, John Watson. All of the contestants seemed perfectly satisfied with his judgment.

The birds were an excellent lot during the greater part of the day. There was a driving wind from the right quarter, with a bright light, which continued well into the afternoon.

The notable feature of the day was the shooting of Miss Edith Porter, who is secretary of the Stony Island Gun Club. She entered the race for the trophy with a handicap of 26yds. and 6 birds, and scored 20, not using her entire handicap of birds. Six tied for first—J. B. Barto, Silas Palmer, H. B. Foss, E. M. Steck, P. D. Norcom and Miss Porter.

Darkness came, and the remainder agreed to shoot off the tie on Sept. 5 at 4 o'clock. The ties on 19 and 18 will be shot off at the next regular contest.

Scores, handicap of distance and extra birds are as follows:

F. Hollister, 28, 2	0212210112021202022O w	—14

Dr C W Carson, 28, 3	0221221101220111211012 2	—19

The shoot-off for the medal, 10 live birds with handicap, though the shooter having an odd bird, say of three, was allowed but one in the 10 birds, was as follows:

B Barto	2121211222	—10	E M Steck	2121122212	—10
S Palmer	202210 w	— 4	P D Norcom	0120 w	— 2
H B Foss	12222111022	—10	E Porter	0011111102111	—10

CHICAGO CHALLENGE TROPHY.

Under date of Sept. 2 Mr. Paterson protested the contest between Messrs. Hicks and Cunnyngham, held on Aug. 26, on the grounds that it was the duty of the committee or a majority of it to handicap the contestants, and that as two of the trustees, Messrs. Mussey and Hicks, took no part in the handicapping, but one of the trustees acted in the matter. It therefore was illegal, and Mr. Paterson therefore asks that it be declared no contest.

EUREKA GUN CLUB.

The Eureka Gun Club held its regular weekly target contest Sept. 3. All events were shot from the magautrap and from three traps under the Sergeant system.

Team shoot, 25 targets per man:

C. Antoine 16, V. Cunnyngham 19, W. R. Morgan 22, A. W. Adams 23, L. H. Goodrich 19, H. B. Morgan 16; total 115.

W. D. Stannard 24, F. P. Stannard 25, E. M. Steck 24, A. C. Paterson 25, J. S. Houston 22, Dr. H. Miller 20; total 140.

Team race, 25 targets:

V. Cunnyngham 19, C. Antoine 20, A. C. Paterson 17, A. W. Adams 22, J. S. Houston 22; total 100.

W. D. Stannard 24, F. P. Stannard 25, E. M Steck 24, W. R. Morgan 21, Dr. H. Miller 21; total 115.

Following are scores in the trophy contest. Class A won by Chas. Antoine; Class B won by V. L. Cunnyngham, and Class C by H. B. Morgan:

Class A—F. P. Stannard 19, J. S. Houston 16, A. W. Adams 21, W. R. Morgan 23, R. B. Miller 21, W. D. Stannard 23, Chas. Antoine 25, Ed. Steck 20, Paterson 19, Goodrich 19.

Class B—C. W. Carson 15, H. Vetter 16, V. Cunnyngham 23, R. B. Carson 9.

Class C—H. B. Morgan 22, Neta 9, Mrs. H. F. Carson 7, James 16.

GARFIELD GUN CLUB.

The Garfield Gun Club held its weekly target contest on Sept. 3, with a fairly good attendance:

Team shoot, 15 targets, known traps, unknown angles:

C. P. Richards 11, T. P. Hicks 14, H. Fehrman 13, S. M. Young 4, Dr. Meek 8, D. Russell 11, G. Brown 11; total 72.

R. Kuss 11, Dr. Shaw 11, C. Stieger 9, J. Workman 11, A. Hellman 13, Eaton 12, Nusley 8; total 75.

Following are scores in the trophy event of 25 targets, known traps, unknown angles, Classified. C. P. Richards won Class A on the shoot-off; Dr. Meek won Class B on the shoot-off, and J. Workman won Class C on shoot-off:

Workman 19, Nusley 13, Richards 23, Kuss 23, Fehrman 22, Brown 18, Shaw 20, De Maris 19, Hellman 17, Eaton 17, Hicks 18, Stiger 20, Meek 20, Young 19, Russell 18.

Philadelphia Trap-Shooters' League.

PHILADELPHIA, Aug. 27.—The grounds of the Silver Lake Gun Club, Point House Road, were the scene of the sixth monthly team match of the Philadelphia Trap-Shooters' League. Mr. Scheetz and Mr. Van Nort looked after the clerical duties.

Team match, 25 targets and handicap, known angles:

Confabulations of the Cadi.—III.

THE MYSTERY OF THE COCOANUT.

THE day had been so rainy that none of the woodpile court had put in an appearance excepting the two reliables, Moke and Ephraim, whose afternoon thirst and craving for wisdom always impelled them to brave heat or cold, calm or storm, to the end that they might enjoy the improving society of the Cadi. As night came, the rain fell so heavily that the good Cadi would not permit his friends to depart. They talked and talked and giggled and laughed to such a degree that Hopie Jane could not get in a word edgewise in the conversation, so she herded the children together early and led them all to the sweet balm of dreamland. As she left the room the Cadi remarked that a woman must talk or perish, and this notwithstanding that the men had been doing all the talking themselves. At midnight there was no cessation in the friendly communion.

"Speaking of cocoanuts," said the Cadi, "can you tell me the answer to that old, old problem which requires an explanation of how the milk is in the cocoanut?"

"As for me, I don't profess to know anything about a cocoanut," replied Moke. "I don't even know how it happened to be a cocoanut instead of a cucumber or a potato. I don't even know how there was a shell put on the outside purposely to hold the milk. Why was it put there, good Cadi?"

"One thing at a time, good friend," said the Cadi, with a serious air. "On these great speculative subjects none but the greatest minds should ponder. But, dropping the cocoanut for the present, I will give you a useful problem in arithmetic, which is more within your powers of thought, namely: Suppose that a fellow goes to a shoot with 100 cartridges, and before the shoot is over he shoots 200 cartridges, and doesn't buy any in the meantime—required the answer."

"See here, Cadi," said Moke, hotly, "I didn't come here to be insulted by you nor any one else. If you think that I steal cartridges at our shoots, and that that explains how the milk is in the cocoanut, be man enough to say so, and don't cast any cowardly insinuations. Speak out plainly. You are a bigger man than I am, but whether you are a better one or not we may have to try in a manner that is not speculative, and on which a very common mind may ponder. Stealing! The idea."

"You astonish and grieve me, Moke," replied the Cadi, kindly. "If you will again consider what I said, you will note that I did not say a single word about stealing. I was not thinking of such a thing. Don't make a mistake about the subject, Moke. I have first and last seen a few fellows who a few times came to a shoot with a few cartridges, and who shot a few more than they brought. Merely as a problem in arithmetic, a pure matter of figures, I wondered how they did it. I had no particular person in mind, good Moke. If you ever took any cartridges belonging to the other fellow, I am sure that it was through a mistake."

"Of course, of course! You're right, wise Cadi, and you are a true sportsman too, for the real sportsman is always properly euphemistic. I am quicker to notice some things too than is becoming to an innocent man. All shells look alike to me, and in my fits of abstraction I may have taken some now and then which did not belong to me; but I assure you it was done through a mistake. Some people who are a heap better than I am—in their minds—make mistakes too; isn't that so, Ephraim?"

"Let them as the coat fits wear it," replied that worthy, sententiously.

"Tut-tut! fie-fie!" said the peaceful Cadi. "You must not get personal over a simple question in arithmetic."

THE DIFFERENTIATION OF THE TWEEDLES.

There was a silence for a long while, each of the woodpile philosophers puffing away at his pipe, with no thought of the morrow. The good Cadi filled up the tin cups with cider, and after each one had modestly moistened his lips with about a pint the Cadi said without any preface: "The difference between tweedle dum and tweedle dee has been given a great deal of thought by philosophers, for it is a matter of infinite difficulty to make the proper equation. There are a great number of people, however, who can point out the tweedle dums of their neighbors who cannot see the tweedle dees of their own."

"F'rinstance," queried both listeners together.

"Well, referring to the remark which Moke made a moment ago concerning mistakes, there are different degrees of taking what does not belong to one. Let us consider but one feature of our club shoots, that embodied in the rule 'no bang, no bird.' The rule is not intended to give the shooter any privileges in refusing lawful targets. You know of course that it was framed to overlook real oversights or lapses on the part of the shooters, thereby making ordinary club shoots more pleasant and enjoyable to all concerned; for if the regular tournament rules were enforced on amateurs who are not thoroughly schooled in them, or the discipline made too rigid for all, it would detract greatly from the pleasure of our informal shoots, besides being unnecessary. Thus, when a shooter forgets to push up his safety, or to cock his gun, or to load it, or pulls the wrong trigger, or flinches or fudges, such mistakes or lapses are deemed to be excusable, as they are extraneous things in a way which balk the shooter. This rule, however, was never intended to tolerate the abuse which is sometimes permitted when a shooter takes a premeditated advantage of it in refusing targets which do not take the flight which he fancies. Such is not a lawful means to secure easy targets. I have seen shooters who would scorn to appropriate the other fellows' shells, yet who would not hesitate to refuse a target which they found difficult to negotiate, or one which had a flight which was difficult, perhaps artfully pretending that their safety was not pushed up, etc., or even cheekily refusing two or three targets in succession without any pretext whatever, till one came that was easy. Such tactics are a great advantage over the shooters who shoot fair, as they add more or less to the offending shooter's score in every event. Taking an unfair advantage and taking shells by mistake may have material results which are much alike, except that undeserved honors may be added to the former. Herein is where the tweedle dum and the tweedle dee come in. Fair play and no favor should be our motto. What do you say, Ephraim?"

"See here, Cadi," said Ephraim, turning very red, "you need not look at me in that kind of way. 'No bang, no bird,' means just what it says, and if I want to pick out an easy target now and then, I consider it my own business. What do you say, Moke?"

"I say, 'Let them as the coat fits wear it,'" and Moke chuckled as one who had canceled his obligations.

THE WONDERS OF MEMORY.

Thereafter the sage and illustrious Cadi and his friends sat in silence for a long time, as becometh philosophers, puffing away at their pipes, which were well filled with fragrant plug tobacco of the kind designed to give the greatest bulk for the smallest sum which was consistent with sales on credit. At length the Cadi gave a few vigorous puffs so that there might be a fiercer glow to keep the pipe going while he unwound a few pearls of wisdom, and without looking at any one he remarked: "Strange, isn't it?"

"Isn't it what?" queried Ephraim, who was preoccupied, calculating when the Cadi would refill the empty pitcher.

"I was thinking that the mystery of the milk in the cocoanut is a dry and uninteresting subject when compared with the wonders of the human mind. The mind is a wonder of wonders. A thought is sometimes as quick as lightning, or as slow as molasses in January, and this too all on one and the same subject. But that's a paradox, and there's only a few of us philosophers who understand a paradox, and some of us not very clearly at that," murmured the Cadi, as he proceeded to pull off his heavy boots, rubbing his feet and grinning painfully sidewise in the anguish which goes with corns and hot weather.

"I don't understand what you're talking about," said Moke, frankly.

"Perpend," said the Cadi. "Let me illustrate by an actual case between ourselves. I bet 10 cents with you in a sweep at the last club shoot before you amateurs barred me. Yes. Well, you beat me, and the last gun was hardly fired when you came a-running with open, outstretched hand, and demanded your 10 cents. Now, I don't care a picayune for the 10 cents, but I find it an excellent circumstance to illustrate how rapidly the human mind will act. Then in the next sweep we bet 10 cents again, and I won. Your mind ceased acting. I have since unavailingly given you many hints and expectant looks betimes, and there is where the simile to the molasses in January comes in. That quickness and that slowness I consider one of the wonders of the human mind."

"Here's your old dime," sputtered Moke, as he handed out the coin with an ill grace. "Take it, and I'll never make a bet with you again!"

"No, keep it, Moke," said the Cadi, graciously and kindly. "I was only considering the matter from the standpoint of philosophy, and besides you are my guest, all of which hold collections in strict abeyance."

Ephraim spoke up eagerly: "Give it to me, Moke, and then you and I will be square on our last shoot."

"I thought that you liked to shoot simply for sport and not for money," retorted Moke.

"So I do," Ephraim admitted.

"In that case the money doesn't make any difference to you, so I'll put it in my own pocket," and he suited the action to the word.

SWEET BELLS OUT OF TUNE.

The conversation was interrupted by a furious thumping on the wall, as the angry voice of Hopie Jane in the next room was heard in squeaky soprano calling, "Cadi! Cadi! will you ever stop that gabble, gabble about nothing with every vagabond that will sit up all night and listen to you? It's morning now, and us folks that work hard all day want to sleep, and them as don't work hain't so particular, and needn't to be. Go to bed. You hear my horn."

The two visitors looked hard at the Cadi, as if they expected him to assert his authority as lord of the castle and host to his guests, but the good and wise man only raised his forefinger, enjoining silence, then walked on tiptoe over to them, keeping his eyes apprehensively on the door meanwhile, he whispered: "We'd better go to bed right away. Keep quiet now!" he commanded.

Moke was disposed to be facetious, and was fixing his mouth to speak, when the Cadi put one hand over it firmly, took him by the collar with the other and led him out of doors. Returning for the lamp, he showed them to a cabin which he called the lodge, and which was some yards from the house. Once inside the lodge, and the danger being past, the Cadi breathed freer. Intending now to be a bit malicious under the guise of jesting, Moke said: "Cadi, are you afraid of Hopie Jane?"

"Discretion is sometimes mistaken for fear, good Moke," replied the Cadi. "Women are curious critters. When Hopie Jane once gets started she begins away back at the first grievance she ever had against me and enumerates them all from A to Z, everyone with a damaging inference or accusation, and yet Hopie Jane is the sweetest little woman in the world, and makes a living for me as few women could; but she has spells now and then when her tongue gets a-running like an eight-day clock, and it only stops when it's run down. You never would dream what a villain I am till beloved Hopie Jane tells a million or two of particulars. It's marvellous too what a memory that woman has in respect to her wrongs. Even when we are peaceful and happy for weeks she is secretly keeping tab on me, putting an ill construction on things which she does not understand, and, when it comes to a time that she is angry, she goes over the old list, which I have heard a thousand times, then in due time she adds a hundred more new particulars of which I never had the least knowledge. Then she weeps and pities herself for an hour, then finishes by telling me that she didn't mean a word of it, and that I am a silly old thing to take any notice of it at all—so you will understand why discretion and good sense so often go together in keeping under cover when the storm threatens."

"That's about the way my wife treats me, only the description could be made a little stronger on some points," said Ephraim, soberly.

"Mine too," said Moke.

"I presume that all wives are much alike," said the good Cadi. "Good night."

"Good night," his guests responded.

The door had hardly closed on the disappearing form of the Cadi when a loud whack was heard, as if the good man had received a blow across his back with a pine board. Immediately the angry voice of Hopie Jane was heard in angry, high tones, saying, "All wives are alike, hey!"—whack-whack—"eight-day clock, hey!"—whack—"discretion and good sense, hey!"—whack—"I'll show you how the milk got into the cocoanut!"—whack-whack—"and the difference between tweedle dee and tweedle dum!"—whack, whack, whack—and the door slammed as they entered the house, after which there was a confused sound of scolding and pleading for a few minutes, till the children commenced bawling in concert, whereupon the greater noise drowned the lesser.

"I fear that our good friend timed his discretion a little too late for the best results," said Moke, seriously.

"However that may be, I have come to believe in the last few minutes that all wives are not exactly alike," ventured Ephraim.

"Wives be hanged," said Moke, gruffly. "Whether we will find the Cadi alive or dead in the morning is what worries me. The best that we can expect is that he had only an arm knocked off, or had his back stove in. In any case, it's time to stop talking," and then they laid themselves down on the downy corncob bed to sour and broken slumbers.

BERNARD WATERS.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, SEPTEMBER 17, 1898.

VOL. LI.—No. 12. No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, $4 per year, $2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

In hunting, the finding and killing of the game is after all but a part of the whole. The free, self-reliant, adventurous life, with its rugged and stalwart democracy; the wild surroundings, the grand beauty of the scenery, the chance to study the ways and habits of the woodland creatures—all these unite to give the career of the wilderness hunter its peculiar charm. The chase is among the best of all national pastimes; it cultivates that vigorous manliness for the lack of which in a nation, as in an individual, the possession of no other qualities can possibly atone.

Theodore Roosevelt.

OUR FOREST INTERESTS.

THE year 1898 seems to have marked the turn of the tide in forestry matters in America. After a long, hard struggle the Federal Legislature finally confirmed the various forest reservations set aside by President Cleveland in accordance with the report made by the special committee nominated by the National Academy of Sciences. Further than this, no less than $285,000 were appropriated by Congress for forestry and cognate purposes, an amount far in excess of what had been expected or even asked for by those most deeply interested in this subject. Besides this, the Legislature of the State of New York, after having for many years neglected the forests of the Adirondack region, established this year the New York State College of Forestry "for the purpose of education and instruction in the principles and practices of scientific forestry." Provision was made in the same act to establish a demonstration forest of not more than 30,000 acres in the Adirondacks, which should become the property of Cornell University for the term of thirty years, and should be used for demonstrations of practical forestry. The sum of $10,000 was appropriated for the organization and maintenance of the college and demonstration forest, and the Commission of Fisheries, Game and Forests was ordered to furnish the necessary guards to protect the property.

All these developments have given to the science of forestry a standing which hitherto it has never had in America. They cannot fail to arrest public attention; and it is very certain that before long the example of the Empire State will be followed by other States, and that the fact that forestry is worthy of attention will impress itself not only on the various States, but on the public at large. Thus we may hope that the United States will no longer lag far behind the nations of the old world in a matter of such great economic importance as this.

If left to itself, every soil where there is sufficient moisture naturally produces some wood crop, and it is for the forester by his skill and his intelligent direction so to use the natural factors of production that the largest amount of serviceable material may be produced in the shortest time.

Two purposes of special importance are served by forestry. The one is that of producing from soil otherwise useless wood crops which will yield a revenue, the other that of so treating mountains and hillsides as to protect them from being denuded of their soil, and thus rendered so barren that trees will not grow upon them nor water linger on their slopes. It is estimated that the annual consumption of wood materials in the United States is not less than 20,000,000,000 cubic feet, and that its value is not less than $1,000,000,000. Hitherto practically all of this wood has been derived from the forests of the country, while no attention has been given to the reproduction, and little or none to protection of standing forests from fire and other destructive agents. Evidently, therefore, the time has come for protection. The uses of forest and undergrowth in protecting and keeping in place the soil and forest floor, and thus controlling and retaining the water supply for the heads of streams, has been gone over so frequently as to need no more than a reference.

The New York State College of Forestry is to be administered by the trustees of Cornell University, and it is fortunate in being connected with so important an institution of learning, for the connection is obviously very favorable to the students of the forestry college. It is obvious that an institution such as this will supply what it has never hitherto been possible to obtain in this country, namely the special training, without which no man can intelligently work at this difficult subject. Hitherto the young man who desired to equip himself in the art of forestry was obliged to spend years of study in Europe before he could fit himself for forest work.

The establishment by the Federal Government of a forest service, which we may fairly hope will become more and more efficient as the years go on, will furnish employment for the graduates of this New York State College, who in turn will give to the Government which employes them the benefit of their careful training and their special knowledge. It may be imagined that a time will come when all the appointees in the forest service, whether of State or general Government, will be men known for their special ability and acquirements in forestry, not for their services in State or Federal politics, or for the pull which they may have with Senators or Representatives. To imagine such a condition of things in the United States may appear a little bit like looking forward to the coming of the millennium, but this is the thing which ought to be and which we believe will be.

NETS AND NET BOUNTIES.

THE task of preventing illegal netting in inland waters presents one of the most perplexing problems in fish protection. Laws prohibiting the practice are enacted on the theory that the use of nets is contrary to public policy and an invasion of the common rights of the community in the fish supply. But having promulgated excellent laws and appointed officials to enforce them, the public usually withdraws attention, and the netting goes on uninterruptedly. Here and there a constable or fish protector, zealous to do his duty, makes war upon the netters, and often under fire, at actual risk of life, confiscates and destroys their nets. But for the most part the lawbreakers have things all their own way, and the pretense of protection is a farce. In all parts of the country, east and west, where there are inland fishing waters, the fish pirate is found. He is a hard citizen to deal with; and various are the expedients which have been adopted in a vain effort to get the better of him.

New York has devised and is now operating a method of suppressing unlawful nets which appears actually to be accomplishing its purpose. The same anti-netting law which has been on the books for years still remains, but it has been given vitality and force by a system of bounties for the destruction of nets; and for the first time within the memory of man the waters are gradually being cleared of contraband devices. The working of the New York system deserves careful attention, for in it may be found a remedy for the netting evil in other States.

Newspaper criticism of the bounty law in districts affected consists largely in criticisms on the large sums expended in bounties, and there appears to be a studied purpose on the part of certain political organs to misrepresent the system, and to provoke hostility to it on the ground that the bounties entail an inexcusable burden on county treasuries. The fact is that all net bounties are paid by the State, and the newspaper solicitude for county treasuries is either innocently mistaken or intentionally deceptive. It is charged too that gross frauds are perpetrated in bounty claims; and this may be true. The ingenuity of man has not yet devised a bounty system, whether it be for the destruction of vermin or what-not, which was not subject to fraud and provocative of deception; there is something in a bounty reward which develops the latent trickiness of human nature. To decry the net bounty, however, because of the element of fraud involved, is neither good politics nor good sense. The system is a wise one in spite of the tricksters who profit by it; and the proper course is to discover the weak points and the remedy for them. An examination of the subject probably would show that the schedule of rewards is not rightly graded, but that some of the bounties are too high. They are higher than the scale suggested by Mr. Henry Loftie, of Syracuse, who was the author of the bounty system, and at whose suggestion the bill was drawn by one of the officials of the Fisheries, Game and Forest Commission. Mr. Loftie based his measure of offered rewards on the cost of nets, so scaling the bounties that there could be no profit in purchasing nets to turn in for reward. The bounties, as adopted by the Legislature, do perhaps open the way to collecting for nets of a certain class more than they cost, so that it would be practicable to plant these nets for the purpose of destruction. But, as has been pointed out, this is a detail easily to be remedied by the adoption of a new scale of rewards.

The one important fact to be noted is that the bounty law gets the nets. It has actually driven the netters out of business. The waters have been cleared of nuisances. The bounty system has accomplished in a few months what years of protection under the old law did not do, and would never have done. For example, on Oneida Lake, at Lakeport, where in the past more unlawful netting has been done than at any other point, every trap net has been taken, and the netters themselves, whose nets have been destroyed, have now turned around and are capturing the nets of others; that is to say, that the very persons who for years have violated the fishing laws are now allies in its enforcement. At Cleveland, also on Oneida Lake, the glassblowers, seeing in protection from netters a fishing chance for themselves, have turned to and seized eleven large trap nets. The lake is being cleaned up and restored to its old conditions, when honest men had an opportunity to get their share of the fish from its waters. Oneida is only one of the many net plagued waters where the public right is again asserting itself. In short, the bounty law is doing precisely what it was intended to do; and no amount of misrepresentation will blind the public to the truth. The people, once they know what fish protection means, and realize its benefits, will have it, and will retain the system which assures it to them. The net bounty gets the nets, and the net bounty has come to stay.

SNAP SHOTS.

Among the pleasant duties assumed by the FOREST AND STREAM is that of trying to give information to its readers concerning localities where the shooting and fishing are good. This information, collected with a good deal of labor and at considerable expense, is freely given to such of our readers as may apply for it. It is at their service without money and without price. But, while gladly giving out our knowledge on this subject, we must insist that those who apply for it shall use a little judgment and discretion. No man who wishes to go shooting should imagine that he alone of all the world has this desire. He must remember that many others besides himself want to go to the best place, and that the competition for board, guides, teams, and so on at these places is very likely to be sharp. He should realize that it is not enough for him to get the name of a place and then to step aboard his train with his shooting things. If he does no more than this he may learn when he reaches his destination that there is no room at the hotel, boarding house, or farmer's, or that other people, on the ground before him, have engaged all the teams, as well as the services of all the local gunners. Conditions change swiftly in this country. A section that was well protected during the close season, and where birds were abundant on the opening day, may be swept nearly bare a week or two later. No man therefore should think of going to any locality without first writing to it and making definite arrangements for accommodation, transportation, and the services of a man who knows the grounds. If he fails to take these necessary precautions the chances are ten to one that his trip will be in vain, and for this he will have no one but himself to blame.

The competition among dictionary makers insures as a rule that their work is abreast of modern science; but in no authority at hand do we find the term "plankton," defined by Prof. Reigard in another column as the minute floating plants and animals in a body of water.

The Sportsman Tourist.

Along the Potomac.

Fox Hunting in the Old Days.

In my previous article I made a digression from the line intended to follow for the purpose of vindicating or recalling from history a few facts in reference to the status of the Puritans, one of the two powerful classes of colonists who established the foundation upon which the superstructure of the unrivaled institutions of our country rests.

I will now resume my purpose to describe from memory some of the prominent characteristics appertaining to the mode of life of the planters along the Potomac. When the last echoes of the guns at Yorktown had ceased to reverberate, the cavaliers, whose plantations were on that river, returned to their homesteads to repair the damage of neglect and havoc of war. Yet the task of restoration was not as difficult as one would imagine, if we take in consideration the mild and genial climate, generous soil and advantageous surroundings. The soil had recovered a portion of its previously extracted elements while in fallow, therefore quick to respond. And during the time between planting and harvest the immense forests and rivers contiguous afforded ample supplies of game and fish. Therefore they were in a short time living in ease, if not in luxury.

As they increased in prosperity they supplied themselves with all the facilities that wealth could command, and conducted their establishments in the baronial style. It is true they had not armed followers or men at arms, as they were called in the feudal age, but had numerous slaves or servants completely under their authority, with whom they cultivated their extensive plantations, some of which were equal in extent to a German principality.

Although in theory they were somewhat similar in style of appearance to the barons of old, yet practically their customs were antagonistic. The old barons, with their men at arms, would sally out from their strongholds and plunder all unsuspecting wayfarers who were so unfortunate as to approach. On the contrary, the cavalier barons would send out their retainers to invite wayfarers to enter their portals and participate in their hospitality. They were an educated, magnanimous class, fond of social intercourse, and also zealous in their love of field sports, not only the pleasure of riding to the music of the hounds, but the social enjoyment of their agreeable and intellectual companions during the day previous to the hunt, and also the one subsequent thereto. The conditions existing at that time prevented the consummation of a fox hunt in one day. Owing to the great extent of territory embraced in their plantations, the mansions were proportionately distant. Therefore those whom the proprietor wished to participate would be invited a sufficient time in advance to meet at the appointed mansion on the specified day preceding the chase. When he had settled in his mind upon the date to hold a meet, he would send invitations to those he desired to participate in the sport and festivities.

I will attempt to describe some of the details preliminary to a fox hunt, and also the movements in pursuit of the quarry, which took place on the plantation of Col. Thornton, in Westmoreland county, when I was a boy. The first announcement of such an occurence is when the proprietor summons to his presence the overseer of the stables. That position is filled by one of the superannuated field hands, who has under him four or five boys from twelve to fifteen years of age, who perform the duties of feeding and attending to the horses, cattle, etc., under his supervision. The dignitary who occupied the position at this time was Abram Thornton. They frequently adopt their master's name when elevated to a position of authority, if it's only over two boys, and frequently become supercilious.

When Abe received word to attend on his master, he went to his cabin and put on his dress hat and vest, the latter garment a fabric of coon skin; and he proceeded to the great house, where he found his master, who said: "Abe, mount two of your smartest boys and send them to me." Then Abe returned to the stable with the appearance and style of one deeply impressed with the responsibility of his mission.

The boys at the stable were alert, watching through the cracks as he approached, and one of them remarked, "Sumpin' gwine to be done; Uncle Abe got his Sunday close on." As he walked up to the doorway, the boys scattered around, apparently very busy, but watching his movements. As he stepped within he said, "Whar is you all?" At that moment the hounds, confined in a kennel adjoining the driveway and separated by a slat partition, broke forth in a chorus of music such as only a pack of black and tans can render. Abe was surprised, but quickly recovered his equanimity and said, "Marcellus, y'u black sarpint, y'u mus' b'leeve I ain't got no eyes; didn't I see y'u poke a stick from dem cracks frusticatin' dem houn's?"

"'Deed I didn't, Uncle Abe."

The hounds continued in full cry, apparently on a hot trail, and Abe became furious, and said, "Dis worl' is comin' to an eend, w'en dese nigger brats tell me I can't see dem punchin' dem houn's." At this point Hannibal, another of Abe's boys (the race is partial to historical and ancient names), came to the rescue of his companion, and also gave Abe a plausible loop hole to escape from his dilemma. Hannibal said, "Uncle Abe, I 'spec' dem houn's didn't know you wid dem Sunday close on." Abe accepted the explanation and said, "Dat was it, honies; I know dat mus' be it," though he suspicioned what the boys well knew it was—the vigorous odor from his coon skin vest.

After the little unpleasantness had subsided, Abe called Hannibal and Ben, "I got 'ticular bis'ness for you," he said. "Put bridles on dem two young cre'tur's you done broke last week, and go 'megitly to the great house." Ben ventured to ask what for. "You hab orders, dat's what fur."

After the couriers had been dispatched by the Colonel to convey the invitations, nothing unusual occurred until the day appointed for the meet. In the early morning of that day the house servants and stable hands were busy preparing for the accommodation of the guests, their horses and hounds, for on such occasions each guest generally brought with him two or three choice hounds from his own kennels, to compete and compare their qualities with others in the hunt. Abe and his assistants had been extremely busy in preparing the stalls, feed and bedding to facilitate their work in anticipation of the arrival of the guests. About 10 o'clock Abe called one of the boys: "Ephraim, go to your post. Some of dem gentlemen 'll be canterin' down de gran' avenue 'fore you knows it." The post Abe alluded to was a large walnut tree, which had served as a gate post from time immemorial, and also as a lookout post, from the upper branches of which the entire length of the magnificent avenue leading from the public road to the mansion could be seen.

Ephraim had been on his post but a short time when he announced to Abe two horsemen coming in, one of them Mr. Lewis. "How you know Mr. Lewis dat fur off?"

"I knows him by his houn's."

Abe immediately sent a boy to bring the horses and hounds to the stable. At brief intervals the guests came in, and in a few hours all had arrived, the horses and hounds, as well as themselves, and had been provided for with that unaffected hospitality characteristic with those people at that time. The rest of the day and early part of the night they spent in social intercourse, discussing public questions relative to the policy of government and other public topics interesting to gentlemen of intellectual ability and education. It is needless to say those assemblages were composed of such a class of gentlemen. (As an illustration of the present, I would say the San Domingo Ducking Club embraces its social features.)

The following morning, according to arrangement. Abe, with his corps of assistants, had the horses and hounds ready for service in the avenue at the front of the mansion.

This mansion was constructed of brick, and like many others erected in colonial days with the view of capacity rather than architectural beauty, was situated about 100yds. from the Potomac, contiguous to the western side of a grove of oaks extending nearly to the river banks, which grove had been reserved as a screen or barrier to check the fierce and pitiless eastern storms which frequently swept over the broad expanse of the river at this point, gathering moisture and velocity to expand or display its fury upon any obstruction intervening in its career.

That grove had served its purpose admirably for over 100 years, and the last time I was there (about twelve years ago) it was still shielding its charge, although many of its members had succumbed to the tooth of time. Since then the building has been destroyed by fire, except the massive walls, standing a silent reminder of happy days. In contrast with the lonesome and quiet appearance around this historical old mansion at my last visit, the scene presented in that beautiful avenue on a bright morning near the last of November, 1836, was intensely animating, and impressed a picture on my memory which time cannot efface—of the huntsmen ready for the chase—a living exhibition of some of the highest types of animated nature, which would fill the soul of an artist with rapture. A numerous pack of pure bred hounds, uniform in color (black and tan), were yelling and struggling under the restraint of their couplings, held by small negro boys, some of whom were scarcely able to control them in their eager efforts to begin what they evidently knew was expected of them. In addition to and mingling with the musical clamor of the hounds was the ringing neigh of the high-mettled steeds, pawing the ground in their impatience to enter upon the sport, apparently as pleasant to them as to their masters. Alas! that stock of horses is extinct, consumed by the relentless demands of war's devastation.

No more this steed will hear the sounds
Of huntsmen meeting for the chase;
No more the music of the hounds
Will urge him onward in the race.

Since then
Many times through showers of lead
And sheets of flame they led the way;
And many a gallant charge they led
Beneath a Southern boy in gray.

The clamor and excitement outside admonished the huntsmen and members of the family within that their presence only was necessary to proceed in the programme of the hunt. They immediately passed out to the portico, which extended entirely across the front of the mansion, and was elevated 6ft. above the ground, affording a comprehensive view of all the movements of the occasion. In addition to the huntsmen, several lady guests, with Col. Thornton's family, occupied the portico and enjoyed the exciting scene. During the height of the excitement, when the hounds were struggling for release from the colored boys, an episode occurred characteristic of their race. One of the smallest of the boys was holding two powerful hounds with a short rope attached to their couplings, which he had fastened around his waist, to make sure of them; but they were too strong, and made sure of him, and compelled him to follow them, sometimes at a lively gait. Abe, the manager of the boys, discovered his predicament and went to his rescue, exclaiming, "W'at is you doin'?"

"I's holdin' deze houn's."

"Dem houn's is holdin' you. W'at's you' name?"

"I's name Samson."

"You tell you' mudder you ain't got no mo' use for dat name den a frog wants a tale."

After glancing over the scene the huntsmen descended from the portico, and as each one advanced to the mounting block his horse was brought forward, and he vaulted to the saddle with an adroit and graceful movement, acquired only by continual practice from boyhood.

Awaiting the Signal.

The scene at this stage of the entertainment was one of unsurpassed sylvan beauty—a living picture sufficient to relax the rigid features of an anchorite, and constrain him to forget his austerity in expression of admiration. A group of accomplished horsemen, apparently as firmly seated as Centaur, and seemingly unconscious of the efforts of their steeds to dislodge them, in their impatience of restraint. A large pack of hounds equally as eager and restless of control as their companions, the horses. Also a quota of colored boys, shouting with delight in their excitement. Such was the exhibition at the mansion end of the avenue.

The avenue had been in colonial days a feature of great beauty, and still retained surviving indications of its palmy days. It was evidently in English style, about 100ft. in width, perfectly straight and planked on either side with Lombardy poplar and English linden trees alternately. Although the great majority of them had succumbed to age and the elements, yet there was still standing at irregular intervals an occasional linden or giant poplar, rearing its graceful spire-like peak 100ft. in the air, apparently defying the wintry blasts, and vividly reminding us of silent sentinels standing on a battlefield with their dead comrades lying around them.

The morning was such as is frequently experienced in that section of country during the Indian summer, when the frost has invested field and forest in the robes of the rainbow. The trembling foliage on the lofty pinnacles of the forest was just bathed in the golden beams of the rising sun, when the shrill notes of the horn announced the signal to release the hounds.

Upon hearing the familiar signal they swept down the avenue as resistless as a tornado, and wild with delight, perhaps with an innate knowledge to appreciate their abrupt change of condition; for previous to their release they had been under the control of the huntsmen; now the huntsmen were controlled entirely by their movements, and they seemed to scorn the idea of receiving direction from them what course to follow, but swept onward, confident in the knowledge nature had given them, which is seldom erroneous. The horses, although under the guide and partial restraint of their masters, were equally as eager as the hounds, each exerting himself to gain the position as leader of the cavalcade down the avenue. Their ambition and stamina were such that it was difficult to pass the one which first succeeded in gaining that desirable position.

All were dauntless, swift and true,
As any steed which trod the earth;
Their leader—all his comrades knew,
They could not pass his saddle girth.

The hounds, after leaving the avenue, wheeled sharply to the left (moving with the celerity of a regiment of zouaves swinging around a flank), entering an old wood road flanked on either side with a dense growth of sapling pines. They had passed about half-way through this thicket when old Music, the leader, came to a sudden stop. He had struck a warm trail crossing the road at right angles, which brought the entire pack to an abrupt halt. It was one of those occasions when hounds are required to develop their sagacity to unravel a mystery which baffles the skill of man. It was evidently a very fresh trail, as every hound when approaching gave tongue in its piercing yelps, indicating certainty. Which direction did the game pursue? It is in solving this problem that they display their finest points of sagacity. It is true they are endowed with the faculty of scent, and can readily discriminate the different quadrupeds by the odor of each species. In this case (and I suppose all others similar) they spread along the trail, and walked eagerly, some in one direction, others opposite, each returning in its own tracks, carefully scenting the opposite sides of the grass and shrubbery along the trail. They appeared to arrive at an unanimous conclusion by a simultaneous tonguing and impetuous rush in one direction. The trail led obliquely through the pine thicket to an old sedge field about a half-mile distant. The thicket was so dense the hounds made slow progress, which enabled reynard, being much smaller and no doubt familiar with the locality, to widen the breech between his pursuers and himself, thereby gaining time sufficient to accomplish one of the numerous stratagems inherent in the race—to foil its relentless foes.

The huntsmen, after listening to the hounds a few moments to ascertain the direction of the chase, and finding it impossible to get through the pine thicket, continued to ride rapidly along the road, which terminated at the field mentioned, about 200yds. from the point where reynard entered it a few minutes after they arrived. As they were in a position to scan the entire field they remained quiet to observe developments.

At the point where reynard left the thicket and entered the field there was a footpath extending along the brow of the hill adjacent to and flanking Pope's Creek, which had been used by pedestrians from time immemorial. Intercepting this path about half-way across the field, there was a deep gully or wash, resulting from frequent rains, cutting out a spring branch; it was about 20ft. in width and 15ft. in depth. To obviate the delay in walking around it, a large tree had been felled across the chasm, thereby bridging the pathway. The fox, when leaving his cover, failed to notice or discover the huntsmen, who had halted at the side of the field, and quietly observed all the movements he made. He hesitated a few moments, evidently listening for the hounds, to estimate their distance, then started at full speed along the old pathway. After crossing the chasm on the tree, he continued on about 150yds., then returned direct in his tracks until reaching the tree, from which he leaped into the gully, in which a small stream trickled over its gravelly bed. Down this he pursued his way to the shore of the creek, which he followed close along the edge of the water in the direction to return to his favorite stronghold, the pine thicket, which he succeeded in reaching. By his stratagem of breaking his trail the pack was demoralized to such an extent that before they recovered their equanimity by unraveling the mystery of the lost trail reynard had turned their flank and was cavorting through the labyrinths of his familiar sporting grounds—the pine thicket.

When the hounds had succeeded in extricating themselves from the many windings of that thicket, in which their crafty adversary had inveigled them, they were

furious. As the trail was straight and open, and the odor strong, no doubt a feeling of confidence animated them to extra exertion; and they rushed across the field like a tornado, crossed the log bridge, and continued their wild rush, each hound tonguing its musical notes of anticipated conquest. Upon arriving at the point where the fox had doubled, the music ceased; silence superseded exultation. They walked around in very direction, eagerly scenting every inch of ground until they ascertained the true condition. Then, while rushback over the trail, they made the welkin ring with savage yells—only to be doomed to disappointment again. Upon reaching the end of the double trail (where the fox had leaped from the log) they quickly discovered that they had been foiled again. Although worn down by unusual exertions to capture the most wily antagonist they had ever attempted to conquer, yet undaunted they spread themselves over the ground as a cordon of advance guards, examining the country to prevent a surprise. The fox had been careful to leave no scent on his trail when turning the flank of his pursuers; therefore he pursued his way in the edge of the water along the shore of the creek, until reaching a point directly opposite his stronghold—the pine thicket. To gain access thereto he was compelled to cross a strip of dry ground. It was here after long search that the hounds found the clue to the lost trail.

When the music from the hounds announced to the huntsmen that they had recovered the lost trail, they concluded to end the hunt, for the day was nearly spent, the hounds were tired, and they had enjoyed all the pleasant incidents of an exciting chase, and had witnessed the crafty stratagem of the fox and also the sagacious movements of the hounds to overcome his cunning; and inasmuch as reynard was the principal factor in contributing to the pleasures of the hunt it would detract rather than add to the enjoyment to harass or pursue him further, and perhaps witness the bleeding trophies, his mask and brush torn from his prostrate body, while the merciless hounds are snarling over his trembling form, callous and deaf to his imploring eye and dying moans for mercy.

Then the bugle's echoing sound
Called from the chase the weary hound.

JAMES NORRIS.

CECIL COUNTY, Maryland.

An Adirondack Night Experience.

"GOING to the woods, are you?" said George, as he hitched himself into a still easier position in the most comfortable chair my den afforded, and eyed me curiously. "I once had a little experience myself that it might be well to tell about. My wish is that no fools shall rush in, entirely unwarned, where angels fear to tread, and whenever any one, particularly an old chum like you, is all at once afflicted with an insatiable longing for a lodge in some more or less vast wilderness, at fifteen dollars or so weekly; when a good fellow, let me reiterate, manifests a gnawing desire to sneak away on the morning train to regions far from the haunts of men and good living, vast contiguities of shade infested by the friendly and ubiquitous mosquito whose bite ceaseth not, there's an old, well worn and favorite yarn of mine I want to spin for this would-be pilgrim to the shrine of nature.

"In the first place, long before you are ready to start comes the bother of getting everything together. How well I remember the bustle of preparation for that first trip of mine. Like yourself, I was in the tenderfoot stage, and determined to forget nothing essential to a camper's happiness and well being. Check-lists supposed to enumerate the requirements of an outfit were studied with an earnestness worthy of a better cause, but these same check-lists, let me say, are not much help to any one. If a fellow reads them and hews to the line, let the chips fall where they may, he will carry almost everything, from the Book of Common Prayer to a cross-cut saw, and quite probably leave behind something that would prove handy enough later. In fact, all this matter of preparation is often to the inexperienced only perplexing weariness and vexation, a fitting prelude for tiresome jaunts over difficult and patience-trying trails.

"We got started at last; in high spirits, of course, conscious of a pleasing sense of joyful anticipation, and dissatisfied only with the law which forbade our bagging more than four deer between us. I might add, however, parenthetically, that we returned without having incurred the severity of this statute, or injuring the Adirondack game.

"The prosaic train ride was quite too civilized to interest Nimrods like ourselves, but our buckboard which met us at the station proved more befitting. Anything less steep and rocky than Washington or Bunker Hill monument is considered an excellent wagon road in the region we were penetrating, and it proved an exciting drive, made more so if possible by the gentle and joyous reminiscences of wrecks and smash-ups which bubbled as it were spontaneously from our charioteer whenever a particularly dangerous place was passed.

"It was almost a relief, and certainly an agreeable change, to leave the horses and stagger off along an old disused wood trail, bending atlas-like under our now much condensed, but as we found to our sorrow, ponderously heavy baggage, which was packed in baskets and carried upon our backs. True, as the miles were left behind, the novelty of this mode of travel wore away to a large extent, along with the skin on our shoulders under pack straps; but we were not in constant dread of being suddenly overturned into a miry slough of despond, or rolled violently down some steep place on to inhospitable stones.

"Camp was reached finally, after infinite labor and sorrow, and we found it pretty enough almost to be worth the trouble. Our little cabin, a small log structure, was built on the bank of a rapid and very winding stream. The place in its wild simplicity was attractive, and the thickly clustered evergreens which grew close down to the water's edge were only rivaled in grace and beauty by their images in the water. With the assistance of our guide, we soon had a good fire blazing and everything made as comfortable as in the nature of things they could be. After supper, consisting principally of broiled venison, we talked over the plan of action. The venison, by the way, to which we were introduced for the first time on this occasion, after repeated soul-harrowing and stomach turning boilings, was made to do duty three meals a day for a whole week, but ignorance was bliss, and no grewsome presentiments of our guide's economy disturbed the pleasure of that first night around the fire.

"Hounding and hunting from a boat at night, with a bright light or 'jack' carried in the bow, were legally forbidden, and we were therefore forced to depend largely upon still-hunting. What an attractive term, this 'still-hunting.' Does it not in itself suggest the unerring rifle of Leatherstocking, or the intuitively perfect woodcraft of the Mohican? We tried it and found no difficulty except that we saw no game, and could not keep still. Our best and most painstaking efforts in this direction produced sounds, unworthy perhaps of a steam shovel in full blast, but more than might reasonably be expected of some wandering cow, but we always frightened off everything except the hedgehogs, which unfortunately were not worth the killing.

"At nightfall and in the early morning we watched paths or runways supposed to have been frequented by deer, but nothing I ever saw disturbed my belief that this frequenting must have been in some pregeologic age. Perhaps the "signs," which our patient and well-paid guide so eagerly pointed out to prop up our drooping spirits, were really the work of frisky and reckless mammoths and mastodons in the remote past.

"When we had decided upon our watching places it did not take us long to learn to find them for ourselves and the guide soon ceased to help us in this respect, keeping lookout for himself at some more remote and favorable location. One afternoon J—— and I had been patiently and laboriously making the shocked solitudes resound with our still-hunting, and upon returning late after an uneventful day we found that our guide had left for his evening vigil. Not wishing to miss a single opportunity, nor to delay too long, we hurriedly re-examined our guns and left camp for our watching places.

"Mine was south of camp, the trail skirting the river for a short distance and then crossing on a log jam left from the lumbering operations of the previous spring. Crossing this rude bridge, I walked briskly up the hill, as it was rather too late already, but the way seemed longer and more obscure than ever before, and to save time I accelerated my pace almost to a run. One peculiarity about becoming involved and finally lost in these regions is that the victim rarely realizes his dilemma until he has increased his confuson by some impatient and unwise act like this. The result in my case was that by the time I realized I must be 'almost lost,' the river, which by its murmuring served as an excellent guide, was left behind, entirely out of hearing. Having paid thus dearly for hurrying off in some wrong direction, I determined to think things over before traveling further. One point seemed assured, I had progressed down stream from the camp, and therefore by finding the river and following it up stream a way would be found out of the labyrinth. Obviously, therefore, the water was to be first sought, and I accordingly set out to find some little stream that might lead down to it. Fortunately this was soon discovered, and following the current in what seemed exactly the wrong direction, I was at last rewarded by the welcome sound of rapids in the larger stream. The bank that I came out upon was quite high and strangely unfamiliar, but I pushed bravely along as rapidly as the nature of the ground would allow, there being no trail (another surprising circumstance). At various points the curving of the bank made it possible to look up stream a considerable distance, and numbers of log bridges could be discerned, but each, upon nearer approach, proved to be unlike the one I had first crossed upon. Most of them did not extend entirely across, a strip of dark and rapid water being between the last logs and the shore.

"By this time the deepening twilight was rendering everything obscure, and traveling even over good trails practically impossible. The high bank was at some points rocky, making the footing very insecure, and I had some narrow escapes from a slip into the stream below. It therefore seemed necessary to select some good place to make a night of it, and remembering stories of panthers being occasionally heard of at various points not very far distant, I determined to stop where any possible attack could be met at an advantage. Coming opposite a little island in mid-stream, connected with the shore by a more or less uncertain log bridge, this seemed to be the best choice, and with some trouble I climbed over to it. Now came the most disappointing thing, the very unkindest cut of all, for upon looking in my coat pockets for matches and knife, I discovered that in the hurry of starting out I had put on the wrong coat, consequently all my matches were at camp and I must do without a fire and with no more sociable companion than my rifle. I noted with satisfaction that the magazine was nearly full. I had fired a few shots at first in the hope of attracting the attention of some one who could show me the way out, but these bringing no result, further signal firing seemed only a waste of ammunition. There were six of the heavy cartridges remaining, and I viewed them almost with affection.

"Perhaps you can imagine something of the freezing discomfort and loneliness of that long night on my island. After having been through any similar experience no one could ever think of blaming Prometheus for stealing that fire from heaven. Rapid traveling and my efforts to find my way out had made me very warm; consequently the chill wind and lowering temperature were to say the least exceedingly uncomfortable. The shadows lengthened, and darkness settled down until sunlight remained visible only upon the tops of the tallest evergreens. These, growing upon the opposite shore, towered high above the surrounding deciduous foliage, sharply outlined against the sky. Finally even this light grew faint, darkened and went out, and I was left with only the stars (which now began to appear one by one) for company.

"I was so miserably cold that it was impossible to lie down, and besides I wanted to remain alert; so the most desirable position I found was to stand with my back against the tree. For amusement I could keep a sharp lookout to guard against any possible danger, watch the stars rise and finally go down, or listen to the dull moaning of some distant rapids. Late in the night mists were driven down the valley and across my island, a chill and decidedly disobliging wind having sprung up. I was made aware of the presence of these mists in a startling and somewhat weird way. Without a watch it was impossible to have a very clear idea of time, but a few hours before dawn the low trees, which grew about me on my little island, were suddenly covered with a peculiar phosphorescence, looking somewhat as moist snow occasionally does on damp winter mornings. There was nothing substantial about it, but in its soft brilliancy, where the branches were quite close, it seemed to half obscure the sky, the stars shining only faintly through. This odd appearance would vanish as instantaneously and as mysteriously as it came, only to again and again suddenly reappear. It puzzled me for quite a time, and I never talked with anyone who could fully account for the phenomenon. My theory is that mists illuminated by the star light produced these odd effects. Quantities of vapor floated over the water also assuming at times odd and fantastic shapes.

"The night aged and grew gray at last, and a brilliant morning star told me that my travels could soon be recommenced. A breakfast, however small, would certainly have been appreciated, but making the best of the situation, I pushed on without it, and a short distance above my island found a crossing which made it possible to regain the other side, where, to my delight, I found a trail. It seemed as if I had certainly traveled far enough to make camp, and at each bend I climbed out to the bank and looked up stream, only to see great quantities of mist rising from the water, under the influence of the morning sun, and not a familiar landmark. To add to my discomfort, the trail, which had seemed such a good friend in my adversity, was growing fainter and more faint, and I repeatedly lost it. At last all trace of path disappeared altogether, and after groping about for a time in vain efforts to find it again I began to realize that many hours of the hardest kind of traveling had only exhausted my sadly needed strength, without apparently enabling me to get any nearer to my friends. I remember making a mental calculation as to how long anyone could endure the fatigue of travel in a rough country with nothing to eat, for the woods were silent and forsaken, destitute of all appearances of any living thing.

"It finally occurred to me that I must be on some tributary stream, and that by following it down I would find the main river, or possibly some camp. I set out therefore in the opposite direction, and was rejoiced to see that the trail became more easy to follow as I progressed. In short, I had builded better than I knew in making this last change. When first lost I had traveled further than had seemed possible before realizing my predicament, and the river being very winding, I had at last come upon it above our camp, and not below, where my watching place actually was; consequently, in going up stream my course had been in exactly the wrong direction, and as I traveled down the trail familiar landmarks soon were to be seen.

"I reached camp at last to discover that my companion and the guide were already gone to look me up, but a shot from my rifle brought back the guide, who signaled to the remainder of our party. Congratulations were exchanged, and our guide inquired, 'Whar I thought I'd been,' a question I have never been in a position very clearly to answer.

"Shortly afterward we returned to civilization, and with me the cure of the hunting fever was so complete and permanent that I have never experienced even the slightest attack since."

The Ascent of the Grand Teton.

CHILLICOTHE, Ohio, Sept. 9.—I note in FOREST AND STREAM of Aug. 27 your editorial comment on the Associated Press dispatch recently sent out from Cheyenne, Wyoming, and extensively published in the newspapers, of the so-called first ascent of the Grand Teton by W. O. Owen and others, and your statement that this is the first successful ascent.

The highest pinnacle of the Grand Teton was first ascended by Hon. Nathaniel P. Langford and Captain Stevenson, on July 29, 1872. A full and complete account of their expedition to and first successful ascent of the peak, written by Mr. Langford, appeared in the June number, 1873, of the then Scribner's, now Century, Magazine. In their ascent, Langford and Stevenson found upon a buttress of the mountain, near its summit, the remains of a stone shelter or house, evidently of great age, and their description of this remains has apparently led to a misapprehension of the fact that they made the highest point of the mountain itself. But that they made the first ascent of the great peak, so far as we have any authentic account, is beyond question. Stevenson is dead, but his companion, Hon. N. P. Langford, to whom more than any other person is due the establishment of Yellowstone National Park, now lives at St. Paul, Minn. The Grand Teton is an extremely difficult and dangerous mountain to ascend—more difficult perhaps than any of the Alps—and Mr. Owen and party are entitled to great credit for having reached its summit, but the honor of its first ascent belongs to Langford and Stevenson.

LUTHER B. YAPLE.

A Costly Zoo Specimen.

THE famous donkey which was brought back from the Soudan by the Australian volunteers who went there in 1885 has just died. That donkey cost the country something like £350,000, for that was the cost of the expedition, which resulted in nothing but the securing of the donkey. Most of us have heard of the apt and philosophical rejoinder of the late Sir Henry Parkes, when somebody alluded to the expense involved in securing the donkey by the Sydney Zoo. "I am sorry to say," he said, "that it isn't the only donkey that has cost us £350,000."—Sydney Daily Telegraph.

Natural History.

The Crane's Back.

A FEW weeks ago I was sitting in my lodge talking with White Calf, a venerable chief of the Piegan Blackfeet. It was the time of the medicine lodge, and I was asking him some questions about the religious ceremonies that I had just witnessed. That morning the sacred bonnets had been transferred from the medicine lodge women of last year to those of this year, and among the ornaments of one or more of these bonnets were the stuffed skins of several rail (*Porzana carolina*).

"Why is it, my friend," said I, "that this little bird is sacred among the Piegans? Why do they put it on these sacred bonnets, and why do they have it in their medicine bundles, as I have sometimes seen it and its feathers on the stems of the medicine pipes through which we pray?"

"My son, I cannot tell you," he said, "but we all know that this little bird has great power. We call it ho-ó-tin, heel. We do not often see it. Only once in a while a person may see one walking among the grass at the edge of some little lake, and then if he stops to look closely at it suddenly it disappears and is seen no more. Sometimes too we hear it. It has a loud voice. It calls out strongly. Perhaps this is so that its enemies may be frightened and run away."

"Yes," said Big Plume, a middle-aged man, "the heel bird has strong power. I think maybe we consider it sacred because it is so scarce a bird on the prairie, and because it can hide itself well. Perhaps it is for this reason that the people use it in the medicine lodge and use its feathers to ornament the stems of the medicine pipes."

"Pi nut ú ye is tsim o kan," said White Calf to me. "I do not think you know how it is that these little birds go to the warm country when winter draws near."

"How do they go, father?" said I.

"I will tell you," he replied. "The cranes carry them on their backs from the north to the warm country. They ride on the cranes. This is how we know it: Once a good while ago, in the fall of the year, two cranes were going south and alighted on the prairie. Near where the cranes were two men were sitting down, and they watched them. When the cranes rose to fly on their journey southward, they passed over these two men, who shot at them and hit one of them; and as it fell the men both saw one of these little birds roll off its back. This is how we learned first that the cranes carry the heel bird to the warm country."

As he talked there flashed across my memory the account of the "crane's back," published many years ago in FOREST AND STREAM by Dr. J. C. Merrill, and the widespread belief, among the primitive peoples both in the old world and the new, that many small birds perform their migrations or travel here and there on the backs of the larger birds. Of positive scientific evidence that this is done there is perhaps but little; yet as will be seen from quotations given below some eminent ornithologists believe that this takes place, it is generally credited among certain tribes of Indians of western North America, and is a belief common to the people of southern Europe and of northern Africa.

In order to bring to the reader's mind the chief facts which have been printed on this subject we quote from FOREST AND STREAM Dr. Merrill's original letter on the crane's back, published in March, 1881, and a subsequent article printed in FOREST AND STREAM in April, 1888, from the pen of the well-known naturalist Dr. J. E. Harting, long the natural history editor of the London Field:

I notice that in the FOREST AND STREAM of Dec. 23 you reprint a letter published in the Evening Post on the subject of wagtails crossing the Mediterranean Sea on the backs of cranes and storks. This has the indorsement of the eminent ornithologist Von Heuglin, and induces me to report a general belief among the Crow Indians of Montana that the sandhill crane performs the same office for a bird they call napite-shu-utte or "the crane's back." This bird I have not yet seen, but from the description it is probably a small grebe. It is "big medicine," and when obtained is rudely stuffed and carefully preserved. I hope to have one brought to me soon for identification.

The Indian's account of the bird is as follows, and I give it for what it may be worth, adding that I have been assured by a very intelligent and observing hunter, who has lived in Montana for eighteen years, that he has noticed the same habit:

"The 'crane's back' arrives and departs with the sandhill crane, and except when nesting is rarely seen far from that bird. About ten or fifteen per cent. of cranes are accompanied by the 'crane's back,' which, as the crane rises from the ground, flutters up and settles on the back between the wings, remaining there until the crane alights."

Such is the Indian account, and many of their hunters and chiefs have assured me that they have frequently seen the birds carried off in this way. At these times the bird is said to keep up a constant chattering whistle, which is the origin of the Crow custom of warriors going into battle, each with a small bone whistle in his mouth; this is continually blown, imitating the note of the "crane's back," and as they believe preserves their ponies and themselves from wounds, so that in case of defeat they may be safely carried away, as is the napite-shu-utle. The Cree Indians are said to observe the same habit in the white crane. J. C. MERRILL.

FORT CUSTER, Montana, February, 1881.

About seven years ago Dr. J. C. Merrill published in these columns a most interesting note on the "crane's back." This, according to the Crows, from whom Dr. Merrill derived his information, is a small water bird, probably a grebe, which is said to perform its migrations on the back of the sandhill crane.

Shortly after the publication of this note, we alluded to Dr. Rae's observations in the far North, which credited the Crees with a similar story of a small finch-like bird which migrates on the backs of the wild geese. Bearing on the same point is a note by our lamented friend, J. C. Hughes, who found a young sandhill crane unable to fly, under circumstances which pointed strongly to its transportation on its mother's back.

In a recent number of the London Field, the well-known naturalist, Dr. J. E. Harting, calls renewed attention to this widespread belief among people, civilized as well as savage, and brings together a great deal of interesting matter bearing on the point in question. He says:

"At a recent meeting of the Linnæan Society, Dr. John Rae, the well-known Arctic traveler, read a paper relating to the birds and mammals of the Hudson Bay Territories, and in the course of his remarks referred to the assertion of the Cree Indians, both at Moose and York Factory, that a small passerine bird, which was pointed out to him, but the name of which he has forgotten, habitually avails itself of the Canada goose when migrating to get a lift in the same direction, they having frequently seen it fly off from a goose when shot or shot at on the wing. All the coast Indians of Hudson Bay, says Dr. Rae, devote a month or more every spring to shooting wildfowl (chiefly geese), the birds killed forming their entire food for the time. As soon as the geese begin to arrive the Indian constructs a concealment of willows and grass, usually near a pool of open water, at the edge of which he sets up decoys. When geese are seen approaching, usually flying at a great height, the Indian imitates their call, and the geese, on seeing the decoys, circle round, gradually coming lower down until within shot, when they are fired at. It is from high-flying geese that the small birds are seen to come. If the geese are flying low it is a pretty sure indication that they have already rested on the ground somewhere near after their long flight, when of course their tiny passengers would have alighted. The Indians on the shores of Athabasca and Great Slave lakes—both great resorts of wild geese—and those living on the Mackenzie River, more than 1,000 miles to the northwest of Moose Factory, tell the same story, and from the positive statements which were made to him on the subject Dr. Rae saw no reason to doubt the assertion. So far as he could ascertain, the Canada goose is the only species in North America which thus acts the part of a locomotive, and conveys small passengers from place to place; but in Europe and Africa the common crane and the stork have on very respectable authority been credited with performing a similar friendly office.

"Dr. Lennep, in his 'Bible Customs in Bible Lands,' refers to the many small birds which find their way from Palestine into Arabia and Egypt on the backs of cranes, over lofty mountains and sea, which without such aid it would be difficult to cross. In the autumn flocks of cranes are seen coming from the north with the first cold blast from that quarter, flying low, and uttering peculiar cries as they circle over the cultivated plains. Little birds of different species may then be seen flying up to them, while the twittering of those already comfortably settled upon their backs may be distinctly heard. On their return in spring they fly high, perhaps considering that their little passengers can easily find their way down to the earth.

"In some instances, however, the small birds have been seen to come off the backs of the larger ones just as the latter were about to alight. An American visitor to the Island of Crete in the autumn of 1878, as related by Prof. Claypole, of Antioch College, Yellow Springs, O. (Nature, Feb. 24, 1881), satisfied himself that wagtails and other small birds cross over from Europe on their southward migration on the backs of cranes; and although on first hearing the statements made he was extremely incredulous, he afterward, on one occasion, had ocular demonstration of the fact. A fisherman in his presence discharging his flint-lock at a flock of passing cranes, he saw three small birds rise up from among them and disappear.

"A German author, Adolf Ebeling, writing in the Gartenlaube, asserts that he found it currently believed at Cairo that wagtails and other small birds cross from Europe to Nubia and Abyssinia on the backs of storks and cranes, and details the result of conversations which he had with several independent witnesses, all testifying to the same thing. He then proceeds: 'At supper in the Hotel du Nill I related the curious story to all present, but naturally enough found only unbelieving ears. The only one who did not laugh was the Privy-Councillor Von Heuglin, the famous African traveler, and excepting Brehm the most celebrated authority of our time on the birds of Africa.' On asking his opinion, he remarked, 'Let others laugh; they know nothing about it. I do not laugh, for the thing is well known to me. I should have made mention of it in my work if I had had any personal proof to justify it. I consider the case probable, though I cannot give any warrant for it.' 'My discovery, if I may so call it,' continues Herr Ebeling, 'I would have kept to myself, even after Heuglin had thus expressed himself, had I not since discovered a new authority for it. In the second edition of Dr. Petermann's great book of travels I find the following: 'Prof. Roth, of Munich, related to me, in Jerusalem, that the well-known Swedish traveler, Hedenborg, made an interesting observation on the island of Rhodes, where he was staying. In the autumn, when the storks came in flocks over the sea to Rhodes, he often heard the notes of small birds, without being able to see them; but on one occasion he observed a party of storks just as they alighted, and saw several small birds come off their backs, having been thus evidently transported by them across the sea.'

"In the face of such testimony then as that above mentioned, and the admission of his belief in the story by so experienced an ornithologist as Heuglin, the conclusion seems inevitable that there must be some truth in it, and it has received some confirmation from a singular observation since made in England. Mr. T. H. Nelson, of Redcar, writing to the Zoologist for February, 1882 (p. 73), reports an occurrence related to him by an eye witness, Mr. Wilson, the foreman on the South Gare Breakwater, at the mouth of the Tees, which bears directly on the question at issue.

"On the morning of Oct. 16, fine and cold, wind northerly, Wilson was at the end of the Gare when he saw a 'woodcock owl' (short-eared owl) 'come flopping across the sea.' As it came nearer he saw something between its shoulders, and wondered what it could be. The owl came and lit on the gearing within 10yds. of where he was standing, and directly it came down a little bird dropped off its back and flew along the Gare. He signalled for a gun, but the owl saw him move, and flew off. He followed the small bird, however, and secured it, and on taking it to the local bird-stuffer for preservation learned that it was a golden-crested wren. To see its irregular and apparently weak flight in passing through the air on a stormy day it would never be supposed that so tiny a creature as the golden-crested wren would attempt to cross the sea, or would succeed in doing so if it tried. But that it travels to and from the Continent in spring and autumn is a fact which has been well ascertained by many competent obervers. On the coasts of Yorkshire and Lincolnshire, says Mr. Cordeaux, the autumnal migration of the gold-crest is as well known as that of the woodcock, and from its usually arriving just before that species it is known as the 'woodcock pilot.' The North Sea fishermen assert that these little birds often alight on their boats, and in foggy weather perish by hundreds. The same thing has been observed by Mr. E. T. Booth off the coast of Norfolk. There is then nothing so improbable as might at first sight appear in a gold-crest crossing the North Sea and alighting tired on the broad platform afforded by the expansive back and wings of a short-eared owl traveling at slower speed beneath it. At any rate, the fact remains that the gold-crest was seen to descend from the owl's back when the latter alighted, and its identity was placed beyond doubt by its subsequent capture. There is, verily, in heaven and earth much that is still undreamed of in our philosophy."

Dr. Merrill, who has kindly loaned me his clippings on this subject, writes that his reason for believing the bird described by the Crows to be a grebe was that they said it sometimes (or usually) alighted in the water. "In other respects a rail agrees perfectly with their account." But of course we must remember that in being interpreted from one language to another matters are likely to be more or less misunderstood, and that the Crows may have said alighted near by or close to the water, which the interpreter may have translated as "in." The "chattering whistle" which gives the bird a part of its importance among the Crows certainly applies well to the rail. Among the Blackfeet the bird was identified as stated by specimens. GEO. BIRD GRINNELL.

NEW YORK.

Snakes in Captivity.

SOME years ago, when the writer was returning from a ramble through the Pennsylvania woods, his attention was attracted to a rustling in the grass, and there he saw a tiny toad struggling feebly to escape from the jaws of a slender snake, whose delicately striped body resembled a dainty bit of ribbon. While watching the little toad disappear down the reptile's rapidly moving jaws, a new arrival appeared upon the scene; from among some loose stubble glided a spotted snake of much larger proportions than the first, and quickly grasping the smaller by the head swallowed feaster and toad until only an inch or so of wriggling tail protruded from its mouth, when, observing the human intruder, it turned quickly and disappeared whence it came.

This curious little tragedy, so quickly enacted and among such queer creatures, excited the writer's interest in the serpent race and prompted him to collect and study the habits of these creatures.

In a number of large glass-fronted cages are the snakes of his collection; some lying coiled and motionless; some gliding slowly up and down branches provided them, while others, from the desert regions, lie buried in the sand at the bottom of their cages, with only the head and neck protruding from the surface.

It is feeding time and the snakes are about to be provided with their weekly meal—the diet is variable, consisting of frogs, mice and fishes. A mouse is placed in the cage with the deadly desert viper—the horned cerastes from Egypt—the little creature runs timidly about, not observing the scaly gray body with sinister heart-shaped head that has been so slowly issuing from the sand. The serpent's neck is drawn back into the shape of a letter S, and its glassy eyes have dilated as it prepares to spring. Suddenly there is a flash of its pink jaws, a feeble squeak, and the little gray mouse lies quivering before it, struck by the deadly fangs. Carefully the reptile examines the body of its victim, and after satisfying itself that the prey is quite dead it slowly engulfs its meal, swallowing it entire, and without mastication, when it once more crawls into the sand, disappearing for a moment, only to again thrust forth the head and neck to await, motionless and silent, the approach of further prey.

Far differently does the agile milk snake of our New England States attack the mouse introduced into its cage. This reptile is harmless, and must kill its prey by force. Quickly it rushes upon the terrified rodent and grasps it by the nose, while coil after coil of the spotted body are thrown around the struggling creature, which is quickly squeezed to death. But here is still another snake eagerly waiting its meal; this species, our common garter snake, has no power to squeeze its prey to death, so swallows it alive, a fish rapidly disappearing down the elastic jaws of the reptile, when it darts forward ready for more.

Thus snakes take their prey in three different ways: The venomous reptiles killing it by a stroke from the fangs, the harmless constrictors squeezing it to death, and lastly the little garter snake which gobbles down its food without further ado.

Snakes in captivity become remarkably gentle and tame, and seem to enjoy being handled. They are perfectly devoid of slime, their shiny appearance being caused by the delicate, highly polished scales. A slender blacksnake, which has been in captivity for a number of years, is often allowed the liberty of the writer's room, and seems to take great delight in roaming about, satisfying its curiosity. In winter it will frequently be found coiled in the wicker work of a chair near the fire, enjoying the warmth, while in summer it seeks more elevated quarters, and may be seen stretched along the top of a curtain rod, peering over the side and watching every movement of a visitor.

In a perfectly round coil, its vivid markings of green

yellow adding to its formidable aspect, lies a huge imen of the most deadly of American snakes, the mond rattlesnake. True, this serpent has been reared aptivity from a youngster of 15in. long into this ster of 6ft. in length; but the instinct of its parents herited. When approached a deep-drawn hiss is d, and the reptile rises slowly as if inflated by a bel-; at this time the rattle begins to quiver, and a sharp ing sound is heard, exactly like that produced by field locust. "Let me sleep," protests this formidable ture as it lies sullen staring at the object of its an-nce.

e old rattlesnake flag bore a very appropriate motto, he rattlesnake, as well as all of our venomous ser-s, seeks to warn before striking. The copperhead lly shakes the tail when alarmed, producing a sharp ing sound; the vipers of Europe and Africa hiss ly when disturbed, while the cobra and hamadryad, most formidable reptiles known, raise the forward of the body from the ground and spread the neck ood before biting.

though these poor creatures have been so mercilessdandered, they are by no means so bad as most le imagine, for of the entire serpent race only one- is composed of dangerous species, and all of these d much rather seek security than combat. More-, snakes are of economic value, as they destroy in-us creatures of the field.

RAYMOND L. DITMARS.

Voices of the Night.

this season of the year all persons may note the ge of birds at night by the calls that come floating n from above and that continue until daylight ap-s. The most prominent is a clear whistle that is the most persistent, beginning in north New York in August and continuing through September. ts that are lowery or foggy are more musical than hose that are clear and flooded by moonlight. Re-ses come to the calls from right and left, and one s to the gradual lessening of tone as the wanderers far on in the darkened south. To note the first hat floats through the open window of early August ne reclines for slumber brings the feeling of sad-that the summer is ending. Who can escape that g of regret that the year has reached its full, has ght forth the earthly kind, and is thenceforward to ne?

is doubtless true that bird migration is generally by t, and the birds seem to use a note that is unfamiliar, baffles one to distinguish by day, so that identifica-by the sound alone is difficult. The light, cheery of the hair bird is familiar as it passes overhead ely out of reach, but that clear, tantalizing whistle ng from near and from far may be of the bobolink riole—who can tell? Beyond the St. Lawrence herly is no great stretch of settled country, and nce comes the vast multitude that is nightly for six ght weeks en passage? And are there other silent lers? What note has the robin, blackbird, song row, grosbeak, catbird? Why so slight variety? here a universal migratory call, to keep the whole horde, scattered by darkness, true to the southern se, as it were to march by touch of elbow? And if t by night and food and rest by day be the rule, what e passers south from the New England shores? At k Island I hear the same familiar sound fading in the dim south, and can but wonder what of the on the morrow, and where will the final landing be? d and endurance must here struggle with hunger sleepless days, or a tiny form must drop lifeless the great sea. Bird migration is a great mystery leads to much speculation. Cannot correspondents OREST AND STREAM take it up to advantage?

J. QUAY.

Anomalous Appetites and Affection.

R. E. BRINKER, of Central City, W. Va., a merchant nquestionable veracity, declares to having owned a e that would eat live mice with as much relish as a oes, and with a mighty sight greater dispatch. This t all. A chicken could not come within tempting nce or its life would pay the forfeit of its temerity. would devour a hen, feathers and all. He would mice from the hand. He was in no respects vicious. knew a magnificent Norman stallion that would ume tobacco in such quantity as would astonish I have a male cat that beats anything of the feline r in the variety of his menu. Bananas, pawpaws, cucumbers, raw potatoes, sweet potatoes, green un-ed corn, raw tomatoes, etc., were a portion of the on which he grew and thrived.

rhaps not less peculiar than this was the affection notherly care of a hen belonging to Mrs. Metcalf, of ral City, W. Va. This hen, I think, was of the Leg- variety. During the whole year she did not evince east desire to start a family. But after one of her s had left the brood which she thought sufficiently to take care of themselves, the former adopted them estowed upon them all the foster-motherly care that d be desired. She would hover them, and call them lucking, and strange to say, she grew thin in flesh quite pale. I wonder if she surmised that some of ggs that gave birth to some of those chicks were of aying?

N. D. ELTING.

Here is a Chance for Bears.

ERTFORD, N. C., Aug. 19.—*Editor Forest and Stream:* farmers in the section known as "Up River" are plaining that their crops of green corn are being oyed by bears to an extent almost unheard of; three to six good-sized bears enter the fields every t and feast on "roasting ears." Our pack of bear ds having been killed out, and having no others enough to take their places, the owners of the fields resorting to "set guns" with little result as yet.

has been an extremely wet summer, and the bears near the shore, on higher land than usual, and re missing the fun of hunting them for want of

Game Bag and Gun.

The "Brief's" Pictures.

THE illustrations in the current edition of Game Laws in Brief, Mr. Charles Hallock says, well represent America's wilderness sports. The Brief gives all the laws of the United States and Canada for the practical guidance of anglers and shooters. As an authority, it has a long record of unassailed and unassailable accuracy. Forest and Stream Pub. Co. sends it postpaid for 25 cents, or your dealer will supply you.

A Grist of Things.

OCCASIONALLY something appears in FOREST AND STREAM which seems to demand an immediate answer; but the cares and worries of everyday life intervene, indolence and inertia grow with the years, and procrastination steals another opportunity. Forbearance has, however, ceased to be a virtue, hence this ultimatum.

Some one writes that the raccoon can be trapped in only one way; that all other methods are absolutely worthless. "If any one ever told you he trapped a coon in the woods, he told you what never happened," etc. There are several people in this world of ours besides the interesting correspondent just quoted; and as Uncle Remus remarks: "Ole man K. now all died las' year!"

I studied this art of trapping furred animals in my younger days, and some three or four years since bought a small kit of traps, and together with my son Bruce—now a soldier of the First Montana Infantry in Manila—started out to thin the ranks of the chicken thieves and other vermin along the Colville River, near our home; and among the animals trapped were some hundreds of muskrats, fourteen minks, four coons, one skunk, two cats (domestic), and a dog. The coons were all caught by myself, and were all caught in the timber; and it was no great performance either.

Even though, as Mr. Mather so charmingly insists,

"Ole Misser Coon's a cunnin' t'ing,
He ramble in de dark;
Nuffin' seem' to 'sturb his mine
Till he hear ole Ringo bark"—

yet he will put a foot in a trap if the trapper is master of his trade. All these coon traps were set on dry land, and all were baited. So much for "Misser Coon."

In Mr. Burnham's very interesting account of his trip to the Klondike, I read of his difficulty in finding coarse feed for his horses in the terrible struggle with the hardships of the mountain pass; and I, together probably with many other men familiar with the wilderness, wonder why so intelligent a man did not observe the cottonwood bushes along the trail, and offer the hungry animals the benefit of this useful "browse."

Strange, indeed, how the useful little things of life elude observation. Possibly I myself would appear still more stupid and awkward to him or any other city resident who should catch the old uncle in town trying to ring up somebody on the hello machine. Every man to his trade. I'd rather try to trap a coon any day in the week.

And how strangely true it is that human life so often hangs suspended by some attenuated thread of circumstance. How very certain it is that Lieut. De Long's party of explorers would have escaped the perils of the Siberian wilderness and returned safely to country, home and friends, had they left one-half their rifles and ammunition at the ship, and taken instead an equal weight consisting of a shotgun and its ammunition.

The plan of walking round the arctic hare in narrowing circles, as it sat upon the snow, would have suggested itself to some one of the starving adventurers; and instead of straining their trembling nerves and snow-blinded eyes in a vain attempt at a successful rifle shot at the vanishing mass of white, with no help from the dazzling background of snow, the scatter gun would have made the daily hunt a daily pleasure, and brought food, comfort and joy to the hungry camp.

In this connection I want to tell of a plan to circumvent the jack rabbit which evolved itself from my inner consciousness the first time I tried a shotgun on the speedy brute. This plan may be common enough now in places where the jack rabbit is plentiful, yet as I have not been familiar with this race horse of the plains for many years past, I do not know that such is the case, and I hereby ask those of the readers of FOREST AND STREAM who live in a country similar to the one where I made his acquaintance to try this plan and report results.

I do not know of any one else ever trying it, but it will work to a charm if worked properly. There must be no "hobble," however, or the silly creature will see through the gauzy sham. It can be worked only in a country where the grass is short enough to keep the fleeing animal constantly in sight, and over a plain level enough to admit of this also, for the whole stratagem depends upon this one thing.

Go alone, leave the dog at home, and when you jump a jack too far off for your No. 6s, note the direction of his flight, and if you see a slight rise of ground likely to hide him from your view, run to that soon as you can—you only need to be sure that you can see clearly over the face of the country beyond—then stop and watch him carefully. Before he stops you will note that he is about to do so by his slower, shorter jumps, and uncertain manner, as though he were about ready to sit up.

The moment you see this, two things are to be done on the instant; and the result will demonstrate whether you indeed have the sharp eyes and keen instincts of the hunter, or are only a "numskull" gunner who wouldn't become a hunter in a thousand years. Mark instantly with your eye, by the configuration of the ground, and by the surrounding objects, the identical spot where you see the rabbit making those slow, hesitating jumps, so that, were you to close your eyes for half an hour, you could upon opening them detect the spot instantly—and drop completely from sight before he sits up. If you can do these things correctly and on time, the jack is yours. Of one thing be assured, he must not see you when he sits up and looks back, which he is now stopping to do.

Lie quietly, just as you are, for ten or fifteen minutes. Don't be in a bit of a hurry. And when finally you rise up the jack will be nowhere visible. After he has looked for you for a long time, until he is satisfied you are not pursuing, he will crouch in the identical spot where he sat up, lower his long ears and vanish.

Now pick out the spot where last you saw him, and advance—not directly toward him, but as far from it as will bring you in good fair shooting distance when opposite. You will see no rabbit until you get squarely opposite the spot and turn directly toward him, and take a step or two more.

Up, from out the very earth apparently, will rise a pair of ears like palm leaves, surmounting a streak of vanishing gray, and—now's your chance!

STEVENS COUNTY, Wyoming. ORIN BELKNAP.

Reminiscences of an Old Sportsman.—XIX.

WHILE Ethan and I were discussing the suicide of the partridge, we walked along the bank of a dry ditch that was some 3ft. in depth, when Phil came back to us along the bottom of the ditch. When he was nearly opposite us he started to get out of the ditch, but with a sharp cry sprang back again and came out on our side, and stood there whimpering and rubbing the side of his nose with his paw. We were wondering what was the matter, but did not have long to wait before we found out, or at least I did, for a yellow jacket gave it to me in the neck red hot. When I screeched and vigorously slapped the torment you should have seen that dog, as with an inquiring look he came to me and touched me with his nose, then with quickly vibrating tail and open mouth he actually joined with Ethan in laughing at my mishap. There could be no mistake about it, Phil understood the matter, and plainly showed by his actions that he thoroughly enjoyed it. Not the least interesting part of the performance was the behavior of Gipsey. She was only a short distance from us when Phil uttered his cry, and she at once stopped and gave him an inquisitive look; but when I received my dose she came and sitting down as close to me as she could get she fixed here wondrous brown eyes upon my face and sat there the very incarnation of sympathetic sorrow. Ethan pronounced it the most wonderful exhibition of the kind that he had ever witnessed. He then proposed that I should stand on the bank of the ditch while he stirred up the yellow jackets with a pole, just to see Gipsey perform, but I told him that it was cruel to play upon the better feelings of even a dumb brute, and that I could not conscientiously allow myself to consent to anything so wicked as this. The remainder of the day passed without further incident worth mention, and at night we returned to our stopping place with full pockets, well satisfied with the result of our day's tramp through this newly found sportsman's paradise. The country was not nearly so rough as we had been led to believe when we first saw it, and the covers upon the whole were very satisfactory, although some of them were rather dense, but, as Ethan well said, plenty of birds will smooth the roughest ground, and good shooting will denude even briers and brambles of their thorns. In this connection I have often found that good work by the dogs and not least in the category, congenial companionship, will also often cause us to remember with pleasure country and cover that otherwise would be recalled as drear and forbidding.

Ethan had good cause to remember this trip pleasantly, for I laid myself out to make the occasion an agreeable one, and both of us had a most enjoyable time. Ethan shot like a hero, killing nearly, if not quite, two-thirds of the bag. This alone would have made him supremely happy, for he was somewhat inclined to be a bit jealous in this respect, and always appeared to be a little down in the mouth when any of his companions had the better of him in shooting. Although he and I were the best of friends, and he freely admitted that I could beat him out in heavy cover, I knew that he thought himself at least my equal in open shooting, and I was entirely willing that he should, for, with two or three exceptions, I never had any feeling whatever so far as beating a companion or being beaten by him was concerned, for I always enjoyed going afield with a comrade who could perform his part in an artistic manner.

In addition to plenty of birds and good shooting our trip was most enjoyable in every respect, with not one disagreeable feature to mar our pleasure. The second day we devoted to exploring some very promising looking country that we had seen the previous day, finding plenty of grouse and quail, but no woodcock until nearly night, when we found nine in a little springy spot of less than an acre, at the head of an alder run. The first one we found gave us quite a turn, in fact this performance was the only really exciting incident that came to us during the day. Old Tip pointed just inside the edge of the cover, and as Ethan went to her he stepped squarely over a woodcock that got up behind him, and before it rose as high as his head the bird went in a circle completely around him and not more than 2ft. from him, and then flew down the run and settled some 20yds. away. I had a clear view of the whole performance and enjoyed it immensely. When he first turned around he caught sight of the bird, going, as he thought, in the opposite direction, and he again turned with the bird, but not quickly enough to catch up with it, and he never saw it again, although he looked in every direction, including straight in the air. It was worth a long journey to see the expression upon his face during the whole performance, especially when he realized that there was anything funny about it, as he did at once, for he well knew that I did not go into convulsions in that manner unless there was something worth laughing at.

The next morning we bade adieu to our host and drove north, nearly to Hop River, rounding out our trip with some capital sport among the grouse and quail. At 1 o'clock we returned to the team for lunch, and then smoothed out the plumage of our birds and laid them

side by side in the box. There were forty-three partridges, twenty-two woodcock and fifty-nine quail. This we thought a pretty good showing for the time we had been out, to say nothing of the pleasure and fun that we had, and we decided that, taken all together, this was one of the most enjoyable trips that we had ever taken. We started for home shortly after 2 o'clock, driving to Willimantic, where Ethan had business that he said would detain us about fifteen minutes, but we did not get away from the place until after 8 o'clock in the evening, but we had a good dinner, and were familiar with the road, so we jogged along, shortening the journey by shooting our birds over again and commenting upon the many pleasing incidents of our trip, until we had passed the little village of Howard's Valley, and were not more than ten miles from home when there was a sudden crash, a vicious lurch of the wagon, a frantic yell of whoa from Ethan, and then we found ourselves and belongings piled in a promiscuous heap of men, dogs, guns and crook-neck squashes in the ditch. Our host had loaded us down with all the squashes we could conveniently stow in the wagon, and they proved to be most useful upon this occasion in adding variety to the performance by getting up on end and then jumping on us after we were down. The horses behaved nicely—Ethan said they were used to it—and we soon regained our feet and proceeded to strike a match and take account of stock. The roll call showed that none were killed, wounded or missing, and a casual glance at the pile in the ditch led us to believe that the baggage was all right, so we struck another match to see if we could throw any light upon the cause of our trouble. Investigation showed that the near forward wheel was most decidedly off; it had got into a hole, and every spoke was broken short off at the hub. Both of us had had considerable experience in matters of this nature, but nothing just like this had ever come to either of us, consequently we had no precedent to guide us. After promenading around the wreck two or three times and scratching our heads we were about to surrender to the overpowering odds, when Ethan remarked that if it had only been a hind wheel we could fix it with a fence rail. This gave me an idea, and I proposed putting a hind wheel in front, and then proceeding according to the usual custom in vogue when a hind wheel collapsed. Ethan fell in love with this idea, and taking the wrench from the seat box we soon made the change with the wheels, and finding a pole about 15ft. long on the fence we confiscated it and tied the butt on top of the forward axle, then fastening it underneath the rear one we repacked the wagon and were all ready to start. It was past 10 o'clock when we got under way, and our progress was rather slow, but we were happy, and really had a pleasant time, if we did make a night of it, for it was 2 o'clock in the morning when we arrived home.

SHADOW.

[TO BE CONTINUED.]

Sport in a Box.

WHEN the train for Cape Cod left the Old Colony station, in Boston, one morning early in September, it carried two young fellows bound for the famous flats at Chatham, one of the finest grounds for plover shooting on the Atlantic coast. We were going to Capt. Gould's, the well-known hostelry for sportsmen, situated on the edge of the great flats, and only accessible to pedestrians or vehicles at low tide, being cut off from the mainland by a winding arm of the sea. In our kits, besides guns and waterproof clothing, we each carried 500 loaded shells; for, should the birds fly usually well, we expected during our two weeks' outing to use from thirty to fifty shells a day.

We reached the Chatham Branch early in the afternoon, and a few minutes' ride from the junction brought us to quaint and quiet old Chatham, where the "gunners' bus" was awaiting us. As the tide was already on the point of turning, the driver hastened the pace of his sleepy team as much as possible, but after all we had to put our feet up on the front seat while crossing the ford and hold our luggage in our laps, while the incoming tide surged through the body of the wagon, and would no doubt have floated it like a boat had it not been for the heavy cast-iron wheels, with their wide flanges, each weighing over a hundred pounds. Down on Cape Cod the people would rather use iron wheels and ford, as their fathers did, until the millennium comes than build bridges. They live so largely in the water anyway that a little matter of 4 or 5ft. of tidal current doesn't disturb them or their horses in the least.

Just after crossing the ford the keen-eyed driver spied a yellow-leg far down the edge of the channel, and halted his team while Chandler put his gun hastily together, snatched a couple of shells and went stooping along the edge of the water, with long, cautious strides. The big yellow-leg ceased feeding after a few moments and raised its head apprehensively. But the strange object so silently approaching seemed still too far away to be dangerous, and the bird began to feed again. Chandler raised the hammers of his gun and lifted it half-way to his shoulder as he stole noiselessly on. There was a sudden, warning flirt of the bird's wings. The gunner stopped in his tracks and threw up his gun. A puff of smoke and a sharp report just as the bird raised off the sand, and we shouted exultantly as we saw the yellow-leg fall back lifeless, killed clean at 60yds. by the long-range choke-bore.

"That ought to be a starter for the luck of the trip," said Chandler, as he came back with his plover and tossed the bird into the bus.

A warm welcome from Capt. Gould, and an equally welcome meal from the hands of his wife, put us in good spirits and good condition for the evening shooting; and at 4 o'clock we donned our hip boots and canvas suits and started for Box 4, the blind assigned to us for that evening.

Plover shooting on the flats is done from boxes sunk in the sand, and provided with low bench seats, where the gunners may comfortably sit, with their guns upright between their knees, and their eyes on a level with the edge of the box, so that they can see approaching birds. In front of each box, with its sloping rampart of sand, are fixed about a dozen wooden decoys mounted on sticks that are stuck in the sand. The novice is seldom allowed to put out his own decoys, as much depends upon their natural position and arrangement. They must be grouped properly, with heads all pointing in the same general direction, and bodies slightly inclined, as if in the act of feeding.

Two gunners are generally allotted to a box, one keeping watch on the right and the other on the left of the box. Each is provided with a caller, a small tin whistle, which, in the hands of an expert, is capable of imitating exactly the mournful, tremulous whistle of the flying plover. When either gunner sees or hears a bunch of birds approaching he calls softly, "Mark right!" or "Mark left!" as the case may be; and then both gunners lie low and ply their callers as seductively as possible. If the sportsmen are well concealed, the decoys properly placed, and the callers used to good advantage, an approaching bunch of birds, unless recently fired into and badly frightened, will always wheel and either alight just outside the decoys or hover suspiciously over them. The usual method with gunners after a "big bag" is to allow the birds to alight and bunch, and then give them two barrels on the sand and two more as the survivors rise on the wing. Destructive as this method may seem in theory, the novice will find that it takes many a day of practice before deceptive distances on the flats can be so accurately measured by the eye as to insure a successful pot shot. The more sportsmanlike method of shooting single birds on the wing is often the more successful method at first, as a bird in the air does not deceive the eye like a bird on the flats.

No sooner had Chandler and I made ourselves comfortable in Box 4 than a double report from Box 1, far off on the right, told us that the evening flight had begun. The bunch of birds into which the gunners in Box 1 had fired, apparently while on the wing, swung in alarm far outside of Boxes 2 and 3, but returned to the waterline in time to be attracted by our callers and decoys. There was a swish of wings over our heads, and the whole bunch wheeled and dropped gracefully a few feet in front of our decoys. They proved to be stibbs, a comparatively small grayish plover, excellent eating, but hardly large enough to waste shells upon in singles. So we let them bunch, and with four barrels secured eighteen; the rest even hovering around the decoys after they got on the wing, and offering us another chance, which we refused to take, as we considered that we had stibbs enough for that day's bag.

Next followed a bunch of peeps, smaller even than the stibbs; and we let them light among our decoys and go away unmolested.

"Here comes a bunch of rose-breasted plover!" exclaimed Chandler, excitedly, a few moments later. "You take the first and I'll take the second."

We had hardly time to spring to our feet, as the beautiful rose-breasts skimmed by, utterly unmindful of our decoys. Here was a chance for sportsmanlike work. The two guns cracked almost together, and both plover whirled over in the air and came drifting down on the flats—as pretty a shot and as pretty a brace of birds as one might wish to see. The rose-breasted is one of the larger varieties of plover, though not among the largest. It is perhaps the most beautifully colored of all, is comparatively rare and difficult to decoy, and is always counted as a special prize in the gunner's bag. We were accordingly highly pleased at bagging a brace of these birds.

The tide now being at its height, the flight ceased, and we returned to the hotel. Plover as a rule fly only when the tide is encroaching on their feeding grounds. At high tide, or when the tide is going out, few birds are stirring.

The best flight is in the early morning, for two or three hours after daybreak. In drawing lots for boxes, Chandler and I found ourselves assigned for the morning shooting to Box 10, on the extreme left of the line and some two miles' walk down the flats. Accordingly we were up long before the stars began to pale, ate a hasty breakfast in the kitchen, and started for our box while the night was still black and mysterious about us. How desolate and unearthly seemed the vast flats, as we slowly dragged across them in our heavy hip boots, steering as best we could by the half-obliterated path and the dim outlines of the mainland shore!

After a good deal of wandering and getting set right again, we reached Box 10 just as that first pearl gray tinge appeared in the east, heralding the break of day. The tide had just turned on the flood, and before we could see to shoot we heard the shrill quavering call of bunch after bunch of uneasy plover flitting through the darkness.

As soon as objects became visible the sport began, and for two hours our gun barrels had little chance to cool. Curlews, yellow-legs and sickle bills—the big fellows of the plover tribe—came whistling down to our decoys, and we were almost constantly firing or retrieving till the sun had been an hour out of the sea. After the first few pot shots our bag was so large that we decided to devote the rest of the time to the more skillful and pleasurable sport of trying for singles and doubles on the wing. That was indeed the star morning of the trip in more senses than one. Sport so thick and fast I have never enjoyed before nor since. When we returned to "breakfast No. 2," as Chandler put it, our string of birds was the largest brought into the gun room. It numbered 23 yellow-legs, 4 pigeon plover, 7 sickle bills, 12 curlews 3 rose-breasted, 31 ring-necks and 26 stibbs.

So the days passed, bringing health and strength and happy spirits, as well as royal and memorable sport. The great ocean winds, "fresh from Spain," soughed and roared over the little two-story hotel at night, literally rocking and singing us to sleep; and after the morning's sport in the boxes there were tournaments of clay-pigeon shooting out on the sands, and refreshing naps in wind-swayed hammocks, and merry trips "to town" for the mail, and hauling the nets for bluefish, and a dozen other healthful, happy ways of spending our two weeks' vacation. And when the morning came for us to leave it was with a sense of regret amounting almost to heart-sickness that we bade goodby to Capt. Gould and his wife, and our jolly gunner friends, and intrusted ourselves once more to the iron-wheeled bus on its trainward trip across the ford.

PAUL PASTNOR.

CHICAGO AND THE WEST.

Sept. 2.—Warden Loveday reports rather an interesting state of affairs at Galesburg, in this State. When h looked for the prosecuting attorney to bring suit again Weinberg Bros., whom he had arrested for handlin illegal grouse, the attorney could not be found, and second search did not develop his whereabouts. A le ter has now been addressed to him, and he will now h heard from no doubt. It is said that the birds take from Weinberg Bros. were really killed by some the Galesburg shooters, and that a great many offende would be implicated if all the truth could be brought ou There has undoubtedly been a great deal of illegal shoo ing at that point, and just to show the density of th ignorance of the game laws there, I might quote th following from the local newspaper which speaks of fac as it has found them:

"Hundreds of doves have been shot in Knox coun this year. Perhaps some of the 'doves' were chickens a quails, but hundreds of the real birds have been sho Aside from making good potpies, doves are not wor much. They are not good shooting, and yet some the hunters who have been slaughtering them insist th their only object in doing so is to get them under t protection of the game laws."

As a matter of fact, it is just as much against the la to shoot doves in Illinois, at any time of the year, it is to shoot chickens before the opening day. To sure, I have known of a great many cases where sho ers, some of them members of gun clubs, have made practice of shooting doves, just for the reason that one has ever appeared to enforce the law. Of course, shooters know very well that the habits of the doves such that the shooter often pursues them upon the stu bles, just where he would go after prairie chickens. does not need a dog, and he may often get hedge r or water hole shooting at doves, but the feeding groun of these birds are on the wheat fields. In the opini of many sportsmen it would be much better to prot doves, not all the year, but part of the year, allowi an open season on them of even dates with that of t chicken season. This would prevent the excuse urg above, though, of course, the excuse is to-day absolu ly invalid and illegal. The main conclusion seems to that Galesburg is a good place to watch.

At Ottawa, Ill., this week, suit will be brought the warden against J. D. Towney, for killing ille birds. At Monmouth, last week, three sooners w convicted, one, a negro, going to jail. At Rochelle, Ogle county, an odd case came up. Warden Hizer rested a grave and reverend Catholic priest, wh name shall under the circumstances be kept secret, found he had three illegal birds. The deputy took birds, and told the priest he would see him later. priest hied himself to the justice, and got himself fi and was on his way home again before the deputy got the office to swear out his complaint. This sort of cle al penitence is a good thing.

A great deal of illegal game is now coming in fr South and North Dakota. This week Warden Love seized eleven dozen chickens and six dozen teal, all fr North Dakota. These birds were nearly all spoiled, were thrown away. They had been shipped with ice and were badly packed. In this warm weather ga would spoil before morning if not put on ice. Th is something of a suggestion in this in regard to early opening date. It is nearly always pretty warm the Northwest at Sept. 1, let alone at an earlier dat

There seems to be a sort of misunderstanding, something or other, up in South Dakota about game law, and I am disposed to think they may beli their chicken law "unconstitutional." The Minneap Journal of Aug. 26 says that shooting has proved good in South Dakota, especially along the Bad Ri where one party killed forty-five chickens, another thi another twenty, etc. The birds were shot in brush co along the stream. Inasmuch as the law of South Dak did not open until several days after the reports this shooting came in, it would seem that the law d not go for much this fall in that part of the world hear that there is, indeed, some confusion of the d some thinking that the old date of Aug. 15 still ho It is singular how in a case of confusion like this fellows always take the earlier date.

Summer Skin Hunters.

I have often heard that the residents of the I River country, of Minnesota, have taken the matte the game laws into their own hands, and served no on all game wardens that they would better keep the grass of Deer River. A great many deer and mo are killed there, and I should not be surprised if a a while the wardens disregarded the old-time warning got in there and made some arrests. Much such a of country is that in Lake county, the same State, this week Deputy Warden Helving, with Marshal lien and Jas. Graham, of Two Harbors, went in t and arrested two summer skin hunters in their c near Split Rock, taking over thirty hides of moose deer. The men arrested are Jas. Watson and Dan W and it is said that they have been skin hunting in region for a long time, of course, careless of the g laws. It is stated that they concealed certain of evidence against them by burning the carcasses the skinning.

Mauser Rifles.

The other day I was talking with Opie Read, novelist, and he had occasion to say that he would to get hold of "one of those Mauser rifles that Spaniards used," as he thought it might be a good sq rel gun. Nobody knew where he could obtain the m of indulging this singular fancy, and it was explaine him that maybe he wouldn't need quite so long-rang gun for his squirrel shooting. Yet this week the known firm of Messrs. Hartley & Graham, of New Y city, announce that they can supply a limited quantit the genuine Spanish Mauser rifles, 7mm., with l bayonet and leather scabbard; also cavalry carb same as used by the Spanish army, and also largel the Cubans in the late war. They will also be abl supply the Spanish Mauser smokeless powder cartri

Per contra, the firm is able to supply any one wishing game the U. S. Springfield 45 cal. rifle, with angular bayonet, and cavalry carbines of same description.

Wisconsin Season.

The Wisconsin season on ducks is now in full swing, and though, of course, the shooting is on local ducks, the sport is proving very good. On Horicon, at the other marshes about Winnebago Lake, the redheads are more abundant than they have been for three seasons, and teal and mallards are numerous on all these Wisconsin marshes from Green Bay south to Koshkonong. The breeding conditions have been good. It is also cheering to note that in keeping with the improving times and the better and more cheerful feeling of the people, a great many more shooters are going out this fall than was the case last year. It may truthfully be said that in the West this is a good shooting year in all senses of the word.

The Chicken Harvest.

Now we begin to have reports from the chicken harvest from many corners of the country, and it seems to be undoubtedly true that this is a good chicken year in many parts of the West. I have news more especially from Wisconsin, Minnesota and North Dakota, and in all these States there would appear to have been enough birds to give good sport. Illinois is, of course, still closed. Nebraska comes to the front with a fair showing. South Dakota I take to have as many birds this fall as last.

At Atkinson, Neb., there was fair sport, though the weather the first few days of the season was very warm, as indeed it was over most of the West at that time. Jack Hallowell, Tom Kimball and John Humphrey had good shooting during their trip to that point.

At Fergus Falls, Minn., one is upon what was once a grand chicken ground, and which still can show sport in reason. Messrs. E. A. Jewett, C. C. Warfield and Thos. Roberts made a bag of fifty-eight birds on opening day, which is plenty these days. Others took to the marshes rather than the stubbles, and Messrs. Henry Asseln, George Borne, T. D. Orr, Roy Smith and Harvey Bartelson bagged 161 ducks in the first day's shooting, which is thought to be a great bag at that point.

Messrs. Wm. Rose, Chas. Penninger, Henry Sanford, Frank Schurz, Henry Weber and G. Schmidt, all of Chicago, went to Waubay, South Dakota, and put in a week with the grouse in that locality, which is reported to be a very good one this fall. They got all the birds they wanted to eat and give away, and had 200 to dispose of when they started home. They were taken out by Ellsworth Young and W. B. McLean, of Waubay.

Reports state that a great deal of game, grouse and chickens more especially, is coming to St. Paul and Minneapolis this week over the Northern Pacific, Great Northern and Soo railroads. The number of chickens is placed in the thousands, though of course this is much a matter of guesswork. There seems to be no guessing, but a certainty, in the belief that the fall crop of birds is a very fine one, and that the sport has been good. Chicago dealers are, of course, asking these lucky markets for some chickens, plenty of chickens, any number of chickens. If I had a million prairie chickens here, it is very likely within the bounds of fact to say that they could be sold to-morrow on the Chicago market, for consumption later in the East and on the ocean liners. The lucky Twin Cities, however, are not so unwise as to put their birds on the market, and they hold them for their own State.

At Chamberlin, South Dakota, the sportsmen tried to have the date of Sept. 1 respected as opening date, and this past week they have been finding good shooting in their locality. The dried-up shallow water known as Red Lake, which once was noted for its duck shooting, but which later failed in a droughty season, has again filled up with water from the artesian wells and elsewhere, and the duck shooters think they will have the old times back again this fall.

In northern Iowa, much to the surprise of nearly everyone who saw the rapid diminution of the prairie chickens many years ago in the day of unrestricted shooting, the birds are this year reported to be found in very good numbers indeed, and good sport has been found by those who went out, in the upper tier or so of counties, more especially. The State of Iowa might very well do more for her game and fish than she does. Thus I see it published that State Warden Delavan, of Iowa, has offered a private reward, out of his own pocket, for conviction of any one shooting chickens illegally. The State should furnish the pocket.

In Wisconsin, and well up toward the pine country which marks the limit of the habitat of the prairie chicken, shooters report very good success this week. In Jackson county they say there are more birds than have been seen for years. This is thought to be due to the stricter enforcement of the game laws in recent times. Give the big grouse a show and he will get along.

Fessenden, Minnesota, is one of the points which were tipped strongly by the knowing before the opening of the season, though I do not yet get word from that point. There is good duck shooting near there too. Messrs. E. D. Smythe, Geo. M. Liggett, E. N. Forrest and Walter Herrick, all of Minneapolis, made this point their objective in a trip this week.

I central Iowa also there is a good show yet to get a few chickens, for instance around Webster City, Kamrar and Blairsburg. One bag of thirty-seven is reported (twenty-five birds is the daily limit under the law). This central Iowa country was my own old chicken ground in the earlier years. We used to take a team and wagon and go north, camping out and shooting in the country east of Webster City. In those days the birds were very abundant, and we killed all we wanted without trouble. Yet my father told me that when he first went out into that country there were hundreds of birds to where there was one at the time when I began to shoot. He said that in the early frontier days the birds bred all about the edges of the towns, and people would hardly eat them, they were so common and easily killed. He spoke of one day when a number of his friends went out shooting, and he himself killed sixty birds one afternoon with a muzzleloading gun, often killing eight or ten birds without much more than moving from his tracks. After that one day, he said, he would never shoot so much game again, and I remember I got a very hard training on that sort of thing at the time, when I got big enough to swipe the old gun and steal out now and then for a hunt after school around the edge of town. But those were the days when we had chicken shots, and chicken dogs, too. At that time all central Iowa was dotted with long blocks of unbroken prairie ground, where never a plow had come. On these grass lands the birds bred, and they flew to the grassy sloughs when disturbed in their feeding on the stubble. We hunted them chiefly on the stubble in the morning and evening, but if we were driving across country very often put them up on the grass and then got out and followed them. They did not fly so far as they do now. I can remember what fun it was to watch them as they flew on out over the waving grassy prairie, which to the unskilled eye was very deceptive. A "good marker" was a useful man in a party then. A bit of dark grass, a tall rosin weed or a bright yellow sunflower would serve for a mark, well enough for the trained prairie shooter. That was free, open, unrestrained, pleasurable sport, with no wire fences in sight (nor at that time was any wire fence dreamed of), and it was very different from the selfish and hurried scramble of these days, with all their soonerism and their narrowed range alike of vision and of enjoyment. I wouldn't mind a few days of the old times back again, with the old dog, and the old gun, and the old tutor, who is now a very old man.

Up in Wisconsin they have been doing business with the chickens this week in more places than one. Princeton, and the country to the west of that town, seem to have panned out very well. Messrs. A. Bechaud, C. L. Handt and H. A. Nolte, of Milwaukee, bagged forty birds in a little hunt in that part of the State, and a little further to the south Messrs. W. G. Smith, Dr. Gillett, Wm. Breitenstein and Gus. Gromme, of Fond du Lac, who made up another party, got about forty birds also. In that same region Fred Sexsmith killed twenty-four birds in one day, shooting alone. Mr. Will Diener, of Fond Du Lac, brought in fourteen birds, bagged in one day's shooting. Around Puckaway Lake the duck and chicken shooting has been good. At Horicon Marsh, Percy Stone, of Chicago, made a mixed bag of ducks and chickens on opening day. He says there are, or were at that time, quite a number of birds around the edge of the marsh on the farm fields. He did not speak of any very startling bags on ducks, but thought a man could kill twenty-five or thirty birds on the Diana Marsh, if he cared to do so.

Fooled Brer George.

George Kleinman, one of the best known trap shots of Chicago, was appointed a deputy game warden this year, and he has proved a good one. Yet a couple of folks, who live over near Belvidere, played a low down sort of trick on George. He had caught them shooting chickens, and found a bird in the posession of one of them, but allowed the men to go to town in the afternoon. The first thing they did was to go to a justice of the peace and get themselves tried before the warden appeared. The names of the men were F. E. Lee and L. Fox. Fox complained against Lee, and the justice fined the latter $5, giving Fox half the fine for lodging the information, as the law permits. This $2.50 was then handed to Lee by Fox. Brer Gawge was not consulted, and he was pretty warm over it when he found how things had gone. Not that he wanted the money alone, for I believe he is one of the deputies who are put on salary, and not on the commission of half the fines.

The Duck Season.

The southbound flight this year appeared on the Texas gulf coast at an extraordinary early date, namely on Aug. 23. A great many birds have since then been dropping in, and by this time, I suppose, the Texas duck season is on to greater extent than ours is in this latitude. It is not known where the ducks bred that make this early Texas flight. They are mostly marsh ducks, sprigs, teal and mallards, and may have nested even below the 42d parallel. These birds often move directly on south as soon as they begin to be disturbed, and work up and down according to the condition of the weather in the fall and winter.

The Wisconsin law forbidding shooting before sunrise or after dark seems to have been violated with great uniformity and enthusiasm pretty much all over that State, so far as one may learn. On Puckaway Lake the sooners began pounding out the ducks well before the opening day, and the result of this was seen on Fox Lake and adjacent waters, on which the birds took refuge. On Beaver Dam Pond the shooters could not wait till dawn, and gave the ducks a brushing up by moonlight. The warden took some names. As to what the poachers did up Waupun way, on the grounds of the Horicon Shooting Club, I wasn't there, but I will cheerfully bet that a dozen guns were at work before the sun had kicked off his foggy blankets on Sept. 1. It is very tempting to shoot when the best of the flight is on, but really nothing drives away the birds from a marsh quicker than this shooting at them when it is dark. A good and business-like market hunter will not do that, nor allow anybody else to do it on his shooting country, if he can help it.

Warm weather has spoiled the sport of the members of Long Meadow Shooting Club, of Minneapolis, whose preserve is located on the Mississippi River bottoms within a buggy drive of the city of Minneapolis. Strange as it may seem to the unadvised, there is on this valuable club preserve a very fine and well stocked duck marsh, where the birds breed annually in very large numbers. There will be good fun there this week and next. A bag of a couple of dozen birds is a common thing there, mostly of marsh ducks, teal, mallards, etc.

The famous country of lakes and marshes and fields in Douglas county, Minn., is this fall in elegant shape, and the Alexandria lakes will have plenty of birds for any reasonable demands. At Wheaton, Minn., there seems to be a great game country, as it is stated that 8,000 ducks were shipped from that one point last year, and this is but a small part of the total from that vicinity. There are chickens in there also.

The wood duck crop on the Kankakee, in Indiana, is now pretty well harvested. A few jack snipe are coming in, and the yellowlegs are beginning to leave and go south. It is not thought that we shall have any duck shooting on this marsh this season, of any consequence. John Watson is anxiously inquiring for some jack snipe country, but he thinks he is going to get left this fall.

Ohio Big Game.

The following I find in the dispatches, dated Bloomdale, O., Sept. 6:

"The annual hunters' party was held here to-day at the armory, 150 hunters and hunters' wives participating. The pelts of deer, lynx, panthers and smaller game, stuffed heads and birds, were displayed as the product of several years' hunting. A deer from the garden of Andrew Wiseman, of West Independence, was loosed and the woods scoured for it. It was hunted down by forty hunters, and served at the banquet to-day."

Colorado Big Game.

The State Warden of Colorado still thinks that the reports of a bunch of buffalo near Steamboat Springs is correct, and he has sent two deputies into that country to keep out a watch for these animals. They are reported far up in the mountains in a region little traveled.

Mr. W. E. Warren and wife, of Fox Lake, Wis., have this week gone to the Gunnison country, Colo., for a visit at the ranch of Mr. Geo. Lightley, where they expect to get deer and trout, if nothing bigger.

1200 Boyce Building, Chicago, Ill.

The Ottawa Club Game Register.

Cleveland, O., Sept. 5.—*Editor Forest and Stream:* Enclosed please find a copy of our "Game Register" of the Ottawa Shooting Club, showing totals of different species of ducks shot each year from 1880 to 1886 inclusive. Some time in the future I will send you a copy from 1886 to date.

The Ottawa Club was organized in 1871, with seventy-five members. In 1892 the membership was reduced to fifty members. The club owns 4,000 acres of marsh and farm lands on the head of Sandusky Bay and along the Sandusky River. The club house is situated on the Sandusky River, about five miles from Sandusky Bay, on what was formerly known as Hone's Point.

The season has just opened (Sept. 1) and there were more ducks (mostly blue-winged teal and mallards) on the marshes than have been seen on Sept. 1 for about five years back. Our Ohio laws do not allow shooting on Sunday or Monday, and only from 5 A. M. to 6 P. M. the rest of the week. The indications are that the shooting will be excellent this fall. There were thousands of jack snipe and plover on the marshes. I saw jack snipe in flocks as high as ten, which is seldom seen. I seldom shoot any other game while hunting ducks; if I had had small shot with me on the 1st I could easily have killed fifty jack snipe without leaving my duck blind, as I was located right in the middle of a large mud flat, with just enough water on it to suit snipe and plover. It was a great sight to see plentiful.

We account for the large quantity of game in our marshes by the fact of our having built two dams at the mouth of streams running through our marshes, which keeps the water at a good depth over about 2,000 acres. This has made plenty of duck food, the marshes being full of wild celery, arrowhead, mosses and wild rice.

We have also kept the German carp out of our marshes pretty well, by having them seined out at the dams and at the mouths of the streams flowing out of the marshes. Before we did this, the carp ate or destroyed the duck food. We used to have fine big-mouthed bass fishing in the Sandusky River, but since the German carp got into it the bass have disappeared.

Game about Gettysburg.

Gettysburg, Pa.—Pheasants will not be very plenty in our hills this fall, there are too many foxes, which destroy the nests and young birds. We have no bounty on fox scalps, and small game is steadily getting less every year. I hear of more partridges over the country than for several years, and if our sportsmen would leave them alone for a few years they would get very plenty again.

From different accounts, I have heard that deer will not be very plenty this winter in our mountains. Every family in the mountains have their dogs, and they kill more deer (especially the does) than the hunters, which accounts for the scarcity.

F. M. B.

Any Old Way will Catch a Coon.

Editor Forest and Stream:

I think the author of the article on "Trapping Coons" must have been "just funning," as the boys say, when he makes the assertion that there is "only one way to catch a coon" in a trap; for if there is any animal wearing hair or fur that goes around "hankering to be caught" it is a coon of the ring-tailed variety. I have never seen a trap of any kind set for one which, if strong enough to hold him, wouldn't catch a coon. In my boyhood days I have seen them caught in boxes set for rabbits at holes in the fence; I have seen them caught by the score in log traps set across fallen trees in the swamps, and by the way that is the darky's favorite way of trapping them. I have seen them caught in steel traps set several feet from the ground on some fallen tree across a stream. They are frequently caught in what is known as a deadfall—two slabs or puncheons, one laid flat on the ground, the other set above it with an ordinary Fig. 4 trigger, a weight being attached to the top piece to hold the game when once in—the trap being baited with either a piece of salt fish or a handful of ripe persimmons. In fact, they are so easily caught that by leaning a good stout pole against a persimmon tree, which the coon is in the habit of visiting, and setting a log trap across the pole, after he has become accustomed to the sight, it is no trick to catch him.

A farmer friend of mine, whose corn in a field adjoining a swamp was being destroyed by coons, after examining his fence found that most of the marauders entered the field at one place through a hole in the fence, made by a broken rail in the "old Virginia rail fence." Knowing the nature of the animal, and trusting to their simplicity, he merely removed the broken rail, drove two stout stakes on either side of the fence, so that the upper and lower rails would come together true and plumb, lifted one end of this improvised trap and set it with an ordinary Fig. 4, and for four consecutive mornings took a fine fat coon from the fence, and they were not all "young and foolish" either, for it comprised the whole family.

I have seen coons caught in almost every way except the "only way to catch a coon," as laid down by the writer referred to above; but do not for a moment doubt they can be caught that way, as they certainly can be caught almost "any old way." A. F. R.

HERTFORD, N. C.

The Huntsman's Green.

WITH the progress of the deer-hunting season in this State come in the usual reports of hunters shot by other hunters, who were sufficiently stupid or rattled to mistake them for game. An exchange suggests the wearing of a scarlet coat by each sportsman. This, however, would be as good a danger signal to a deer as to a shooter.

A colored coat probably would give the best protection, but green would be a better selection. It is the huntsman's own color, and it seems hardly possible that the most verdant gunner would suppose he had spied a bright green deer; while the animal would not be alarmed by a glimpse of so familiar a shade.

If the deer-hunter is looking for a protective uniform he would better conclude, with the milkmaid of the story, that "green becomes his complexion best, and green it shall be."—Syracuse Post.

Indiana Shooting Outlook.

WARSAW, Ind., Aug. 20.—The woodcock season has proven a failure, these birds being practically exterminated in this county. The same can be said of pinnated grouse, snipe and ducks. There is, however, a promise of fair quail shooting in November. MONOQUET.

PRIZES FOR AMATEUR PHOTOGRAPHS.

THE FOREST AND STREAM offers prizes for meritorious work with the camera, under conditions which follow:

The prizes will be divided into three series: (1) for live wild game; (2) for game in parks; (3) for other subjects relating to shooting and fishing.

(1) For live game photographs three prizes are offered, the first of $50, the second of $25, and the third of $10.

(2) For live game in parks, for the best picture, a prize of $10.

(3) For the best pictures relating to FOREST AND STREAM's field—shooting and fishing, the camp, campers and camp life, sportsman travel by land and water, incidents of field and stream—a first prize of $20, a second of $15, a third of $10, and for fourth place two prizes of $5 each.

There is no restriction as to the time nor as to where the pictures have been made or may be made.

Pictures will be received up to Dec. 31 this year.

All work must be original; that is to say, it must not have been submitted to any other competition or have been published.

There are no restrictions as to the make or style of camera, nor as to size of plate.

A competitor need not be a subscriber to the FOREST AND STREAM.

All work must be that of amateurs.

The photographs will be submitted to a committee, who, in making their award, will be instructed to take into consideration the technical merits of the work as a photograph, its artistic qualities, and other things being equal, the unique and difficult nature of the subject.

Photographs should be marked for identification with initials or a pseudonym only, and with each photograph should be given, answering to the initials, the name of sender, title of view, locality, date and names of camera, and plate or film.

Sea and River Fishing.

Proprietors of fishing resorts will find it profitable to advertise them in FOREST AND STREAM.

Where to go.

ONE important, useful and considerable part of the FOREST AND STREAM's service to the sportsmen's community is the information given inquirers for shooting and fishing resorts. We make it our business to know where to send the sportsman for large or small game, or in quest of his favorite fish, and this knowledge is freely imparted on request.

On the other hand, we are constantly seeking information of this character for the benefit of our patrons, and we invite sportsmen, hotel proprietors and others to communicate to us whatever may be of advantage to the sportsman tourist.

Remarkable Rod Fishing.

SANTA CATALINA ISLAND, Cal., Aug. 7.—The present year has been a remarkable one in the annals of rod and reel fishing in southern California. Tuna fishing has become a regular pastime, and now the black sea bass fishing with rod and reel, which was for a long time considered almost impossible, is an every-day affair, and almost every catch brought in this season is taken with an ordinary tuna or tarpon rod and a 21-thread line.

How remarkable this is may be realized when it is known that a fish weighing 324lbs. has been recently brought to gaff by Mr. Frank V. Rider, of New York.

The black sea bass is very plentiful about the island,

MR. FRANK V. RYDER'S 324LBS. BASS.

and is in season from April to October. That is, it bites best at this time; but if fished for can be found in schools in winter. The spawning time is in July and August, and at this time the king of the bass tribe (*Stereolepis gigas*) is found in water 20 to 30ft. deep within 150ft. of the shores of the rocky island. Here on the edge of the kelp beds the cast is made. The tackle advocated by the Tuna Club is a bass rod or any fairly light rod, a 21-thread line and a wire leader about 7ft. in length. For bait a live whitefish 4 or 5lbs. in weight, or a large piece of yellow rail or barracuda is used. The bait is anchored to a buoy, which is taken into the boat and held ready to throw over at the strike. This is exactly the reverse of that of the tuna. The fish fumbles at the bait, takes it up and drops it, finally swallowing it. The strike is made when about 10ft. of line has slowly gone over, and then the sport begins in a tremendous fast rush that will take from 200 to 400ft. of line. Then the leather pad brake in the hands of a strong man will stop the rush, and for perhaps half an hour or an hour the play of the fish is a fine exhibition of power and cunning. And here is the difference between this fish and a tuna or tarpon—for a short time it fairly equals them, but it has not the staying powers, and is generally killed in from half an hour to an hour, while in all probability a tuna of like size (say 250lbs.) could not be caught with rod. But fishing for this great bass is rare sport, as Mr. Beard can well testify, having fought one to the finish off San Clemante, killing it, if I am not mistaken, by the light of a lantern.

The late catches have been remarkable, and the record is held by Mr. Rider, who took a 324lb. fish in fifty-five minutes; the party comprised Dr. H. K. Macomber, of Pasadena; Frank V. Rider, of New York, and Jim Gardner, boatman. They fished with two rods, and landed five fish, Mr. Rider's weighing 324 and 268lbs. Dr. Macomber's weighed 256 and 109lbs., while another fish weighing 251lbs. was a joint catch. The bass having taken both their baits rushed off in a manner th completely deceived them, so that each man thought had a fish; but at the end of fifteen minutes they h the same fish at the surface; and the combined effo was too much for him. The weight of this catch w 1,211lbs. Mr. Rider landed his 324lb. fish in fifty-fi minutes. It was 6ft. 2in. long, and 4ft. 9in. in gir Mr. Rider landed a 170lb. fish in twenty minutes. I Macomber landed a 140lb. fish in nineteen minutes, a a 130lb. fish in thirty minutes, these being a catch another day.

I once played a bass for twenty-five minutes, and t work was so violent to keep the fish out of the ke for which it was heading, about a quarter of a m off shore, that I was completely exhausted and su rendered rather than overstrain myself. Dr. Macomb took my rod, but even then could not stop the fish. reached the kelp bed, towing the heavy boat, and bro the line. The largest fish escape, and they have be taken here weighing 800lbs. on a hand line.

Some of the other rod catches for this season are follows: Dr. W. R. Bently, Seattle, black sea b weighing 252lbs., in two hours; rod 11oz.; line strand cuttyhunk. As this is written Dr. H. H. Pe has brought in a 374lb. bass, caught on the same tack in one hour. Other catches are: Gail Borden, N York, 168lb. bass; C. A. P. Tarbutt, London, 268 a 193lb. bass; F. V. Rider, New York, bass as follo 208, 326, 253, 251, 109. Dr. F. Stattuck, San Francis 190, 180, 208lbs.; all taken on 21-thread lines, and usua within one hour. SENOR X

Colorado Fishing the Best.

SANTA FE, New Mexico, Aug. 29.—I wish to rel to the readers of FOREST AND STREAM a brief story of recent trouting experience in Colorado.

Last October I spent nine days wandering along Rio Grande River, in Colorado. I caught large tro using small gray and brown hackle flies as a lure, a I lost many large trout through the small hook tear out of the fishes' mouths.
